2. Lepra alploides. In this form of lepra, the fcaly patches are fmaller than in the lepra vulgaris, and have their central parts a little depreffed. The eruption ufually begins about the elbow, with dillinct, hard, protuberances, not much larger than pimples, and of a dull red colour. Thefe, in a fhort time, dilate to nearly the fize of a filver pemy : two or three days afterwards the central part of them fuffers a depreffion, within which minute white feales may be obferved. The furrounding border, however, fill continues to be raifed, but it retains the fame fize, and the farne red colour as at firit. All the fore-arm, and in many cafes the back of the hand, is fpotted with fimilar patches, which feldom become conflueat; but there is fometimes a white incruftation round the point of the elbow. This eruption appears in the fame mainer upon the joint of the knee, but without fpreading far along the thigh or leg. It rarely, if ever, appears on the trunk of the body, or on the face.

This is a difcafe of long duration, and not lefs dificcult to cure than the foregoing fpecies of lepra: even when the fcaly patches have been removed by a perfeverance in the ufe of fuitable applications, the cuticle remains for a long time red, tender, and brittle; but the fmall hairs of the flin are not deftroyed, nor altered in their colour and texture, as fome authors have ftated, and as occurs in the leuee. This form of the difeafe feems to bave been ranked by the ancients under the head of white alphos, which Galen afo firms is a flighter affection, and lefs rough than the common lepra. Celfus, indeed, has claffed it (under the generic term vitiligo) with the leucè; but he points out with care the diftinction between the flight alphos and the incurable leucè.

The exciting caufes of this form of the difeafe are pro.
bably

## LEPROSY.

bably the fame as thofe of the preceding ipecies. It chiefly affects wonten and chuldren: and is not unfrequently feen, according to Dr. Willan, in thofe who are employed to drefs Hlax, hair, or feathers.
3. The depra nigricans does not differ much from the keyra vullyaris, with refpect to its form or diltribution; but chiefly in the colour of the patches, which are dark and livid. 'I'hey appear firtt on the legs and fore-arms, extending afterva ads to the thighs, luins, neck, back, and hands: their central part is not deprelfed, as in the alphoides. They are fomewhat fmaller than the patches of the L. vulyaris, and have a livid or purplifh border. The fkin, likewife, appears of a livid colour thro"gh the fcaly incrultations, which are felfom very thisk. It is further to be obferved, that the fcales are more eafily detached than in the other forms of lepra, and that the furface remains longer excoriated, difcharging lymph, often with an intermixture of blood, till a new mocrulation forms, which is hard, brittle, and irregular. This complaint is particularly troublefome when it covers the fealip.

The lepra nigricans affects foldiers, failors, fculler-men; Rage-coachmen, butchers, brewers'-labourers, and others, whofe occupations are attended with much fatigue, and expofe them to cold and damp, and to a precarious or improper mode of dict. Women, habituated to poor living, and conftant hard labour, are alfo liable to this difeafe. It was probably comprifed under the denominations of black alphos (Mtaxs), by the Greeks, and of black albohak by the Arabians (or black anorphea of their tranflators.) On comparing their accounts, however, it will be folind that fome of them reprefent the black alphos as fmooth and fhining, like the leuce ; while others affert that it is rough and fcaly. By this inaccuracy refpecting the llack as well as the whbte alphos, they have led fucceeding writers to conjcin the lepra and elephantiatis, difeafes generically different.

Treatment of Lepra Gracorum. - In the treatment of lepra, the Greek phyficians always premifed bleeding and ftrong purgative medicines; but they feem to have depended chiefly on external applications, fuch as alum, fulphur, nitre, lupines, cabbage-leaves, elm-bark, the dung of goats, mice, and foxes, human urine, and the gall of bears. They likewife ufed feveral vegetable and mineral fubflances, which had a corrofive or velicating quality; as hellebore, colophonia, the roots of white lily, onien, bryony, afphodel, ranunculus, and anemone, the feeds of muftard, and horferadifh, quicklime, vitrinl, \&c. Remedies of this kind, or even blititers, are, however, found to have only a temporary effect, their operation being foon fucceeded by a re-production of the fcaly crults. Liniments, compofed of tar, or of fome mercurial preparations, have been much employed, both in ancient and modern practice, with fomewhat more beneficial effect.

Of all the external remedies, however, which can be employed in the two firlt fpecies of lepra, frequent bathing or voafhing is the molt advantageous. 1)r. Willis was averle to warm-bathing, or the external ufe of any mineral water, from fome theoretical notions, and cenfures efpecially the Bath waters, as having converted many cafes of Dight eruption into a confirmed leprofy. (De Medicam. Operat. fect. iii. c. 7.) It is pretty well afcertained, however, from experience, that not only the waters of Bath, but alfo the Iulphureous waters of Harrowgate, Crofi, Mof$\mathrm{f}_{\text {ac }}$, \&c. ufed both externally and internally, prove very bencicial in many cafes of the lepra. Where the flkin is niot very irritable, much advantage may be alfo derived from baths prepared with a folution of alkalized fulphur, and muriate of fuda; and when the furface is very tender,
fimple ablution with warm water, or bran and water, has the effect of abating the tingling or itching of the fkin, of encouraging the removal of the fcales, and of rendering the fkin fofter and more pliable. Similar effects are produced by the ufe of the Bath waters, according to Dr. Falconer. (See Memoirs of the Med. Society of London, vol. iv.) "The method in general purfued," this refpectable phyfician ftates, " is to order the patients to bathe twice or thrice a week, according to their age, ftrength, and other circumftances. This courfe is accompanied with a direction to drink the waters, which, at a medium, are taken in the quantity of about a pint daily, and are thought thus to fecond the good effects of the bath, by promoting an ealy and genlle perfpiration. If the amendinent appears to proceed according to expectation, no other medicines are given, but occafionally fuch as are opening, if the body be coftive." Dr. Falconer alfo ftates, that the whole numiber of perfons admitted into the Bath hofpital for this difeafe in the fpace of four years, from June 12 th, 1775 , was 83 ; of whom were difcharged 52 "cleanfed," and 24 " much better."

Bathing in fea-quater, Dr. Willan obferves, is a certain auxiliary in the cure of lepra. "It is ufual, and feems proper, firlt to ufe a bath of warm fea-water, till the fkin be foftened, and the fcaly incruftations removed; after which a cure is foon obtained, efpecially in young perfons, by bathing in the open fea. As the difeafe is apt to recur in winter, or in fpring, the fame plan may be requifite for feveral fucceffive fummers; but I have known it, by perfeverance, linally eradicate the complaint. A fimple warmbath," the fame phyfician obferves, "with moderate friction, likewife contributes to remove the fcales, and to produce a foft red Ain, which, in time, regains the ufual colour and texture. This plan is fufficient in the बighter cafes of lepra, without the ufe of internal remedies. If the difeale affects the extremities only, bathing the whole boly is not neceffary; it may be enough to apply fleam, or warm-water, frequently to the difordered parts." Loc. cit.

Of the mercurial preparations employed externally, we learn from the fame author, the muriate, (or fublimate,) and the unguentum hydrargyri nitrati, feem moft efficacious in reftoring the cuticle, after the leprous crufts are removed. He does not, however, think the latter preferable to the tar-ointment, which Dr. Willis and others have recommended. This ointment ghould be well rubbed upon the parts affected every night, and carefully wathed off, the following morning, with warm-water, or with a llight alkaline lotion. We may add, that in flight or incipicnt cafes, where there is much drynefs and an inirritable date of flin, the fcales may be often removed by a fpirituous lotion; and that the thick crufts which fometimes form upon the patches, may be foftened and removed by ftrong alkaline applications. The ufe of the decoctions of folanum dulcamara, or herb bitter-fweet, or of elm-bark, by way of lotion, has alfo been found of confiderable fervice in feveral inflances.

Many internal remedies have been employed and recommended for the cure of lepra, the efficacy of which has not been ftrong!y eltablifhed by fubfequent experience. Refpecting thefe, Dr. Willan remarks, that antimonials, fulphur, and nitre, have not alone any confiderable efficacy; that decoctions of emollient herbs, of guaiacum-wood, farfaparilla, mezereon, or of elm-bark, which have been recommended as fecifics, by no means deferve that character ; that calomel, bydrargyrus ca'ciactis, pilule bydrargyri, or mercurial frictions, applied fo as to produce falivation, do not remove the difeafe; and that the nitrous and muriatic acids, lately recommended in obftinate cutaneous eruptions,

## LEPROSY.

though fucceffful in fome cafes of lepra, have been given in other cales, for three or four fucceffive months, without any manifelt advantage. The tincture of cantharides has often been preferibed for the lepra Gracorum, as on the authority of Dr. Mead; but that phyfician recommended it only in cales of elephantiafis, or lepra Arabum; and it has been found totally ufclefs in the fcaly lepra. See Fatconer, loc. cit. Willan, loc. cit.

The following fubtances may be mentioned, however, as laving evinced confiderable efficacy, when taken internally, in many cafes of lepra. The corrofive muriate of mercury, diffolved in fpirit, and taken in fmall dofes for a length of time, has fometimes proved ufeful ; efpecially when its operation was affifted by fome antimonial, given at the fame time, with any of the decoctions above-mentioned. The caultic potafs in folution, or aqua kali puri of the late difpenfatories, given in the dofe of twenty or thirty drops, thrice a day, in a cupful of any mild fuid, has alfo mani. felted fome influence over the difeafe. But the preparations of arjenic have been employed with more conliderable fuccefs, in obttinate cafes of lepra, both in form recommended by the late Dr. Fowler, and in that of Dr. De Valangin. The dofes of the folution prefcribed by Dr. Fowler are larger than are neceffary. Five or fix drops taken three times a day will be generally fufficient for an adult. We have feen feveral cafes in which the difeafe yielded readily to this remedy. Sze Dr. Willan's Treatife, 2d edit. p. 137, where is alfo an intereiting communication on the fubject, from Dr. Girdleitone, of Yarmouth.

Among the vegetable remedies, the tincture of black hellebore has been occafionally prefcribed by Dr. Willan, its dofe being regulated fo as not to diforder the bowels, and he is of opinion that it has fome efficacy; but not more than the miseral remedies already mentioned. The decoction of the twigs and leaves of the folanum dulcamara (Linno), has alfo been found beneficial in the fcaly lepra, when taken interually, as well as when applied externally as a wafl. Out of twenty-three cafes, in which it was employed by Dr. Crichton, two only refifted its action; all the others were cured. The decoction is now ordered in the pharmacopeia of the College, an ounce of the plant to be boiied in a pint and a half of water down to a pint. Of this decoction Dr. Crichton prefcribed two ounces, at firlt, to be taken every morning, nonn, and evening, but the quantity was afterwards increafed, until the pint was conflumed every day; at the fame time, the patient was ordered to wath the Ikin vith a ftronger decoction of the fame plant, which confiderably accelerated the cure. The remedy feldom begins to cxhibit any evident good effects for the firft eight days.

The remedies above-mentioned are applicable only to the twe firft fpecies of lepra; none of thein being particularly ferviceable in the lepra nigricams. 'Ihis form of the difea!e requires, in the firlt place, a regular and nutritive plan of deet, with moderate exercife : it may be afterwands wholly removed by the ufe of cinchona, and the mineral acids, feabathing, \&c. Willan, loc. cit.

It muft be obferved, before we conchude, that, in the senereal difeafe, circular patchez fometimes appear, which refemble thofe of the lepra nizricans in fize and colour, but which are not incrufted. The drynefs and harihnefs of the Skin, fo remarkable in the lepra rupgoris and alphsides, do not occur in the venercal lepra; ; its patches, when fomewhat advanced, being as foft and pliatle as other parts of the flain. Thefe patches are generally diffinet, and at a diftance from cach other; they feldom exceald the fize of a fhilling; yet it is probable, Dr. Wiitan remarks, that they might acquire a greater magnitude, if the progrefs of the difeafe
were not carly arrefted by the ufe of mercury. As the difeafe yiedds to the influence of this remedy, a circular red fuot appears for fome tine in the place of each decliming patch, and a minute fhallow depreflion, like a cicatrix, is left at the centre; but no permanent difcolouration of the ikin remains, as in fome other cales. If no medicines were employed, thefe, like other fyphilitic eruptions, would at length terminate in ulcerated blotches.
l.epross of the Jesus. The nature of this difeafe, which appears from the writings of the Hebrew legillator to have prevailed extenfively among that people, after they quitted Egypt under his guidance, has been the fubject of much difcuflion, and of conliderable difference of opinion. Some writers have referred it to one of the fpecies of leprofy above-mentioned, and fome to the other; and fome ygain have confidered it as a difeafe peculiar to the Hebrew peo. ple, differing from every malady with which other natous have been aflitict, and feut by Providence upon them, as a fu. pernatural-punifhment. Many of the ancient hiftorians afiert. that the Hebrews were expelled the Egyptian territories, in confequence of the general or even univerfal prevalence of the leprofy among them. Manethon, an Egyptian, who wrote a hiltory of the religion of his anceftors, makes this affertion; and a fimilar account is given by Lyfimachus, Plutarch, Jultin, Tacitus, and others. The learned Jewifh writer, Jofe. phus, however, treats thefe accounts as altogether fabulous; and flates fome fubflantial arguments in proof of their ablurdity and fallehood. (See Jofeph. Antiq. Judaic. Hib. iii. and contra Apisn, lib. i.) The concurrent tellimony of the hittorians, phyticians, and poets of antiquity, indeed, goes to prove, that the inhabitants of Egypt, for many ages, were fubject to e'cphantiafis, and that, in fact, the dileafe originated on the borders of the Nile; and modern obfervation has afcertained its more recent prevalence in the fame coun. tries. This circumftance feems to have led fome writers to conclude, that the Hebrew leprofy was the elephantiafis, or lepra Arabum, as it has been called. But a conlideration of the fymptness, enumerated by the divine lawgiver, fanctions the conclufion, which the majority of writers have drawn uan the fubject, that it was neither the elephantiafis, in its ordinary trbercular form, on the one hand, nor the fcaly lepra of the Greeks (which, however, it more nearly refembled in its extcrnal appearance) on the other; but that it was the leuce of the Greck writers, the witiligo of Celfus, and the white albaras of Avizenna, and the other Arabian phyficians. (See Lagcee.) See alifo Leon. Fuchfii, Paradps, lib. ii. cap. 16. Greg. Horft. Obf. Med. lib. wii. p. 3.30, Th, Campanellx, Ord. Medic. lib. vi. cap. 23. art. 3 . Forefti, Obf. Chirurg. lib. iv, Obl. 7. Raymond, Hitt. de 'Elephantiafis, p. Uf. Herdler, vom Abendländichers Auflatz, p. 34 t .

It will be fufficient to compare the obfervations of Avicenna, when pointing out the distinction between the ablite alburus and the alguada (morphara of the tranilators), with the marks of difcrimination detailed in the book of Leviticus. refpecting the unclan leprofy, and thofe forms of it which were not deemed unclean, in order to be convinced that the fame difeale is, in both cales, under the wiew of the writer. Avicenna flates that "both fpecies of algusda (viz. alphos and molas of the Greeks) are confined to the flin, and merely fuperficial ; but the albaras affects both the flin and the flesh, even to the bones." Aind again; "there is this difference between the white alquada and the white albaras, that hairs grow upon the tkin afected with the former, and they are of a black or browen colour: but thofe, which grow in the alloras are always rubite; and at the fame time the thin is more deprefled or funk, than the relt of the fur-

## LEPROSY.

Sace of the body. Some depreffion may, perhaps, occur in the suada, but it is very flight. Moreover, a puncture of the fkin with a needte draws blood in the guada; but no blood follows it in the baras, only a watery humidity ; and this is incurable." (Avicennx, Canon. Med. lib. iv. Fen. iii. tract. iii. cap. 9.) In the five or fix (pecies of leprofy defcribed by Mofes, namely, as commencing with a feab or bright fpot, a fwelling, a rawnefs of the flefh, a boil or ulcer, and a burning or inflammation, as well as the leprofy in the head, and that connected with baldnefs, it will be obferved, that the two charafteriftic fymptoms are the whitc$\mathrm{m} / \mathrm{s}$ of the hair, and the depreffion of the flin conjoined, as in the quotation from Avicenna. The whitenefs of the furface alone, without change of colour in the hair, or any depreffion (as it vccurs in the alpbos, morploza, or lepra Gracorum), is exprefsly afferted not to conititute an unclean leprofy. "When a man fhall have in the Gkin of his flefh a rifing, a fcab, or bright fpot, and it be in the fkin of his flefh like the plague of leprofy, then thall he be brought unto Aaron the prielt, or unto one of his fons the prielts; and the prieft fhall look upon the plague in the fkin of the flefl. And if the bair of the plague is turned cobite, and the plague in fight be detper than the jkin of his flefh, it is a plague of leprofy, and the priet thall look upon him and pronounce him unclean." But "if the bright ffot be white in the fkin of his flefh, and in fight be not deeper thals the ikin, and the bair thereof be not turned culite; then the prielt ©hall that him up that hath the plague feven days," in order to afcertain the nature of the difeafe by future infpection. "And the prieft Shall look on him the feventh day; and behold, if the plague in his fight be at a ftay, and the plague fpread not in the fkin, then the priett fhall thut him up feven days more; and the prieft fall look on him again on the feventh day: and behold, if the playue be fomewhat dark, and the plague fpread not in the fkin, the prielt thall pronounce him clean ;" it is but a fab ; and he fhail waith his clothes, and be clean." Leviticus, chap. siii.

Nay it appears that the whitenefs of the fkin, cven when extending over the whole body, was not conlidered as conftituting of i:felf the true leprofy, unlefs fome excoriation, or appearance of "raw hefh," was conjoined with it, or the hair was changed to white, or the depreffion of furface was obferved; and even after excoriation had occurred, if it were fcaled over, or became white, neverthelefs the perfon was declared clean. "A.nd if a leprofy break out abroad in the fkin, and the leprofy cover all the Ikin of him that hath the plague from his head even to his foot, whertfoever the priell lookcth; then the prieft flall confider; and, bèhold, if the leprofy have covered all his fleth, he flall pronounce hin clean that hath the plague: it is all turned rwbite : be is clean. Bat whea raso 在/h appeareth in him, he thall be unclean. And the prielt fhall fee the raw flefh, and pronounce him to be uncleau: for the raw flefh is unclean; it is a leprofy. Or, if the raw heht turn again, and be changed into white, he fiall come unto the prieft, and the prielt fhall fee him: ard, behold, if the plague be turned into white, then the rieft fhail pronounce him clean that hath the plague; he is clean." (Loo. cit.) And, in like manner, when the cutaneous difeafe originates from a "boil," or from a "hot burning," (ilid. vers 18 and 24 ,) in ei her cafe, if, in the place of the boil or burning, there be "a white rifing, or a bright fpot, white, and fomewhat reddilh, and it be fhewed to the prielt ; and if, when the prieft feeth it, behold, it be in fight lower than the fkin, and the hair thercof be turned wobite, the prieft thall pronounce him unclean; it is a plague of leprofy broken out of the boil. But if the prieft look on it, and, behold, there be no whitie
hairs therein, and if it be not lozver than the §kin, but be fomewhat dark ; then the prieft fhall thut him up feven days, Sc. ;" and it," in the mean time, it remains fationary, "it is a bsruing boil, and the prieft fhall pronounce him clean."

And, farther, when the hairy fcalp, or the beard, is affected with leprofy, "if it be in fight deeper than the fking and there be in it a yellow skin hair," the perion is pronounced unclean; "it is a dry fcall, even a leprofy upon the head or beard." But even if there flould be no depreffion of the furface, yet if there be likewife no llack and thick hair, (i. e. hair of the natural appearance,) it is ftill to be confidered as "the plague of the fcall,'" and the perfon is to be thut up for feven days, and to be fhaven, for the purpofe of more accurate inveltigation.

Laftly, when after thefe fucceffive feclufions and examinations, at intervals of feven days, in any of the cafes, the unclean leprofy is confirmed ; then "the leper in whom the plague is, his clothes fhall be rent, and his head bare, and he fhall put a covering upon his upper lip, and Thall cry ' unclean, unclean.' All the days wherein the plague fhall be in him, he flall be defiled; he is unclean: he fhall dwell alone; without the camp fhall his habitation be."

It is to be inferred, from the preceding quotations, that the Hebrews, during their migration from Egypt to the land of Canaan, were fubject to a variety of difeafes of the Ikin and mufcular folids, to which the appellation of leprofy was applied, as a general term ; but that the mot incurable and loathfome fpecies, which was called the leprofy, by way of eminence, was that malady, which has been fubfequently known in the countries which they traverfed and inhabited, and on all the eaftern fhores of the Mediterranean, under the various denominations above ment:3ned, of leuce, vitiligo, albaras alba, and elcphantia alba (Plin. Hitt. Nãt. lib. xxv. cap. 5): That it was not the elephantiafis of Aretæus, in which the face was deformed with tubercles, the lips thickened, the nofe dilated, the ears enlarged and tuberous, and the countenance diftorted, with a reddifh brown complexion tending to black; and ultimately with an ulceration of the rugous and tuberculated parts, (fee ElepiantiaSIS, is obviots from a perufal of the foregoing defcription. The extreme whitexefs, indeed, is mentioned in various parts of feripture, as characteriltic of the leprofy, and is feveral times compared to that of fuow. This colour is the only. circumitance that is flated, in refpect to the miraculors leprofy of the hand in Mofes himfelf, as well as in that of Miriam and Gehazi: (fee Exodus, chap. iv. ver. 6, alfo 2 Kings, chap. vi. v. 27. Numbers, chap. xii. v. 10.); and the bright and fmooth furface and depreffion of the fpots alfo afford a contralt to the prominent and rough tubercles of elephartiafis. Neverthelefs the leuce has fome affinity to the eleplantialis in the lofs of fenfibility in the integuments and mufcles which are affected by it. It would feem, however, to be a legitimate inference from the filence of Mofes, that the tubercular elephantiafis was either ex remely rare, if not altogether unknown to the Hebrews, or that it was not deemed unclean or contagious.
It is fcarcely neceffary to remark to the Englifh reader, that the word flugue, in the preceding paffages, obvioully fignifies only the fpot or difeafe; and implies nothing peltilential or infectious. The word, in the Septuagint, is $\dot{\alpha} \imath^{\prime}$, isus, plaga, (a froke); the latter of which is ufed in the Vulyate
It is by no means clear, indeed, that this form of leprofy was actually contagious, or was even deemed contagious; although fo much care was enjoined by the law in the examination of the fymptoms, and the expulfion of the difeafed from the camp was frictly commanded, in cafe the exiftence

## LEPROSY.

of the true leprofy wore afertained. For in the firft place, so apprehenfion of the communication of the difeafe by infection is any where exprefed; the leprous perfon is faid to be uncleant. But other circumftances, where no contagion or communication of difeafe could be fufpected, were faid, in like manner, to render a perfon traclean ; and the law enjoined, in thefe cafes alfo, a temporary feparation of the perfon from fociety, and fimilar rites, offerings, and ablutions, at the time of being declared clean before the prieft. (Levit. chap. $x v_{0}$.) Thus any iflue or difcharge from the body, the occurrence of the catamenia in women, child-bearing, \&c. all rendered a perfon unclean, and equally fubject to feparation and the fubfequent ceremonies. It would feem, therefore, that the loathfome and foul nature of the difeafe, which infpired this people with a fimilar horror and difguft to that which is felt towards a corpfe (" tanquam nihil à cadavere differentes;" Jofephus Antiq. Judaic. lib. iii. chap. x. fee alfo Numbers, chap. xii. ver. 12.) was the principal reafon for the feverity of the law of exclufion, which was ordained againft lepers. For we are informed by Jofephus himfelf, that, fo far from being fuppofed to be capable of infecting thofe about them with their difeafe, "lepers, in many countries, not only mix in fociety, but are even held in high eltimation ; fo far from being banifhed, or looked upon with. contempt, they are honoured, in warlike expeditions, with military dignities, and with ofices of truft in the adminiltration of public affairs; neither are they excluded from the places of public devotion." (Loc. cit.) The fcriptures, indeed, furnith us with an example of the high ftation of a leper, in the perfon of the Syrian general, Naaman, who was in great favour with his king. And even among the Ifraelites themfelves, it would feem that the exclufion of the leprous was not very rigidly enforced. For we find Gehazi, the fervant of Elifha, fill in the employment of the prophet, and converfing even with the king, after the leprofy had been infleted on him "and his feed for ever:" (fee 2 Kings, chap. v. and vi. and again chap. viii. v. 4.) to (ay nothing of the four lepers fitting at the gate of Samaria, who afterwards returned to communicate the news of the defertion of the Syrian camp. (Ibid. chap. vii.) And in after times the leprous had free accefs to Chrit, and joined in the crowds that followed him. (St. Matthew, chap. viii.) They were alfo inhabitants of the towns and villages; for Jefus was "in the boufe of Simon the leper, in Bethany." lbid. chap. xxvi. v. 6.
Thefe fact c , then, afford more than prefumptive evidence, that the Hebrew leprofy, the leuce, or vitiligo alba, was not a contagious difeafe, any more than the white fcaly leprofy, -which is common in our own time. And there is much reafon for believing, that even the tuberculated leprofy, or elephantiafis, was equally void of contagious qualities, as we fhall prefently ftate, notwithflanding the ftrong affertions to the contrary among the ancients, We have already obferved, however, that the latter was confidered as a confe. quence of the white leprofy in many inftances, or as the fame difeafe, in a more fevere degree; for the lepra was faid to change into elephantialis (Galen. de Tremor. proter Nat. cap. 13.) : and this author alfo mentions two cafes, in which, on the contrary, elephantiafis was changed into lepra by a particular mode of treatment. Galen, de Simplic. Med. Fac. lib. xi.
Little can be faid, that fhall poffefs any intereft, refpecting the treatment of the'leuce, or Jewifh leprofy. It was generally deemed an incurable difeafe in ancient times, and is almolt uaknown, we believe, at prefent in Europe. It ftill, perhaps, appears occafionally in Iceland, and other northern regioss, as a precurfor, or as a modification of the
clephantiafis, according to the obfersation of a late intelligent traveller in the inalid juft mentioned. He Itates, that he faw a woman anfected with a horrible difeafe, which is there called Likthrau, $\mathrm{b}_{\mathrm{f}}$ which her face was fo corroded a4 to prefent a moft difguting fpectacle. "Her legs and hands," he adds, "were fwollen to an comonous lize, thefe later being alfo covered with a thick and almoff wublite fkin lying in oreat surinkles." (Hooker's Journal of a Tour in Iceland, F. 186.) The thickened and rugous fkin, with the ulcerations of the face, belong to elephantialis; whi'e the morbid cubitenefs is characteriftic of leuce. Mr. Hooker alfo expreffes his opinion, that this difeafe was not contagious. No light has been thrown upon this difeafe by a ftill later traveller in the fame ifland, who has recounted the fymptoms of elephantiafis, as commonly given in books, and apparently added nothing from perfonal obfervation. (See Mr. Holland's Paper on the Difeafes of Iceland, in the fir G. Mackenzie's "Tour" in that ifland, jult publifhed. Dec. 1810. ) Profeffor Henfler mentions a cale, which he once faw for a few minutes, and which appears to have refembled that mentioned by Mr. Hooker. "The whole countenance was puffed up; the cuticle was of a dirty white, or whitifh-grey colour, dry and fhrivelled; but foft to the touch, as if difterded with a watery fluid; with fiffures here and there, from which fome exudation took place." The cuticle alfo exhibited fome furfuraceous and powdery exfoliations. Henfler remarks, that the comparifon (applied by Aaron to his fifter Miriam, in Numbers, chap. xii. v. 12.) of fuch a perfon to a dead and macerated fatus, is a moft happy illultration of the appearance. ("Let her not be as one dead, of whom the flefh is half confumed, when he cometh out of his mother's womb.') The phyfician who attended the patient, feen but once by Henfler, compared the appearance of the ikin to that of thick, fliff, dried leather; it was fo thick, that an experienced furgeon made feveral atrempts to open a vein, without fuccels, in various parts of the body. There was great fwelling, ftifneefs, and tention of the eyelids, with a frequent ophthalmia, and great fenfibility to light. A thick and foetid cruft covered the fcalp. She was twice fo nearly cleared of the leprofy, fo as to go out of doors again; the firft time by large dofes of conium with fublimate of mercury; the fecond, by tincture of cantharides, after antimonials and mercurials had increafed the fymptoms. A third time fhe was improving much, under the ufe of fmall dofes of arfenic, which, however, was neceflarily omitted, and fhe ultimately died. (Henfler vorn Abendiz̈ndifchen Auffatz $3^{\text {er }}$ Abfchnitt. § 11. P. 351.) It is worthy of remark, that the leprofy, in this cafe, fufpended a pulmonary confumption, the fymptoms of which never afterwards returned.
Of the caufes of this form of leprofy, we fhall fay nothing, until we come to treat of the leprofy of the middle ages.
With refpect to the leprefy of horfes and of clothes, men. tioned in the Mofaic code, it is probable that the expreffion was merely analogical, the fpots and difcolourations which appeared upon the walls and articles of apparel being looked upon as refembling the leprous fpots : while, at the fame time, as they were molt probably the confequence of humidity, the appearance of them might either actually accompany, or precede and prognofticate, difeafes in the inhabitants of the houfes and wearers of the garments. (Levit. chap. xiii. and xiv.) It is no where faid that the difeefe, called leprofy, is capable of being communicated to the inhabitants or wearers, in thefe cafes; but that it is unclean. The garments were ordered to be burnt, and the flones to be taken away, and replaced by others, or the houfe ultimately
to be defroyed, whem; after cettain infecoions by the prief, the greenith or reddin fpots in them continued.

Lerrosy of the middle ages. The hitory of Europe, from the fixth to the ifteenth century, is fearcely lefs full of the defcriptions of the phylical dititrefles of the people, occafioned by famine, pellilence, and difeafes of the mot loathFome and fatal hind, than of the political and moral evils which befet them. Among the maladies of thofe times, leprofy, uides all the forms to which the term has been applied, appears to have exilted fo generally and uncealingly, as to have claimed a more univerfal attention than even the -plague itfelf. It was one of the firt fubjects, on which the active benerolence of the early Chrillians exerted itfelf, and thtimately it abforhed a very large propertion of the wealth of Chritendo:n, which was apprupriated by the donations of the pions to the maintenance and relief of thofe who were afficted with it. Thefe immenfe charitios, however, were at length adminitered under great abufes, and afford no accurate grounds upon which to calculate the extent of the prevalence of the maiady.

In inveftigating the hiftory of the difeare in the middle arpes, we fhall probably find it fufficiently clear that the elephantiafis, or tuhercular difeafe, (the Lepra of the tranilators of the Arabians, ) was the principal form againlt which the precautionary laws were framed; but that almolt all cutaneous difeafes were popularly confidered as of a leprous nature; that, in fact, many miltakes were committed, And many wilful deceptions practifed, by which other dileafes were confounded with elephantialis; and that its difappearance from Europe is probably the refult of the amelturation of the moral and plyyfical condition of fociety, which the progrefs of civilization and fcience has brought about.

The general opinion, which was prevalent among the Greeks and Romans, that leprous difeafes originated in Egypt, is in fome meafure confirmed by the particular confideration given to them in the firtt hintory of man; and the more copious and dittinet defcripion of thefe dileafes, fubdequently given by the Arabian phylicians, as well as the accounts piblithed by travellers in, more ricent times, (fee thofe of Prolper, Alpinus, Tournefurt, Niebuhr, Bruce, \&c.) who witneffed their frequent occurrence in that and the neighbouring countries, have led to a common belief, that the infeqtion was brought into Europe, in the eleventh century, by the armies that returned from the crufade. But independently of the doubts, which may be entertained, in refpect to the contarious nature of elephantiafis and leuce, there is fufficient evidence recorded, efpecially among the tranfactions of the faints, in proof of the prevalence of leprofy in the welt, at a much earlier period. Lepers are mentioned in many public asts, according to Muratori (Antiquit. Ital. Med. Ævi. t. ii. difl. 16.), in the fixth century; and Gregory of Tours fpeaks of a place, where .thefe unfortunate perfons were accuitomed to walh themfelves, as well as of a hofpital appropriated for them. Gre--gory the Great, in the fanie century, likewife alitdes to the fubject, and particularly mentions one leper, "quem dealis vulneribus morbus elephantinus defedaverat." In the following century, Rhotaris, king of the Lombard, publihed an edict agrainit lepers, by which they were conlidered as dead in the bav, and enjomed not to come near to found perfons, but to apprife them of their approach, by making a noife with a w, oden chapper. There was a river near Alli, in Lombardy, ta:nous in thofe times for the cure of leprofy; whence, in the eighth century, the Lombards were confidered as a filthy leprous people : aud the wife pope Sylvelter, upon the plea of leprofy, difiuaded the king of

France from marrying a Lombard princels. So early as the eighth century, St. Othmar, in Germany, and St. Nicholas de Corbie, in France, inflituted leprous houfes, which had been already numeroufly eftablithed in Italy. King Pepin, in 757, and Charles the Great, in 789 , iffiued ordinances, by which the marriages of lepers were diffolved, and their alfeciation with the healthy prohibited. In the life of St. Athanafius, in the ninth century, lepers are alfo mentioned; and indeed, in general, the acts of the faints, compiled by the Boilandifts, are replete with examples of the malady, thronghout Europe, in the middle ages ; even in the life of St. Antonimus, fo early as the fourth century, a cafe of leprofy, "horrendiffima elephantix lepra," is mentioned. Muratori, loc. cit. : alfo Raymond, Hiftoire de l'Elephantiafis, p. 107: Henfler, über den Auflatz, p. 211.

Thefe facts imply the general prevalence of leprofy in Europe, long antecedent to the Crufades. It is clear, however, that many fevere difeafes afflicted Europe to a much greater extent, and with augmented virulence, about the period when thofe fanatical expeditions were executed, or rather from the tentl to the fixteenth centuries, than before; and, among the reft, the leprofy appears to have been every where prevalent. Every country abounded with its hofpitals, eftablifhed for the exclufive relief of lepers, although the number, of thefe inftitutions has been probably exaggerated. Several authors have, by an error in tranflation, quoted Matthew Paris (Hift. Angl, ad annum 1244) for an affertion, that nineteen thoufand lazarettos exilted in Chriftendom; but that author only flates, that the horpitalers were, at that period, poffeffed of 19,000 manors. "Habent bofpitalarii novem decim millia maneriorum in Chrittianitate." Ir is affirmeć, however, that Lews VIII., king of France, made bequefts, in the year 1227, to two thoufand legrofories within his own kingdom. (Raymond, loc. cit. 106. Collect. des Hitt. de France. Du Cange, Glofs. voc Lazari.) In this country, there were a great number of thefe eftablifluments. It is affirmed, that the city of Norwich alone contained five. (Sprengel, Gefchichte ii. Theil, P. 498; who quotes Hutchinfon, in the Polit. Mag. for Feb. 1789 , p. 93.) The mott extenfive inflitution of this kind was in Leicefterfhire, at a place thence called Burton-Lazars; it was founded in the reign of king Stephen, and dedicated to the Virgin and St. Lazarus, and became poffeffed of immenfe riches; fo that all the inferior lazar-houfes in England were in fome meafure fubject to the mafter of it, as he himifelf was to the mafter of the l:zars at Jerufalem. (See Nichols's Hift. of Leicefterfhire.) In London there were fix, according to Becket, the largelt of which was that of St. Giles, without Temple Bar.

Mureover, the general exilitence of leprous difeafes is farther evinced by the creation of an order of knighthood, which fprung from the fingular combination of military ardour with a zeal for the religion of peace, fo prevalent in thofe times. In the parable of the rich man and the poor man covered with ulcers, recorded in the New Teftament, the latter was mentioned by the name of Lazarus; whence the devout difpofition of the times invented a St . Lazarus, whofe name was given to the order of knighthond, and who was deemed the tutelary faint of the leper-houfes, and of each individual leper. So far, indeed, did the miltaken piety of the age extend, that not only was every man, who returned from Paleftine affected with foul fores, deemed a faint, Lazarus; but was particularly recommended to the devout, as one under the fpecial punifiment of Gad, for the benefit of his foul. Wherefore pious perfons of the lighelt rank believed that they could bring themfelves no greater

## LEPROST.

favour in the ejes of the Deity, than by their attention to thefe holy fuffercrs, by wafhing, kiffing, and even licking their wounds. Not only priefts and archbihops, but even kings are recorded to dave performed this naufeous piety at certain feafons. King Robert of France, and Louis IX., have been particularly mentioned as practifing thefe ceremonies. (Du Cange. yoc. Lazari. Joinville Hitt. de St. Louis. Sprengel, Gefchichte, ii. 4S9, \&cc.) 'The knights of St. Lazarus had the double duty affigned them of holy warriors and attendants upon lepers; and the lazarettos were placed generally under their controul. Lepers, indeed, were admitted into the order, and the mafter of it was alfo required to be a leprous knight. (Moëhfen de Medicis equeltri dignitate ornatis, p. 56. quoted by Henfler.) The immenfe wealth, which they accumulated, became at length, however, a temptation to the rapacity of fome fovereigns; and Philip V., efpecially, accufed all the hofpitallers in France of high treafon, by confpiring with the Turks and Jews, feized their property, and ordered them to be burnt. Sprengel, loc. cit. Mezeray Hift. de France, ii. p. 7 I.

We may obferve, by the way, that the application of the name of Lazarus to every thing relating to leprofy, affords another proof of the very vague manner in which the fubject has been generally confidered. For not only was the difeafe of Lazarus not termed leprofy by the divine fpeaker of the parable; but the fatement that his body was "covered with fores," neither reprefents the picture of the Jewifh leprofy, nor of the elephantiafis, nor yet of the lepra of the Greeks. (See a learned diff. by Fred. Hoffman, "De Morbo Lazari," in his works, Supplem. tom. iii. p. 553 .

In all the towns, where lazarettos were eftablifhed, medical ufficers were appointed by the police, to examine all perfons, who were fuppofed to be affected with leprofy, previous to their feclufion in thofe receptacles; indeed, where no fuch eftablifhments exitted, huts were erected a little way out of the towns (where alfo the hofpitals were generally placed) for each individual leper. The rules and edicts, with regard to the conduct of the lepers, were, as far as the circumitances admitted of it, nearly copied from the Mofaic laws. It is obvious, however, from the writings of thofe phyficians, who held the office of examiners after the revival of learning, and indeed it was avowed by them, that the tubercular leprofy, or elephantialis, was the difeafe, to the detection of which their inquiries were particularly directed. The earlielt writers, who appeared in the dawn of modern learning, (and feveral of whom added original obfervation to what they borrowed from Avicenna, and the other Arabians, ) defcribed the elephantiafis under the appellation of lepra. (See the works of Guid. de Cauliaco; Gul. de Saliceto, and the Compendium Medicina of our learned and able countryman; Gilbertus, who lived about the reign of Edward I., and has left a defcrip. tion of leprofy, fo full and minute, as to evince a confiderable fhare of perfonal obfervation, notwithlianding the charge of plagiarifm from the monk, Theodorick, which Dr. Friend enforces againft him.) Greg. Horlt, who was one of the appointed examiners at Ulm, in Bavaria, at the end of the fixteenth century, has left us the particulars of the examination, ufually practifed by himfelf and his collearues, when fummoned by the magifirates for that purpofe. After the preliminary queitions relative- to the age and family of the perfon brought before them, they examined him refpecting the exiftence of the difeafe in his parents and progenitors; his habits of life and his allociates, with a view to the probability of contagios; his peculiar temperament, and previous ftate of health, and particularly as to the fup-
preffion of cuflomary evacuations; and then as to the climate, foil, habitation, and diet, to which he had previoufly been accuftomed. They then queltioned him, feriatim, as to the ftate of all the functions, mental and corporeal : ard lattly, denudatis partibus omnibus, they examined the whole body, with a view to afcertain the prefence or abtence of the following external fymptoms. Firlt they infpected the head, to fee whether the lair was begimning to fall off; whethe: that of the beard was becoming fofter and thinner; and that of the eye-brows and eycelafhes was difappearing ; and whether, when the hairs were pulled up by the roots, a part of the fkin was brought away with them; whether the eyes were round and grim, the ears acuminated, the lips thick, the nofe tumefied externally, the nofrils, internally ftuffed and ulcerated, the face unequally fivelled with tubercles, and of a livid red hue? Whether the veins under the tongue were enlarged with tubercles, as if varicofe? . Whether the fkin was unctuous, fo that water ran off it, or there were under it tubercles nearly without fenfibility, efpecially behind the ears, and on the extremities? Whether the fkin was rough, like that of an unfeathered goofe, or affected with horrid fiffures, and ruge, refembling the hide of an clephant, or covered with warts, like the grandines of fwine, or affected with morphsa, impetigo, or a dry and incurable fcabies? Whether there were any nodes about the joints? Whether the mufcles of the extremities, efpecially about the thumbs, were emaciated? Whether the naiis were incurvated? Whether the fkin was fenfible to the puncture of the furgeon's needle? Whether there were offenfive ulcers, with a bad habit of body, efpecially ulcerations and fiffures in the fingers and toes? and whether the voice was hoarfe and obtufe ? They then drew fome blood, for the purpofe of examining it. "Thefe fymptoms being prefent," fays the author, " we deem the difeafe elephantialis, and decree that the patient, inafmuch as he is affected with an incurable and contagious leprofy, is to be feparated from all communion with the healthy." Gregor. Horttii Obf. Med. lib. viio Obf. xviii. Epilt. J. H. Hoptnero.

It is obvious, however, from the acknowledgment of Horlt himfelf, as well as from the concurring oblervations of feveral phyficians before his time, that the elephantiafis was by no means the only difeafe of the kind admitted into the lazarettos. He goes on to obferre, that where the tubercles of the face, the thick lips, acuminated ears, flattened nofe, round eyes, (the efficutial fymptoms of elephantialis,) are abient ; yet where the patients are affected only with a dry and foul fcabies, with puttular eruptions, tiffures, and branny exfoliations, which conltitute the fora of the Greeks ; or even with great itching, emaciation, ulceration, and exfoliations of thicker fcales, affecting alfo the head and face, which are the lepra of the Greeks; neverthelefs they are fent to the lazarettos, if they are poor, for the means of fubfiftence. "Hence it happens," he adds, "that here, and elfewhere, very fers inftances of real elephantiafis are found in the lazarettos, whillt many are there, affected only with an obltinate pfora or lepra Gracorum."' We have alfo the dire $E$ t teltimony of an able obferver, Van Foreeft, (better known by his Latin appellation, Forellus,) who practifed at Alcmaer and Delft, in the middle of the fixteenth century, and who has alio left an account of the mode of examination of lepers, duopted by himfelf, that a very fmall proportion of the pcrfons, who wandered about the Low Countries, as lepers and beggars, were true lepers; but were merely affecteil wath icabies, or fome external defredation of the fkin. "Nay," he fays, " not one in ten of them is truly a leper, or afflicted with the legitimate elephantiafis." And he adds the authority of a phylician at the Hague, who had,

## LEPROSY.

with him, lamented the careleftaefs or ignorance of the public examiner at Harlem, לy whom a great number, (quem plurimi,) who were the fubjects of fome ordinary cutancous eruption, were declared leprous. (See Forelti, Obferv. Chirurg. lib. iv. Obf. vii. Schol.) But, above all, Riedlin, who was phyfician to the leper-houfe at Augfourg, affirms that, out of fifty-nine cafes, he faw but one which was elephantiafis, and that in a flight degree; all the reft were inftances of the pfora and lepra of the Grecks. (See Shroeck, Mifc. Anu: 1689, p. 61 , and Henfler, loc. cit.) It is probable, moreover, that in addition to all the ordinary cutaneous difeafes, which were thus denominated leprofy, the fcurvy itfelf (we mean the true foorbutus, which was formerly fo well known in our fleets, and which appears to have been not unfrequent in the middle ages, during periods of fcarcity and famine) was confounded with the fame difeafe. This idea was thrown out by Hoffmann. "Quando mecum perpendo hodierni veri fcorbuti fymptomata, vix mihi temperare poffum, quin, iis cum adflictionibus elephantiacorum collatis, fcorbutum leviorem elephantiafeos effe fpeciem afferam; at inde miram morborum pro diverfâ regionum ac aeris conftitutione mutatione confiderem. Sed tranfeat hæc conjectura, digna qux penitius inveftigetur." (De Morbo Lazari, § vo) Prof. Sprengel alfo fufpects that thofe forms of leprofy, which have been called mal de la rofa in Afturia, and pellagra in Lombardy, were fcorbutic (Gefchichte der Arzneykund, ii. 486.) : and many analogies between the two difeafes are pointed out by Raymond. Hift. de l'Elephant. p. II8, et feq.

Thefe leprous complaints began to decline in number and violence, in Italy, about the end of the fifteenth century, and in France and Europe, in general, in the fixteenth. In the middle of the fifteenth century, indeed, the tubercular difeafe, elephantiafis, was almolt unknown in Italy. For Ant. Beniveni, who died very old at the beginning of the fixteenth, obferves, that he once faw at Florence a ftranger affected withelephantiafis; a difeafe, he fays, almoft never feen (in his time) in Italy, and almof unknown to phyficians. At the beginning of the fixteenth century, Alex. Benedetti and Joh. de Vego omit the tubercular leprofy from the lif of difeafes, mentioniag it only curforily, and not from experience; but the latter fpeaks fully of morphea, impetigo, baras, alopecia, mal morto, and other difeafes that have been claffed with leprofy. (Henfler, loc. cit.) About the middle of the fixteenth century, Irancis I. ordered the number of lepers in each lazaretto, or maladrèrie, to be reported, and after appropriating a fuficient fum for their fupport, ordered the remainder of their revenues to be given to the grand almoner, for general ufe. In the feventeenth century, leper-houfes were itill continued, (though fimilar meadures had been generally adopted fince the decline of the difeate throughout Europe, ) and were greatly abufed by the admiffion of beggars, and idle vagrants of all defcriptions, who employed every fpecies of trick to imitate leprofy, or to produce appearances of cutaneous difeafe. The elephantiafis itfelf, however, ftill occafionally appeared, of which feveral recorded cafes are referred to by Henner. Some writers, indeed, have fuppofed, that the changes, which took place from the clofe of the fifteenth century downwards, were rather changes of names than an actual difappearance or diminution of leprofy ; and that the veneral difeafe, which was firft noticed at that period, was in fact the leprofy with a new appellation. Indeed, fome authors actually denominated the morbus Gallicus, or fyphilis, a leprofy; as Campanella, who treats of it among other leprous difeafes, under the title of lepra Gallica. (See his 3Ted. Pradict. lib. vi. cap. 23.) But although the fecondary
fymptoms of fyphilis might be millaken for leprofy, or called leprous, in common with other ulcerations and cutaneous affections, in a confiderable number of inftances, and for fome time; yet, as the learned and able Aftruc, after Leonicenus and others, has thewn, there were fo many points of obvious and decided difference, in the fymptoms and proo grefs of the two difeafes, as rendered fuch a confufion to any great extent improbable. (See Aftruc. de Morb. Vener. vol. i. lib. i.) Neverthelefs, when we reflect upon the unvarying adherence to ancient authority, which characterized the profeffion for centuries after the revival of learning; and when we confider, that the mealles and fmall-pox, for infance, were deemed the fame difeafe, including alfo farlet fever, fo late as the time of Diemerbroeck (Fce his Tractat. de Variolis et Morbillis, cap. 13.) ; we fhall readily conceive, how flow the early phyficians would be in acknowledging a new difeafe, which had not been mentioned by the Arabians, and with what facility they might confound it with the old, under a denomination fo vaguely interpreted, as that of leprofy.
At all events, we are entitled to infer, from the preceding view of the fubject, that, during the middle ages, moft erroneous notions prevailed refpecting the leprofy: and that the terrors of the ancients, refpecting the contagions and unclean nature of leuce and elephantiafis, were transferied almoft indifcriminately to every chronic cutaneous difeafe, whether fcaly, fcabby, puftular, or ulcerous, contagious or non-contagious, which then occurred. And as we are now well acquainted with the latter claffes of difeafe, (although, from caufes to be mentioned immediately, they may be much lefs frequent than formerly), as we know that all the forms of fcaly difeafe, fuch as the modifications of lepra, pforiafis, ichthyofis, and pityriafis, to ufe Dr. Wil. lan's nomenclature, as well as the running tetters, or impe. tigines, the veficular eruptions, herpes, miliaria, and pompholyx, and the lichenes, prurigo, \&c. among the papulousaffections, are all void of any infectious quality; we mult be fatisfied, on the one hand, how miflaken was the charity, which erected thoufands of hofpitals, and appropriated immenfe treafures, for the maintenance of thofe who. were affected by thefe diforders, and for the fancied fecurity of the healthy; while, on the other, we fee the cruelty and abfurdity of the regulations and ceremonies, which were inftituted in regard to fuch patients, iomewhat after the manner of thofe enjoined in the thirteenth chapter of Leviticus, for the Jewifh lepers. In fact, a perfon affected with the real or fuppofed leprofy, was treated like a dead body: funeral obfequies were performed, and maffes faid for the benefit of his foul. The whole is thus defcribed by a French writer.
" A prieft, clothed in a furplice and ftole, repaired with the crofs to the leper, who was prepared for the ceremony. The holy minifter began by exhorting him to bear patiently, and in a fpirit of refignation and penitence, the incurable affliction with which God had ftricken him; he then befprinkled the fufferer with holy water, and conducted him to the church. Here the leper put off his ordinary clothes ; and, having put on a black habit prepared for the purpofe, fell on his knees before the altar, between two treftles, and heard mafs; after which he was again fprinkled with holy water. This ceremony, it will be remarked, differed very little from that which is ufually performed at funerals. While the leper was conducted to the church, the fame verfes were fung as at burials, and after the mafs, which was allo the fame as that which was performed for the dead, the Libera was fung, and the leper was then conducted to the houfe deftined for him. When he had arrived, the prieft again exhorted and
confoled him, and threw a fhovel-ful of earth on his feet. The hut (where there was nolazaretto) was fmall, and was furnifhed with a bed and bedding, a veffel for water, a chett, a table, a chair, a lamp, a towel, and other neceffaries. He was prefented with a cowl, two fhirts, a tunic, and a robe called bouffe, a little cafk, a funnel, a rattle (des eliquettes), a knife, a ftick, and a girdle of copper.
"Before the prieft quitted him, he interdicted him from appearing in public without his leper's habit and naked feet; from going into churches, mills, or where bread was cooking; from wafhing his hands and clothes, \&c. in the wells and brooks; from touching any commodities that he defired to purchafe at market, except with a ftick, in order to point out the article wanted; and from entering houfes, or taverns, for the purpofe of purchafing wine, as he had only the privilege of remaining at the door, of alking for what he required, and receiving it in his little cank. He was farther enjoined not to draw water, but with a proper velfel; never to reply to the queitions of any one who met him on the road, unlefs he was to leezward, in order that the inquirer might not be infected by his breath, and the contagious odour exhaling from his body; never to place himfelf in narrow roads; never to touch children, nor to give them any thing which he had touched; never to appear in public meetings; and never to eat or drink with any but lepers. In fhort, thefe wretched people were regarded as dead among the living : their children were not baptized at the fonts; and the water employed at their baptifm was thrown into lonely places. When a leper was fick, the prieft adminittered the facrament to him, and extreme unction; and when he died he was buried in his hovel, or in the place of interment appropriated for the leprous." See Ogée, Abregé de l'Hitt. de Bretagne, prefixed to the Dietion. de Bretagne.
In mof places thefe miferable outcafts were allowed to enter the towns, near which their hovels or lazarettos flood, at certain times of the year, efpecially about Eafter and Chrittmas. The following law exitted at Mareilles. "Prefenti conflitutione firmamus deinceps obfervandum, quod nulli Leprofi feu Mezelli, divites vel pauperes, poffint vel debeant ftare infra Maffiliam, nec converfari deinceps, nifi tantum per xv dies ante pafcha, et per viii dies ante Natale Domini, \&c." (Stat. Maffil. lib. v. cap. 15.) When they walked, or came into a town, they made a noife with their rattles, to warn paffengers of their prefence. In fhort, their fituation was truly melancholy. The ties of marriage were diffolved, where one of the parties only was affected; but they were allowed to marry when they could find a leprous companion. They were, indeed, allowed the ufufruct of property ; but they could neither transfer nor inherit it: they were deemed to have fuffered a civil death, and to be "hors de la loi mondaine" See Henfler, loc. cit. § 4. Sprengel, loc. cit. p. 49r-2. Raymond, p. 112.
Yet not only were thefe laws executed againft multitudes who were affected with cutaneous difeafes, neither properly leprous nor contagious; but it is even very queitionable whether the true tubercular elephantiafis itfelf, any more than the lefs formidable baras alla, or leuce, were actually contagious. We have already ftated the reafons which tend to difprove the infectious nature of the latter. (See Leprosy of the Jezus.) The evidence againft the probability of contagion, in the cafe of elephantiafis, refts partly upon the facts, which are cafually mentioned, in more ancient times; and partly upon thofe which have been more carefully and correctly afcertained nearer to our own. The obfervations of Aretæus, which have been echoed by almoft

Vol. XX.
all fucceeding writers, are given with an appearance of terror, excited rather by an acquiefcence in the popular belief, than from any actual knowledge of the fact. When we defcend to the early ages of Chrittianity, we find thefe terrors perpetuated by the laws refpecting lepers, which were at once the effect and the caufe of a continuation of the popular opinions; but at the fame time, we find kings and bihops mixing familiarly and frequently with thefe very objects of legal profcription, and condefcending to offices which ra quire the clofeft contact with their perfons, not only without any expreffions of apprchenfion, but without any one recorded inttance of the difeafe being fo communicated : we find, too, that fora term of feveral days, during certain fafts and feltivals, thefe infected people are actually allowed to mix in the towns; facts which fland in direct contradiction to the traditienal prejudices and laws upon the fubject.

Defcending, ftill farther, to the period when learning and obfervation had again enlightened the minds of men, we find thefe very prejudices and laws extending equally to a numerous tribe of cutaneous diforders which we know are not contagious, as to the elephantiafis; an error which muft render the accuracy of the opinion, as to the contagious quality of the latter, exceedingly queftionable. At the fame time we difcover the contention between obfervation and pre-conceived opinion in the minds of the learned, which almofts breaks forth in the admiffion of the truth. Thus Fernel, who adopted the common notion of its contagious quality, admits, neverthelefs, that from all the obfervations he has been able to make, he has never difcovered a cafe which proved its exiftence (De Morb. Occult. lib. i. cap. xii.) ; and Foreftus, Fabricius, Plater, \& c . who ftill held the popular opinion, expreffing their aftonifhment at feeing the daily commerce between the leprous and healthy, even in married perfons, without any communication of the difeafe; fo that they are compelled to afcribe its origin to certain qualities of the air and the diet.

When we come to the evidence of our own times, we have ftill more convincing teftimony of the nop-contagious nature of the tubercular leprofy. Dr. Thomas Heberden, ftill retaining fomewhat of the prejudices of education, when fpeaking of the cales of the difeafe which he faw at Madeira, fays, "Notwithftanding the juft abhorrence which every one entertains of this loathfome difeafe, it certainly is not fo contagious as is commonly imagined;" and then he relates his obfervations, which prove that it is not at all contagious. "For I have niever beard of any one," he adds, " who has contracted the diftemper by contact of a leper; and, on the contrary, I not only am a daily ruitnefs of communication between lepers and other people, without the leaft ill confequences, but know feveral inftances where a leprous hufband, married to a found wife, has cohabited with her for a long feries of years, and had feveral children by her, without her having contracted the leaft fymptom of the dif. order, although the children have inherited it; and vice verfá between a leprous wife and found hufband. ${ }^{20}$ (See Med. Tranf. of the Coll. of Phyf. vol. i. p. 32.) Still more recently, Dr. Adams has inveftigated the nature of elephantiafis, in the fame inland, where there is ftill a lazaretto, near Funchal; and his obfervations not only confirm thofe of Dr. Heberden, as to the non-contagious nature of the difeafe; but they alfo fhew that other miftakes, which originated probably in the terrors of the imagination, when the difeafe had acquired the appellation of Satyriafis (from the acuminated ears, flattened nofe, and rugous front); namely, that fo far from being poffeffed with a libido inexplebilis, the pro-creative appetite and power are gradually deftroyed, if the difeafe arife in the age of manhood, and

## L. EPROSY.

never developed if it commence before that of puberty. See Adams on. Morbid Poifons, 2d edit. chap. IS.

It is true, that about the middle of the 18 th century, Dr. Hillary hasd deferibed the elephantiafis as occurring in the Weft Indies, with all the characteriftics attributed to it by the ancients. But the defcription of that lcarned phySician is but too obvioully a tranfeript of the account given by Aretrens, uncorrected by his perfonal obfervation. (Sce his Obf. on the Dif. of Barbadocs.) In this the learned writer affords but one example, among a long feries of medical fcholars, in whom authority but too often dimmed the eye of obfervation, or diftorted its views.
If the leprofy of the middle ayges, then, were not contagious, whence did it originate and frecad fo widely ? Probably the hint thrown out by loreltus, Plater, and others, and more fully developed in the excellent treatife of-Raymond, already often quoted, may afford an adequate explanation of the fact ; to wit, that the uncultivated and marthy condition of the foil ; the confequent humid and miafmatous condition of the atmofphere; the falt, putrid, indigeltible aliment, and the frequent fcarcity even of that which the phyfical and political diforders of the times produced; the infalubrious condition of the towns and habitations, both in refpect to bad fituation, want of cleanlinefs, and other pernicious circumftances; in fhort, thefe combined evils, which appear to have exilled in thofe times and countries where the leprous, among other frequent and diltreffing maladies, prevailed, were, in all probablity, the fources from which thefe cacheetic difeafes fprung.

It has been fatisfactorily fhewn, from a review of the domeftic hiftory of the times, in which frequent and fatal epidemics have raged, how much thefe were connected with the circumfances juit enumerated (fee Epidemic, and Health) ; and it is interefing to trace the diminution, and ultimately the total difappearances of thefe peftilences, in proportion to the amelioration of thofe phyfical and moral evils; and to difcover, that while the happinefs and comforts of man are extended by the advancement of civilization, the wort difeafes that harafs and fhorten life are at the fame time nearly extinguifhed. (See the excellent Obf. on the Increafe and Decreafe of different Difeafes, by Dr. Heberden; alfo, Ann. Med. Regifter and Review.) If we turn from the febrile plagues to the more chronic maladies which are the fubject of the prefent article, we find that they hive generally gone hand in hand. (See Scurvy, It:ys Sacer, Ergot, Sce.) The hiftory of the fourry, in particular, affords an analogical ilfuftration of the influence of the circumftances alluded to, in producing many of the loathfome fymptoms enumerated amnng thofe of leprofy; efpecially the defædations of the fkin, the fivellings of the limbs, the ulcerations, fungous excrefcences, fectid difcharges, gangrenes, and lofs of joints and limbs;-appearances as hideous as any of thofe afcribed to leprofy. Now, this difeafe has been banifhed from our fleets within the lalt half century, fol ly by the fubatitution of whole ome and digeftible aliment, and by the adoption of vemtilation and internal cleanlinefs; it has, in like manner, been fubdurd in Germany, and thofe parts of the north of Europe, where it prevailed fatally in the tiwe of the Rumans, in proportion as agriculture and the arts have changed the face of that once marthy and uncultivared region, and obtained a regular fupply of nutritious and wholefome food.

If our fpace would admit of a review of the phyfical and politia circurnflances of the times, in which leprous difeafes have been fo extenfively prevalent, it would be eafy to adduce ample proof that, from the begrinning of hiltory, thefe madadies leve occurred under fuch ftates of fociety;
and that they have commonly vifited, almolt exclufively. thofe clafles of fociety who were moll expofed to the influence of thofe circumftances; namely the poor. Lower Egypt has, from the earlieft antiquity, been fubject to thefe difeafes, and from the extenlive inundations occafioned by the overflowing of the Nile, can never be rendered a dry or falubrinus country. The ancient hiflorians concur in their defcriptions of its heavy and milty atmofphere, furcharged with vapours. (Strabo, lib. xvii.) The inhabitants ate a glutinous fort of bread made of the roots of the lotus, \&c. ; and ufed much fifm in every flate; and having few trees, they had no wholefome fruits to conjoin with their diet. But how much more imperfectly the Hebrews were nowrifhed in their long march through the wilderneflist of Arabia is obvious, and indeed recorded; to which all the infalubrions circumflances of a camp were added. Perliaps no combination of circumftances could be conceived more favourable, as well to the production of frequent peltilences, as to the excitement of thofe cachectic ftates of the body, in which foorbutic and leprous affections originate, than the foil and marfhes of an uncultivated land, the fordes and miafmata of an immenfe encampment, frequent fcarcity of provifions, fatiguc, and univerfal public anxiety and diffatisfaction, for the quelling of which the great leader had recourfe to fupernatural means.

It appears from the account of Prolper Alpinus, a profeffor of Pavia, who vifited Egypt late in the fixteenth century, that both the lepra and elephantiafis of the Grecks were common among the poor at that period; and he attributes them to the caufes above-mentioned. "They are compelled through poverty," he fays, "t to drink muddy: and femiputrid water; they eat the fleh of camels and becf, and fifh falted and half putrid, caught in the marfhes and lakes; but they principally live upon a fort of cheefe, immoderately falted and femiputrid, which is fold at a very low price:" (De Medicina Aegyptior. lib. i. cap, xiv.)-a diet very much refembling that formerly ufed on flip board in long voyages; when, as we have been informed, the falted provilion, which had been fometimes two years in cafk, emitted an almoft intolerable ftench during its maceration, before being cooked.

Without attempting to trace the progrefs of leprous difeafes, in comection with the phyfical and political derangements in various countries, (a fatisfactory fletch of which the reader will find in Raymond's treatife,) we fhall merely exemplify this view of the fubject by a fight notice of the ftate of Europe in the middle ages, when leprofy and peitilence of every fpecies prevailed. From the fifth century, when the empire at length fell under the repeated affaults of the northern invaders to the tenth, the finelt parts of Europe lay in a ftate of devaftation, little cultivation was prac+tifed, all the arts were neglected or loft, and clothing, habitations, and food were alike infufficient and unwholefome = and for three centuries more this dcfolation was increafed, if poffible, by the inceffant wars that were waged. There were fourteen plagues in the fourteenth century, with intervals of but fix years between each; and frequent famines. The food confifted, even in England at a later period, of much falted provifion, efpecially in the winter, and of a hard and black bread, chiefly of rye, to the fcarcity of whicl corn, rather than to its ergoted or difeafed condition, the ignis facer, malades ardens, and other fimilar maladies, fhould doubtlefs be attributed. So little were vegetables cultivated, indeed, or gardening underfood, even in the fixreent'. century in this country, that, in the year 1509; queen Catharise could not procure a fallad, till Henry fent to the Netherlands, and engaged a gardener to come over to

## L. E P

raife the proper articles here. (Northonck's Hill. of Lond book. i. chap. 7.) How totally deftitute of fuch diet mur the people in general have been at a much later period! Sce Heazth of London.
In fhort, in whatever country an uncultivated foil, a marfhy funface, and a humid atmofphere have been found, together with a diet generally confilting of a falted, femiputrid, infufficient, or indigctible aliment, and compofed chiefly of animal flefh or fifh, with a fmall proportion of nutritious vegetable matter; there, from the carlieft times, luman life has been fhortened by the multiplication of peftilential fevers and cachexies of a leprous and fcorbutic nature. Therefore, as Raymond obferves, even if the ecclefialtical writers of the middle ages had left us no records of the hiitory of fuch maladies; the hiftory of the foil, of the circumiltances of the times, and of the food generally ufed, would afford an inconteltible monument of the exiftence of leprofy.

Of the cure, or of the attempts to remedy a difeafe which was generally admitted to be incurable, it would be futile to enter into any detail. The treatment of thefe forms of cutaneous difeafe, which were claffed with the elephantiafis, will of courfe be deferibed under their refpective heads.

LEPSIA, in Ancient Geography, an ifland in the fea of Rhodes, near the coalt of Caria. Pliny.
LEPSINA, in Geography, a town of European Turkey, in Livadia, anciently called "Elcufis" of which confiderable ruins remain; 12 miles N.W. of Athens. See Elevesinia.

LEPSIS, in the Greek Mufic, is a name given to one of the rules of the ancient melopocia, called alfo fanetimes, euthia; by which the compofer difcerns in which of the three fyftems of founds he fhould place his melody:-in the grave part of the fcale, called bypatoides; the acute, called netoides, or the mean, called mefoides. See Melopceia and Usus.

LEPSTI, in Geography, a town of European Turkey, in the province of Macedonia, in the gulf of Saloniki; 12 miles S. of Jenitza.

LEPTA, in Botany, fo called from $\lambda$ emios, flender, or minute, from the remarkable diminutivenefs of its flowers. Loureir. Cochinch. v. 1. 82,-Clafs and order, Tetrandria Monogynia. Nat. Ord. Hederacea, Linn. Vites, Juff.
Gen. Ch. Cal. Perianth inferior, fpreading, fmall, divided into four ovate fegments. Cor. Petals four, fomewhat triangular, furrowed, inflexed, twice as long as the calyx. Stam. Filaments four, awl-fhaped, inflexed, inferted into the receptacle at the angle of the bafe of the petals; anthers ovate, two-celled. Pijf. Germen fuperior, roundifh, four-furrowed; ftyle fcarcely any ; figma obtufe. Peric. Berry four-lobed, lobes ovate, flightly confluent towards the centre, fingle-feeded. Seeds roundifh.

Eff. Ch. Calyx four-cleft, inferior. Corolla of four triangular petals. Berry four-lobed, four-celled, each cell containing a fecd.

1. L. triphylla. Loureir. Cochinch. A native of woods in Cochinchina, and called by the natives Cay Mat.-This trce is about ten feet high, and exceedingly branched. Leaves ternate, lanceolate, entire, wąved, fmooth. Flowers white, very fmall, in compound, fmall, axillary clufters.

We are acquainted with this plant from Loureiro's account only, which approaches fo nearly to many different things, that we dare not offer any conjecture refpecting it. The habit of this genus very much refembles that of Ciffus, but the character of its fruit appears to be effentially different.

LEPTADENIA, from $\lambda$ etios, flender or fbarp, and ainnv, ditvos, a gland, expreffive of the contracted acute termination of the maffes of pollen, which makes a very peculiar
part of the gencric charakter. Brown Afclep. 23. Mem. of the Wernerian Soc. v. 1. 34-Clafs and order, Pentandria Digynia. Nat. Ord. Contorte, Limn. Apocinte, Julf. Afclepiadce, Brown.

Eff. Ch. Corolla fornewhat whecl-flaped; tube fhort; orifice crowned with tive feales, Handing between the fegments; limb bearded. Crown of the flamen 3 wanting. Antliers uncomuected, fimpic at the top. Maffes of pollen crect, attached by their bafe, contracted and pellucid at the fummit. Stigma pointlefs. Follicles . . . . .
Mr. Brown has examined three Species, reducible to this genus, in the Bankfian herbarium, none of which are yet defcribed, nor has he named or defined them feecifically. One was gathered by Forfkall. They are all natives either of the Lalt Indies, or of Africa. They appear to be perennial, herbaceous, climbing plants, clothed with a greyith, impalpable, powdery down. Leares flut, oppofite. Umbels between the footflalks, fometimes cymofe. Stigma minute.

## leptanthus. See Heterantiera.

LEPTASPIS, from $\lambda s$-itios, finder, and asmb, a field, a genus of graffes, feparated from Pharus by Mr. Erown in his Prodr. Nov. Holl. v. 1. 211 , on account of the peculiar ovate concave outer valve of the corolla; but its habit and inforefcence are fo like P/barus lalifolia, that the author himfe!f candidly expreffes his doubts of the propricty of this meafure. One fpecies was found by fir Jofeph Banks in the tropical part of New Holland; another comes from the Molucca ines.

## Leptaurea. See Zoegia.

LEPTIS:Magna, in Ancient Grograpby, a town of Africa, on the fea-ccaft, in the Syrtic region, at the S.E. extremity of that which was particularly denominated Tripolis; not far to the E. of the river Cinyphis. It was allo called Neapolis. Leptis was a Roman colony, and in procefs of time became epifcopal. See Lempta.
Leptis Paria, Lempta, a town of Africa, on the feacoaft, S.E. of Adrymetum, about a mile in compafs. Some ruins of the ancient town remain. Sec Lempta.

LEP'TOCARPUS, in Botany, from $\lambda$ srios, flender or Tharp, and $火 x_{\text {pros }}$, fruit, the minute feed or nut being pointed with the permanent bafe of the Ityle. Brown. Prodr. Nove Holl. v. 1. 250.-Clafs and order, Diocia Triandria. Nat. Ord. Tripetaloidea, Linn. Junci, Juff. Refiacee, Brown.

Gen. Ch. Male, Cal. of feveral coriaceous, keeled fcales, either fafciculated or imbricated, each one or two-flowered. Cor. Petals fix, membranous; the three inner ones thinner and narrower. Stam. Filaments three, flattifh; anthers fimple, peltate.

Female, on a feparate plant, Cal. and Cor. as in the male. Pif. Germen fuperior, roundilh; ftyle folitary, thread-fhaped; Itigmas two or three, oblong, downy, acute. Peric. Nut fmall, roundifl, not burfting, tipped with the bafe of the ftyle, with one cell and one kernel.

Eff. Ch. Male, Calyx-fcales cluftered or imbricated. Petals fix. Anthers fimple, peltate.

Female, Cal. and Cor. as in the male. Style one. Stigmas two or three. Nut cruftaceous, fingle-feeded, crowned with the bafe of the ftyle.
A genus of hard rufhy plants, of nearly the fame defeription as Lepidofperma; fee the conclufion of that article; but more akin to the Limmean Refio, from which it differs in having a fimple fingle-fceded nut, inftead of a capfule with two or three cells and as many valves. The ftems are generally quite fimple, leaflefs, but clothed with theaths Iplit at one fide. Flowers cither in tufts, or in fpike-like catkins. Mr. Brown thinks thofe which come under the
firft defcription may hereafter be feparated from the latter. Examples of Leptocarpus, are Refio difachyos of Rottboll's Icones 8. t. 3. f. 5, and Schoenodum tena.x of Labillardiere, Nov. Holl. v. i. t. 229, the female plant.-Seven feecies are defined as natives of New Holland, and there are fuppofed to be feveral at the Cape of Good Hope, befides the above Refio, and $R$. imbricatus of Thunberg.

LEP'TOCEPHALUS, in Ichebyology. Sce Morris.
LEPTODECARHOMBIS, a name given by Dr. Hill to fome prifmatic varieties of felenite. Sec Gypsums.

LEPTOMERIA, in Botany, named by Mr. R. Brown
 a portion or Bare. Brown Prodr. Nov. Holl, v. 1.353 .Clafs and order, Pentandria Monogynia. Nat. Ord. Calycifora, Linn. Elaagni, Juff. Santalaces, Brown.

Gen. Ch. Cal. Perianth fuperior, of one leaf, in four or five deep, widely fpreading, permanent fegments, internally coloured. Cor. Petals none. Nectary glandular, crowning the germen, in four or five lobes. Stam. Filaments four or five, awl-fhaped, fhorter than the calyx, inferted into the bafe of each fegment; anthers roundifh. Piff. Germen inferior, ovate; ftyle very flort ; ftigma depreffed, of from two to five rays. Peric. Drupa ovate, more or lefs juicy, crowned with the calyx. Seed folitary.

Ef. Ch. Calyx of one leaf, wheel-fhaped, fuperior, bearing the ftamens. Nectary glandular, crowning the germen, four or five-lobed. Stigma divided. Drupa of one feed.

Eight fpecies are defined by Mr. Brown, as natives of New Holland. They are flender branched fhrubs, with fcattered minute leaves, or none at all. Flowers minute, white, reddifh or green; generally fpiked, with a fmall deciduous brallea to each; fometimes axillary, without bracteas. The genus is akin to thofe fpecies of Theffum which grow at the Cape of Good Hope, but differs in its glandular neetary, which is either of one piece, lobed, crowning the germen, or compofed of glands, each of which ftands at the bafe of ore of the fegments of the calyx. Three of the fpecies have a ftarry five-rayed acute ftigma, and fivecleft, fpiked, bracteated flowers; among which is L. Billardicri, (Thefium drupaceum; Labill. Nov. Holl. v. I. 68. t. 93.) from Van Diemen's land, a flender much-branched fhrub, fix feet high. One, L. acerba, found at Port Jackfon, has a two-lobed obtufe ftigma, four-cleft flowers, and no leaves. The remaining four have a drier drupa, a notched blunt ftigma, and five-cleft flowers, and all grow on the fouth coaft of New Holland.

LEPTOS Libanotis, in the Materia Medica of the Ancients, a name given by forre of the Groek writers to the fmall frankinconfe, that is, fuch as came to their hands in fmall flakes, broken from the larger maffes in the gathering or packing up. This was alfo called manna thuris, the manna of frankincenfe. the word manna being of old ufed to exprefs any thing formed of granules, or fmall pieces. The ancients eftcemed this lepros libanotis, or manna thuris, when pure, bevond any other kind, for they always valued that frankincenfe molt, which was drielt and molt brittle; and fuch only as was fo, could break off iu thefe fmail flakes. The medicine, however, foon became fubject to adulteration, and lolt its credit; for the dult of the frankincenfe bei.g allowed to be put up among this manna thuris, Diofcorides tells us, that in his time people, greedy of gain, had found the way to adulterate it, by adding, inflead of this genuine dult, the fifted powder of the refin of the pinetree. Sce Frankincense.

LEPTOSPERMUM, in Botany, fo named by Forfter, from $\lambda e \pi i o s$, finuler, and $\sigma \pi \epsilon \mu \mu$, feed, becaufe the numerous
feeds are remarkably fmall and flender. Forl. Gen. 36. t. 36. f. f-l. Smith Tr. of Linn. Soc, v. 3. 260. Willd. Sp. Pl. v. 2. $94^{8 .}$ Ait. Hort. Kew. ed. 2. v. 3. 181. Juff. 323. Lamarck. Dict. v. 3. 465. Illuftr. t. 423 . Gærtn. t. 35-Clafs and order, lcofandria Monogynia. Nat. Ord. Hefperidea, Linn. Myrti, Juff.
Gen. Ch. Cal. Perianth half-fuperior, in five deep, ovate-oblong, or roundifl, often coloured fegments. Cor. Petals five, with claws, roundifh, equal, twice the fize of the calyx, and much longer than the ftamens. Stam. Filaments numerous, inferted into the calyx, awl-fhaped, incurved, fhorter than the corolla; anthers fmall, roundif, two-lobed. Pijf. Germen half-inferior, turbinate ; ftyle fimple, columnar, erect, about the length of the ftamens; ftigma capitate, umbilicated, undivided. Peric. Capfule roundihh, coated in the lower part, of three, four, or five cells, and as many valves, burfting at the upper part, the partitions from the middle of each valve, oppofite to each calyx-tooth. Seeds numerous, linear, fomewhat angular, tapering at each end, very fmall, inferted into the central column.

Eff. Ch. Calyx five-cleft, half-fuperior. Petals five, longer than the flamens, furnifhed with claws. Stigma capitate. Capfule of three to five cells. Seeds angular.

Obf. L. ambiguum only has the ftamens longer than the corolla,
This genus of New Holland fhrubs was confounded by Dr. Solander with Pbiladelphus, and by Gxrtner, Forter, and others with Metrofideros and Melaleuca. The former is diftinguifhed from it by having the flyle deeply four-cleft, with limple fligmas, the petals broad at the bafe and feffile, leaves oppofite and deciduous, and the habit indeed altogether unlike; Metrofideros differs in its fimple ftigma, extremely long thread-ffhaped ftamens, and more dilated habit, in which characters Melaleuca accords with the latter, with a few exceptions as to habit in the foliage of fome fpecies, but differs from it and from Leptoffermum in the polyadelphous ftamens.-The fpecies of the genus before us are rigid, branched fhrubs, of rather humble, fometimes proftrate, growth, aromatic when bruifed; their leaves alternate, fmall, entire, evergreen ; fowers numerous, ufually folitary, white, often with a purple tinge about their organs of impregnation. The following are all at prefent known to us.

1. L. fcoparium. New Zeeland Tea, or common Southfea Myrtle. Andr. Repof. I. 622. (L. fquarrofum; Gæertn. v. I. I74.t.35. Melaleuca fcoparia; Linn. Suppl, 343. Fort. Prodr. 37. Pl. Efc. 78. Schrad. Sert. Hannov. 25. t. 15. Philadelphus fcoparius; Soland. in Ait. Hort. Kew. ed. I. v. 2. 156. Tea plant; Cook's Second Voyage, v. 1. 100. t. 22.) - Leaves ovate, fharp; pointed, obfcurely three-ribbed. Calyx fmooth; its teeth nembranous and coloured.- Native of the coalt of New Zeeland, where it was difcovered by fir Jofeph Banks and Dr. Solander, and was thought by captain Cook to have been very ferviceable to the health of his crew. Its infufion or tea is pleafantly aromatic and fragrant; if not fuffered to fland too long, in which cafe it becomes bitter. Mixed with an equal quantity of the New Zeeland Spruce, (fee Dacrydiom, ) it was found to make excellent and highly palatable beer, of the molt falutary qualities, the Dacrgdium being too aftringent alone. This plant, raifed at Kew from feed in ${ }_{1772}$, is eafily kept in our green-houfes, and is covered in fummer with elegant white blofoms, whofe calyxteeth, ftamens and fyle are purplifh. In New Zeeland it becomes a fmall tree. The liaves are numerous, fcattered, ever-green, fmall nearly feffile, entire, fharp-pointed, rigid,
fmooth,
invoth, dotted, paler beneath, more or lefs ovate, but varying extremely in length and breadth, fo that the two varieties indicated by authors are by no means diftinctly marked, and the gardeners make many more, which are 'equally evanefcent. The capfule is hard and woody, permanent on the old branclies long after the feeds are difperfed, $3 s$ in moft New Holland plants of this family.
2. L. flavefcns. Yellowifh South-fea Myrtle. Sm. Tr. of Linn. Soc. v. 3. 262 . Willd. n. 3. Brown in Ait. Hort. Kew. ed. 2. n. 2. (L. Thea; Willd. n. 2. Melaleuca Thea; Schrad. Sert. Hannov. 24. t. 14.)-Leavcs linear-lanceolate, obtufe, without lateral ribs. Calyx fmooth; its teeth membranous, coloured, naked. Native of New South Wales. It was procured from thence for Kew garden, by fir Jof. Banks, about 1787 . The branches are longer, and more Alexible, than in the former; leaves narrower, longer, almof linear, inclining to elliptic, and pointlefs: Petals whire, often with a purple tinge, turning yellowifh in drying. The talys-deth are coloured, that is, whitifh, not green; which Willdenow, in copying the character, has omitted, and this caufed the fame omiffion in Hort. Kew.
3. L. attenuatum. Fine-branched South-fea Myrtle. Sm. n. 3. Willd. n. 4.-Leaves linear, flightly lanceolate, acute, three-ribbed. Calyx clothed with filky hairs; its teeth membranous, coloured, nearly naked. - Native of New South Wales, fent to Kew by fir Jof. Banks in 1795. Its nender habit, and narrow acute leaves diftinguifh this from both the former. The flozvers moreover are imaller, often two together, their flalks. germen, and bafe of the calyx clothed with filvery, filky, rather fpreading hairs. Petals and calyx-teeth white. It bloffoms from May to July.
4. L. grandifolium. Large-leaved South-fea Myrtle. Sm. Tr. of Linn. Soc. v. 6. 299.-Leaves lanceolate, fharp-pointed, obfcurely five-ribbed, downy beneath. Calyx hairy; its teeth membranous and coloured.-Sent from Port Jackfon, New South Wales, in 1795, by Dr. White to Mr. Lambert. It is larger than any of the foregoing in all its parts; the leaves above an inch long, and near a quarter of an inch broad, lanceolate inclining to obovate, with a fmall prominent fharp point; Chining and fmooth above, except when young; paler, opaque, dotted, downy, and marked with two flight lateral ribs, on each fide the principal one, beneath. Flowers large, white and handfome, feffile and folitary at the ends of the fhort lateral leafy branches. The back of their caly $x$-teeth, as well as the germen, is covered with long, white, fhaggy hairs.
5. L. trinerve. Silky South-fea Myrtle. (L. lanigerum; Willd. Sp. Plo n. 50 Melaleuca? trinervia; White's Voyage, 229. t. 24 .) -Leaves lanceolate inclining to obovate, three-ribbed. Calyx filky; its teeth leafy, perma-nent.-Native of New South Wales; Dr. White. This has much the habit of the laft, but is in all its parts only about half the fize. The leaves vary in breadth, and are more or lefs obovate. The germen, with the calyx and its teeth, are entirely clothed externally with beautiful, clofepreffed, filky or filvery hairs. Peials white.
6. L. lanigerum. Hoary South-fea Myrtle. Brown in Ait. Hort. Kew. ed. 2. n. 4. Sm. Tr. of Linn. Soc, v. 3 263. (Philadelphus laniger: Ait. Hort. Kew. ed. I. v. 2. 156.) - Leaves oblong or obovate, obfcurely three-ribbed, fomewhat hairy. Calyx clothed with long fhaggy hairs. -Native of Van Diemen's land, and of New South Wales. In the Tranf, of the Linn. Soc. this was confounded with the laft, but Mr. Brown has corrected that miftake. The prefent fpecies has the germen and whole calyx remarkably hoary with long fpreading hairs, not filky with clofe or erect
ones. The leaves when young are more or lefs hairy, and the young branches downy. The fcales of the flowering buds appear alfo to be larger and more permanent, imbricated, elliptical, and externally hairy.
7. L. parvifolium. Small-leaved South-fea Myrtle. Sm. Tr. of Linn. Soc. v. 3.263. Ait. Hort. Kew. ed. 2. n. 5. -Leaves obovate, imbricated, riblefs. Young branches and calyx clothed with fpreading hairs; teeth membranous, coloured, naked. --Sent to us from New South Wales by Dr. White in 1795. It is faid to have been communicated to Kew garden by fir. Jof. Banks in 1789. The leaves are not a quarter of an inch long, numerous, imbricated, either obovate or exactly elliptical, blunt, flat, thickih, withont any rib, dotted, fmooth, on fhort pale fmooth flalks. Flowers terminal, folitary, fmall, white. Germen and bafe of the calyx clothed with fpreading hairs, but the teeth are naked, roundifh and coloured. The younger branches are rough with coarfe, long, fpreading hairs.
8. L. imbricatum. Imbricated South-fea Myrtle. Sm. Tr. of Linn. Soc. v. 6. 3.0.-Leaves obovate, imtricated, riblefs. Branches and calyx fmooth; teeth membranous, coloured, naked, keeled - Gathered at Port Jackfon, New South Wales, by Mr. David Burton, and communicated to us by fir Jof. Banks in 1797. It greatly refembles the laft, but the copious little leaves are ftill more ftrikingly im. bricated, efpecially on the long lateral branches, which moreover are imooth, as well as every other part. The flowers are extremely fmall, ftanding two or three together about the end of each branch; their germen and caly.x perfectly naked; the teeth of the latter fharply keeled, which in L. parvifolium are only a little convex.
9. L. aracbnoideum. Cobweb-flowered South-fea Myrtle. Sm. Tr. of Linn. Soc. v. 3. 263. Gærtn. จ. 1. 174- t. 35. f. 3-Leaves awl-fhaped, fharp pointed. Branches hairy. Germen and calyx entirely clothed with long fpreading hairs. - Native of New South Wales. The fem is flout, apparently of humble growth, with numerous, fhort, zigzag, leafy, hairy, lateral, compound branches. Leaves crowded, awl-fhaped, fharp-pointed, fmooth, dark-green, about half an inch long, chanrelled above, convex beneath, refembling fome flonder kind of juniper. Flowers fmall, folitary, terminating the fhort fubdivifions of the branches, and remarkable for the very long and fine white fpreading hairs, like a \{pider's web, which clothe the germen and whole calyx. It is a ftranger to our gardens.
10. L. juniperinum. Juniper-leaved South-fea Myrtle. Sm. Tr. of Linn. Soc. v. 3. 263. Venten. Malmaif. t. S9. -Leaves lincar-lanceolate, fharp-pointed. Young bratiches filky. Calyx fmonth; its teeth membranous, coloured, naked. - Native of New South Wales. Mr. Fairbairn raifed it in Chelfca garden about the year 1790. This is an upright buify $/ b r u b$, whofe young branches are ciothed with filky hairs. The leaves are larger, and ftill more like juniper, than thofe of the preceding; Gilky when young. Flowers numerous, white, folitary at the ends of the very fhort, lateral, axilary, leafy thoots. Germen depreffed, fmooth as well as the caly, and its teeth, which are broad and coloured.
II. L. trilocilare. Three-celled South-fea Myrtle, Venten. Malmaif. t. 88, - Leaves linear-lanceolate, fharp-pointed. Calyx filky ; its teeth coloured, minutely fringed. Stamens fifteen. Capfule of three cells.-Native of New Holland, We know it only by the plate and defcription in M. Ventenat's fuperb Jardin de la Malmaifon. The habit and foliage are much like the laft. Branches downy and reddilh. Germen rather more elongated, clothed with fhort filky down, as are alfo the calyx-teeth, which are fringed, and

## L E P

coloured of a purplint red. Pctals white. Stamens but fifteen, and cells of the frait only three.
12. L. baccatum. Pulpy-fruited South-fea Myrtle. Sm. Tr. of Limn. Soc. v. $3 .{ }^{264 .}$ (L. juniperifolium; Cavan. Ic. v. 4. 18. t. 33 I. f. 2.)-Leaves linear-lanceolate, flarppointed. Bracteas fmooth. Germen and caly $x$-tecth downy. Capfule with a pulpy coat. - Native of New South Wales, fent to Kew garden by fir Jof. Banks in 1790 . A low depreffed rigid thrub, with the habit and foliage of our Englifh dwarf variety of the juniper. Flowers much like fome of thofe laft defcribed, but their germen and whole caljs $x$ with its teeth are clothed with white cottony, rather than filky, hairs. The germen is clofely enveloped in fmooth, fomewhat fringed, concave braleas, which, being taken for the germen itfelf, caufed an error in the original defcription of this fpecies ; but indeed that part becomes fmooth as it ripens into fruit, as well as very thick and pulpy. The petals are yellowith in the dried plant, but probably white when recent, like L. flavefcens. Cavanilles's fynonym feems rightly applied in Hort. Kew. though he defcribes the caly.x as fmooth. The fruit in our plant, as well as his, has five ceils.
13. I. ambigurm. Hook-leaved South-fea Myrtle. Sm Tr. of Linn. Soc. v. 3. 264 . Exot. Bot. v. 1. 115 . t. $5^{\circ}$ (Metrofideros corifolia; Venten. Malmaif. t. 46.) -Leaves linear-lanceolate, recurved at the point. Calyx nearly fmooth; its teeth leafy, lanceolate, naked. Stamens longer than the corolla. - Native of Ncw South Wales, fent to Kew garden by fir Jof. Banks in 1791. It Forms a handfome buhky evergreen fhrub, bloffoming plentifully in the green-houfe in fummer. The branches are downy. Leaves numerous, crowded, dark-green, channelled, dotted, bluntifh, recurved at the tip, often roughifi. Flowers white, with very numerous fpreading famens, that are peculiar in this genus as being longer than the corolla, yet not near fo long as in Metrofideros, and the capitate figma ftamps our plant a Leptofocrmum, which the habit altogether confirms. Ventenat defcribes the germen as of three cells ouly; we find four or five, fo that this character appears variable.
14. L. virgatum. Wand-like South-fea Myrtle. Fortt. Gen. 36. Wiilld. n. 12. (Melaleuca virgata; Linn. Suppl343. Forf. Prodr. 37.)-Leaves oppofite, linear-oblong, bluntifh. Stalks axillary, three-flowered.-Gathered by Forter in New Caledonia. As Willdenow has admitted this into Leptofpermum, we would not leave it out, notwithflanding the reatons given in Tr. of Lian. Soc. v. 3.265 , which ftrongly induce us to think it a decandrous Beckea. The flamens are ten. Leaves oppofite, whereas in every certain Leptofpermum they are alternate. The umbellate flowerfalks too are not natural in this genus.
${ }^{15}$ L. pubefens. Downy Twifted South-fea Myrtle. Willd. n. ह. See Tr. of Linn. Soc. v. 3.263.-Leaves elliptic-obovate, downy, twifted, with a fmall recurved point. Germen and calyx-teeth downy--Native of New Holland, conmon in gardens. We fubjoin this as a fpecies taken up by Willdenow from the Linn. Tranf. but whofe limits we have not yet fully determined. It does however feem diftinct enough from laniger and trinerve, as well as from all the reft. Much more light is to be expected relative to all the fpecies of this genus from the fequel of Mr. Brown's Prodromus, and we therefore leave thefe two laft fpecies for future determination, efpecially as the pubefcens is not received into the fecond edition of Hort. Kew.-For fimilar reafons we leave unnoticed the three fpecies figured in Cavanilles, to 330 and 33I, which moft probably are reterable to fome of the above; but his plates and defcriptions are infufficient to de-
termine which, and would therefore fill be ufelefs, if by any means determined.
 a Spike of flowers, elegantly applied by Mitchell to the Phryma of Linnxus, and retained by the latter as the fpecific name. See Phryma.

LEPTOS'IOMUM, from $\lambda$ anin, fender or narrozv, and sq $\mu x$, the mouth, expreflive of the narrow orifice of the capfule. Brown. Tr. of Linn. Soc. v. IO. 320.-Clafs and order, Cryptogamia Mufci. Nat. Ord. Mujci.

Eff. Ch. Capfule oblong, without furrows, terminal. Lid hemifpherical, without a beak. Fringe a fimp?e, flat, annular, undivided membrane, from the inner coat.

All the four known feecies of this genus are natives of the fouthern hemifphere. They are moffes of a denfely tufted mode of growth, with upright, branched, perennial ftems. Leaves moderately fpreading in every direction, broadifh, entire. revolute, with a ftrong midrib, and a terminal hair, which is fufpected by Mr. Brown to be fumetimes branched. Fruit-Atalk terminal. Capfule either erect or drooping; tapering at the bafe into an inverfely conical apophyfis; much contracted at the mouth. Veil fmouth and naked, deciduous.

1. L. inclinans. Tr. of Linn. Soc. v. 10. 320. t. 23. f. 2.-Leaves obovate, obtufe. Capfule drooping, obovate-oblong.-Found by Mr. Brown in Van Diemen's land, upon rocks and Itones at the eaft fide of Table Mcuntain, near the fummit, in 4.3 fouth latitude, and from 3000 to 3500 feet perpendicular above the fea. This mofs is two or three inches high. Slems but little branched, leafy in the upper part, denfely clothed with rulty down below. Leaves rather concave, very minutely dotted or reticulated, tipped with a twilted hair $\frac{1}{4}$ th the length of each leaf. Fruit-falk brown, fmooth. Sheath at the bafe accompanied below by numerous abortive pirtils and capitlary, jointed, fucculent threads.
2. L. ereflum. Leaves oblong-parabolic, obtufe. Capr fules oblong, ereet - Found by Mr. Brown on the eaft coalt of New Holland, in a mountan:ous part of the country, growing on rocks near the banks of the rivers Hawkefbury and Grofe. Stems about as tall as the former, fimple or branched, clothed with rufty down in their lower part, leafy above. Leaves crowded, a little incurved and clofe-preffed by drying, each tipped with a firple hair. Fruit-falk elongated, brown, fmooth. Capfule itraight. The lid had fallen off.
3. L. gracile. Leaves ovate-oblong, rather pointed; terminal hair half their length. Capfule oblong, flrajght, drooping. - Gathered by Mr. Archibald liserzies, at.Dufky bay in New Zeeland. The fems are denfely tufted, fomewhat branched, about an inch high, thickly clothed with rufty down in their lower part. Leaves yellowihh-green, dotted, clofe-preffed when dry, pellucid, ftrongly revolute, with a very thick rib, and a fmooth terminal hair. Fruibfalk near two inches high, flender, tawny, with a fheath at the bottom, the fumniit very flender and drooping. Capfule nearly pendulous, a quarter of an inch long, flender, ftraight, nightly fwelling in the middle, of a dark opaque brown. Lid very fmall, obtufe, of a till deeper brown.
4. L. Menziefit. Leaves oblong-lanceolate, acute; terminal hair a quarter their length. Capfule cylindrical, drooping, recurved.-Difcovered by Mr. Menzies at Statenland in ${ }^{7} 887$. We, as well as Mr. Brown, are indebted to him for fine fpecimens of this and the lait. The flens of L. Menziefii are half an inch or more in height, mokly fimple, with denfe rufty fibres and roots. Leedrees bright yellowih-green, crowded, finely dotted, wavy and clofe-

## L E P

preffed when dry, with a flortifh terminal hair. Fruit-falk about an inch high, folitary, crect. Capfule light brown, fmooth, one-third of an inch long, drooping, cylindrical, fingularly recurved, with fomewhat of a turgid appearance. Liid very fmall; after it is fallen the white, membranous, very delicate friuge becomes dittinctly vifible.

Mr. Brown with good reafon fufpects Bryum macrocarpum of Hedwig, Crypt. v. 3. t. ro, may belong to this genus. If $f o$, there is an error in the delincation of its fringe; and it will prove the only known fpecies whofe leaves are tipped with a branched hair.

LEPTUM, in Antiguity, a fmall piece of money, which, according to fome, was only the cighth part of an obolus; but others will have it to be a filver or brafs drachm.

LEPTURA, in Entomology, a genus of Coleoptera: the antemx are fetaccous; palpi four, and fliform; wing-cafes tapering towards the tip; thorax flender and rounded. Thofe of the Linnæan lepture which have the lip entire, conftitute the genus Donacia of Fabricius; and fuch as have the lip bifid form a part of the lepture of that author ; for the latter do not exclufively confitt of thofe infects which, according to the Limnæan character, belong to leptura; leptura abbreviata of Fabricius, for example, is necydalis major of Linneus, and leptura variegata, the Gmelinian nerydalis variegata. Moft of the leptura tribe are furnihed with legs of pretty confiderable length ; run with much fpeed' and activity; and are found on flowers.

## Species.

Aquatica. Golden; poferior thighs clavated and den. tated. Fabr. Leptura aquatica, Linn. Leptura aquatica Jpinofa, Degeer. Donov. Brit. Inf. Donacia dentata, Hoppe.

The colour of this Ipecies varies from reddifh, or braffy, to green; the antennx blackin, with pale teltaceous at the joints; head with a line down the middle; thorax grooved ; body beneath downy; legs obfcure, teftaceous. Common in Britain, and other parts of Europe, on aquatic plants, particularly the nymphra.

Simplex. Golden; thighs fimple. Fabr.
An European fpecies, perhaps leptura aquatica mutica of 1 Degeer.

Fasciata. Golden; wing-cafes with a purple longitudinal band. Herbit. Leptura aquatica fafciata. Degecr.

Inhabits watery places in Europe. The thighs fometimes armed with teeth.

Micans. Pofterior legs bidentated; flanks fimple; wing-cafes gloffy-violet. Hoppe.
Allied to L. aquatica, and inhabits the fame places.
Holosericea. Shining.green; antennæ and legs fufcous, black; pofterior thighs dentated. Herbit.
An European fpecies, found in damp fields, \&c.
Palustris. Blackif-violet; antennæ and legs chefnut; pofterior thishs dentated. Herbft.

A native of Pomerania; found in marhes.
Cinerea. Cinereous, fpeckled with coppery. Herbf.
Inhabits with the former.
Marginatus. Pofterior thighs one-toothed; wingcafes golden ; margin and fpot at the bafe rufous; abdomen and legs filvery. Hoppe.

On aquatic plants in Germany.
Nymphefi. Potterior thighs dentated; thorax and wing-cafes coppery; body cinerecus, downy. Fabr.

Native of Europe, on the leaves of the nymplira alba. The head is coppery; antcunz and mouth black; body beneath filvery-brown.

Sagitiariz. Poiterior thighs one-toothed; wing-cafes

## I. E P

green-golden, minutely punctured and truncated ; abdomen and legs golden. Hoppe.

Antennx blackifh; thorax wrinkled and furrowed.
Viol,Acea. Deep black, and fomewhat brafly; wingcafes obfcure, violet ; abdomen fanguineous. Pallas.

Size of leptura aquatica, and inhabits Siberia.
AEsa. Pofterior thigh armed with one tonth; wingcafes brafly, equal, rounded; abdomen and leges brafly. Hoppe. Lefpirticanca, Lime.

Native of Europe.
Brcolok. Golden; thorax above, with the wing-cafes, green, the latter with ftriee of impreffed dots ; polterior thighs dentated. Linn. Muf. Lefk.

An European fpecies.
Fusca. Polterior thighs with a fingle tooth; body brown; wing-cafes itriated and punctured; mouth, anteonx, and legs rufous. Limn.

Inhabits with the former.
Crassipes. Pofterior thighs umarmed; body greenbronzed, beneath cinereous, brafly ; wing-cafes itriated with punctures, and marked with tranfverfe fmall lines; mouth, antemme, and legs rufous. Linn.

Native of Europe.
Rufescens. Polterior thighs dentated; body reddifh. bronze; beneath cinereous-bronze ; wing.cafes itriated, punctured with crenated wrinkles. Lim.
Inhabits Germany and Sweden.
Nitida. Pofterior thighs toothed; body Mining-green gold; wing-cafes ftriated and punctured, with crenated wrinkles, and a broad, common, purple-green fillet; abdomen, antennæ, and legs gold. Linn.

Native of Europe.
Cerulea. Pofterior thighs dentated; body blue; wing-cafes friated, punctured with crenated wrinkles; antennx braffy. Linn.

Inhabits Europe.
Clavipes. Pofterior thighs unarmed; body: bralfy; abdomen covered with filvery down. Fabr.

Native of Germany, on aquatic plants.
Fasciculata. Body black ; polterior legs long; thighs unarmed; the fhanks with a tuft of long feathers.. Fabr.

Inhabits Cayenne; the body very flender, with a filvery glofs beneath.

Linearis. Pofterior thighs unarmed; wing-cafes linear, truncated, fhining-braffy; legs fomewhat teltaceous. Hoppe. A fpecies found in Europe; antenne blackifl; abdomen cinereous.

Hydrocharis. Pofterior thighs unarmed; wing-cafes cinereous, gloffy, rounded at the end; body and legs cinereous. Hoppe.
Native of Germany ; the antennre cincreous.
Mucronata. Pofterior thighs unarmed; body above livid ; beneath, head, and antennæ black; thorax with two divergent lines; wing-cafes fpinous at the end. Hoppe.

Vulginis, Potterior thighs unarmed; body filverygreen; wing-cafes flriated and punctured, with crenate wrinkles, and a broad, common, purple-green fillet; head, abdomen, and legs filvery-afh.
**: Lip biful.

Unipunctata, Black; wing-cafes rufous, with a black dot in the middle. Fabr.
Inhabits about Drefden.
Hastata. Deep hlack; wing-cafes red; tip and future in the middic black. Fabr. Stenocorus niger, E̛c. Geoffr.

Native of the fouthern parts of Europe. Segments of the abdomen with filvery down at the edge.

Bipunctata. Black, villous; wing-cafes livid, with a black dot in the middle. Fabr.

Inhabits Siberia.
Tomentosa, Thorax villous and golden; wing teftaceous, with the tip black. Geoff.

Head and antennæ black; wing.cafes fmooth, flightly notched at the tip; abdomen covered with filvery down; tail emarginate; legs black.

Native of France.
Melanura. Black, wing-cafes reddifh or livid, the future and tip black. Schæff.

Inhabits Europe on flowers.
Levis. Black; wing-cafes and legs livid, future, and tip of the wing-cafes black. Fabr. Leptura futuralis.

Antennæ black; body clothed with filvery down. Native of Europe.

Livida. Black; wing-cafes teftaceous and without fpots; legs black. Herbit.

Wing-cafes rounded at the tip, and fcarcely emarginate. Native of Germany.
Vililica. Ferruginous; antennæ, wing-cafes, and breaft brown. Schaff., \&c. Fabr.

Inhabits Europe; firft joint of the antenne rufous.
Meridiana. Thorax fumewhat fpinous; wing.cafes fattigate; breatt chining. Schæff.

Male blackifh, female teftaceous; legs of the larva long. A native of Europe.

Strigilata. Black; wing-cafes teftaceous, with a blackifh fillet. Fabr.

Native of Sweden.
Emarginata. Black; wing-cafes purple, tip black, and emarginate. Fabr.

Inhabits Cayenne, the abdomen bidentated at the end; fegments fhining filvery at the bafe.

Sanguinolenta. Black; wing-cafes fanguineous. Linn. Fn. Su. Leptura dubia, Scop.

Native of Northern Europe.
Rubra. Black; thorax, wing-cafes, and fhanks purplered. Linn.

Inhabits Sweden.
Testacea. Black; wing-cafes teftaceous; fhanks rufous; thorax rounded behind. Fabr.

Found in the north of Europe, and is fuppoled to be the male of the former.

Revestita. Teftaceous; wing-cafes, breaft, and antennæ deep black. Schreber.

Native of Germany.
Pubescens. Black, with cikereous down, rib of the wing
teftaceous at the bafe. Fabr.
Inhabits Sweden.
Virens. Silky greenih; antenne varied with brown and green. Oliv.

Smaragdula. Silky greenif; antennæ and legs black. Fabr.

Inhabits Sweden.
Atra. Body entirely deep black. Oliv. Fabr. Lepsura atbiops, Poda.

Legs Cometimes teftaceous; abdomen with white filky down.

Humeralis. Black; fhoulders and abdomen ferruginous. Fabr.

Native of Germany.
Scutellata. Black; fcutel white. Fabr. Inhabits Italy.
Suturata. Cinereous; wing-cafes teflaceous, with a black future. Fabr.

Found in Germany; the antennæ teflaceous, with black tip; legs rufous, the joints black.

Exclamationis. Black; wing-cafes with a yellow line down the middle, and a dot at the bafe. Fabr., \&c.

A fmall fpecies found in Sweden.
Lumida. Ferruginous; wing-cafes teftaceous. Fabr., \&c.
Inhabits deferts of Hircania.
Femorata. Black; thighs rufous at the bafe. Fabr. Found in Saxony.
Ruficornis. Black; antennæ and legs rufous. Fabr.
Native of Italy. Body covered with yellowihh down.
Marginata. Black; margin of the wing-cafes and hind fharks rufous. Fabr.

Inhabits Norway.
Nigra. Wing-cafes tapering; body black, polifhed; abdomen red. Schæff.

An European fpecies.
Praeusta. Body covered with golden down; head and tip of the wing-cafes black. Fabr.

Firft joint of the antennæ ferruginous; legs red.
Native of Europe.
Quadrimaculata. Black; wing-cafes teftaceous; with
a black ring. Oliv.
Native of Germany.
4-Guttata. Brown; wing-cafes black, with two ferruginous dots at the bafe. Fabr.

Inhabits Saxony.
Rostrata. Dull braffy; legs yellow. Fabr.

- Subspinoza. Black; wing-cafes teflaceous, with four
black bands, the firt punctured; antennæ and legs yellow. Fabr. \&c.

Perhaps the female of the laft. Head black, with a ful. vous frontal band; wing-cafes emarginate; three fegments of the abdomen yellow. Native of Germany.

Aurulenta. Black; fore and hind margin of the thorax golden; wing-cafes teftaceous, with four fimple black bands. Fabr.

Inhabits Germany; fegments of the abdomen edged with white.

Dubia. Black and fomewhat villous; wing-cafes teftaceous, dotted with black; legs black. Fabr.
Native of Siberia. Allied to Leptura attenuata.
Sexguttata. Black; wing-cales with three yellow fpots. Fabr.
Inhabits Germany. Herbft.
Quadrifasciata. Black; wing-cafes teflaceous, with
four indented black bands. Linn. Leptura octomaculata, Degeer. Cerambyx fafciatus, Scop.

Native of Europe.
3-FAsClata. Black; wing-cafes with three yellow bands, the firft interrupted. Fabr.

Antennx pale alh, with the bafe black; firt band on the wing-cafes compofed of two dots, the fecond with a fmall tooth, the third lunated. Inhabits Sweden and Germany.

Reticulata. Black; wing-cafes teftaceous at the bafe, reticulated with yellow, and tipped with black. Fabr.
Native of Italy. The antenne black; joints at the bafe yellow; legs rufous, with black joints.

Sericea. Green-blue; wing-cafes fomewhat faftigate. Fabr.

This and the feven following inhabit Europe.
Collaris. Thorax globular, and with the abdomen red; wing-cales black. Fabr.
Virginea. Thorax globular and black; wing-cafes violet ${ }^{\circ}$; abdomen rufous. Oliv.

Carmonarra. Black; wing.cafes teflaceous; tipped with brown. Linn.

Native of Africa. Antenne yellowifl at the bafe; thorax and wing-cafes fmooth.

Lutercornis. Yellow; thorax with two black lines; wing-cales with four black bands. Fabr.

Inhabits Carolina. Head and antennx yellow; legs yellow ; polterior thighs with a black ring.

4-Pustulata. Black; wing-cafes with two remote fermaginous fpots. Fabr.

Native of Sweden.
8-Maculata. Black; wing-cafes livid, with four black fpots. Scheff.
An European fípecies.
Interrogationis. Black; wing-cafes yellow, with a longitudinal curved black line, and four marginal fors. Linn. Donov. Br. Inf.

Native of the northern parts of Europe.
Marginella. Blackifh; future of the wing-cafes, two marginal fpots, and tip yellow. Fabr.

An iuhabitant of Italy.
6-Maculata. Black; wing-cafes teflaceous, with three indented black bands, the anterior one a little interrupted. Scheff. \&c.

Native of Europe.
7-Punctata. Black; thorax teftaceous, with a black dot; wing-cafes teftaceous, with feven black dots. Fabr.

Small, linear; head with a large frontal teftaceous〔pot; abdomen teftaceous; legs black. Native of Hungary.
i2-Maculata. Black; wing-cafes yellow, with fix large black fpots on each. Fabr.

Native of Siberia.
Atrenuata. Wing-cafes tapering, yellow, with four black bands; legs teftaceous. Scheff.

Inhabits Europe ; abdomen entirely black, or rufous, with the tip black.
Calcarata. Black; wing-cafes tapering, yellow, with four black bands, the firlt punctured, fecond interrupted; pofterior Chanks bidentated. Herbtt.

- Nigella. Black; wing-cafes teftaceous; anterior fhanks rufous. Linn.

Erythropus. Black; legs red; bafe of the thighs, tips of the fhanks, and ends of the legs black. Limn.

5-Maculata. Black; antennx annulated with black; legs and wing-cafes teffaceous, the latter with five black fpots and three bands. Linn.

Fusca. Brown, with golden down; bafe of the antenne teftaceous; fore thighs and fhanks teflaceous, the former with four teftaceous bands, the latter tettaccous at the bafe. Linn.

Monio. Thorax orbicular; body entirely black and polifhed. Fabr.

Native of Sweden.
Cerambyciformis. Black, with whitifh down; wingcafes yellowifh, with five black fpots and a line in the middle. Herbit.

## Found in Hungary and Auftria.

Russica. Black, with whitifh down; wing-cafes yelIowifh, with five black fpots and a line in the middle. Herbit.

Inhabits Ruffia.
Levis. Black, beneath filky; antentre yellowih.brown; anterior legs ferrugisous. Herbft.

Native of Pomerania.
Solistifialis. Black; antenna ferruginous at the bafe;
legs and wing-cafes yelluw, the latier edged with black. Herbit.

Inhabits Pruflia.
4-Notata. Black, with yellowihh down, beneath with whitih; anteme brown at the bafe; thighs ferruginous at the bafe; wing-cafes punctured with two orange fpots. Herblt.
Same country as the preceding.
Splendidat Black, with yellow down; wing-cafes glabrous at the tip; legs fulvous; antenna brown, with ferruginous bafe. Herbla.

Inhabits Germany.
Plumipes. Brown, punctured; thighs fubclavated: hind-legs very long, the flaank; rufous at the tip. Pallas. Country unknown.
Ruripes. Black; legs rufous; thighs black at the bafe. Schaller:

Native of Germary,
Octo-macllata. Black; wing-cafes teflaceous, with
fix black fots and tip. Schaller.
Inhabits Saxony.
Schallebr. Brown; bafe of the fhells with fout rufous fpots. Schaller.

Iohakits Germany.
Pumila. Brown; anterior legs teflaceous, the thighs black above. Schaller.

Native of Saxeny, A rare fpecies, found on rhamnus catharticus.

Ustufata. Black; thorax and wing-cafes teftaceous, tipped with black; legs teftaceous.

Inhabits Germany on flowers.
Parisina. Black; bafe of the antenne and thighs reddih. Thunb.

Oblong, narrow. Inhabits Germany.
Bipustulata. Wing-cales black, ftriated with dots,
and marked with two teltaceous \{pots。 Thunberg.
Inhabits Upfal.
Scopolis. Abdomen and thorax at the pofterior margin red; wing-cafes teflaceous, pellucid, and attenuated; tip and margin below the middle black. Scop.

Nrgripes. Black; wing-cafes dull yellow-teftaceous; legs black. Gmel. Degeer, \&c.

Country unknown.
Verna. Black; anterior fhanks fulvous. Müll.
Native of Denmark.
Maculosa. Black; wing-cafes livid-teftaceous; antenne fotted with black. Degeer.

Country unknown.
Luneulata. Black; thorax with a narrow yellow band
behind; wing-cafes with two ferruginous lunules. Swederus.

Inhabits the Cape of Good Hope.
Bicolorata. Pale ferruginous; eyes, wing-cafes, wings, and tail above black. Leptura bicolor, Swederus. Native of America.
Vittata. Pale teflaceous; antennæ annulated with fufcous; wing-eafes dotted with black, with four yellow Atripes. Swederus.

Inhabits America.
10-Punctata. Black; thorax fubglobular; wing-cafes with ten dots. Lepech.

Inhabits Ural.
Varia. Villous, hoary; thorax fubglobular; wingcafes black with white dots, and four interrupted bands. Lepech.

Same country as the former.

Vikiols. Grecnifl ; thorax fomewhat ovate, with two darker lines; the back black. Lepech.

Native Siberia.
Nitris. Thorax globular, and with the abdomen black, with yellowifh thining down; wing-cafes black, with four broad yellow bands; legs ferruginous. Foriter.

Intabits North America.
Bhlineata. Blackifl-brown; thorax with two yellowifh lines; wing-cafes with feattered dots. Scop. Found in Carniola.
C.irlle.. Diuc ; anterior flanks rufuus. Scop. Native of Italy:
Squalida. Black; wing-cafes teffaceous at the bafe and inner margin. Scop.

Same country as the former.
Bipartita. Black; thorax ferrugimons with a black line ; wing cafes with a common ferruginous fpot. Schrank. This and the two following are natives of Germany.
Ferruginea. Black; wing-cafes ferruginous, with a broad patch of black. Schrank.

Lameda. Black; wing.cafes with three white bands. Schrank.

Macelata. Black, with yellow downy fouts; thorax globular; antentre half as long as the body. Geoffr.

This and the five following are inhabitants of France.
Nevid. Black, with yellow down; wing-cafes with two black glabrous fpots. Geofir.

Puscrclata. Blackif; head and thorax red, dotted with black. Geoffr.

Strigosa. Yellow downy; wing-cafes with three narrow black bands. Geoffr.

Gallica. Blue; fhanks rufous; thorax fubglobular. Geoffr.

Crassipes. Deep black; thighs thick and rufous. Geoffr.

Bmaculata. Rufous; thoras cylindrical; wing-cafes dotted, with a frot and waved line of white. Müll.

Iuhabits Europe.
Villos.a. Black, villous; thorax cylindrical, with pale longitudinal line. Müll.

Native of Denmark.
LEPTURUS, in Botany, from $\lambda เ$ mins, flender, and $8 \mathrm{p} x$, the tail of an animal, a genus of grafles, eltablifhed by Mr. Brown, Prodr. Nov. Holl. v. I. 207, and fo called from its long dender cylindrical fipe. It is founded on Rottbollia refens, Forlt. Prodr. 9. u. 50, with a quettion whether $R$. incurvata of Linneus and Fl. Brit., as well as $R$. filiformis of Roth, may not belong to the fame. The chisef difference between Leftrurus and Rottbollia feems to lie in the joints of the fpike being lingle-flowered in the former, twoHuwered in the latter; for in the detail of the florets, refpecting the prefence or imperfection of the parts of impreynation, this tribe of grafles, and indeed all grafles, are to be trulted with great caution.

Leiturus, in Ichthyol.gy. The name is of Greek origin, and is formed of $\lambda s a i z s$, fander, and $\operatorname{cog} x$, a tail, expreffing that the fifn bearing thas name has a wery long and flender tail. Sec Trichuches lepturus.

Lepturls, in Ornithology. See Pinaeton athereus.
LEPUS, the Hare, in Afronomy, a conltllation of the fouthern hemifphere; whole fars in Ptolemy's catalogue are twelve; in that of Tycho thirteen ; in the Britannic catalogue nineteen. See Constellatios.

Lepus Aqueus, the suater-bare, in Ornithology, a name fiven to the creft 1 diver, or colymbus of America, which is the farse fpecies with the large European kind, though

## L. E P

deferbed by many authors as a different bird. It has the name of the fea-bare or water-bare, from its great nimblenefs in the water. It is caught with much difficuly; and the Mexicans have a thoufand fabulous flories about it. See Colymbus crifatus.

Lepus, in Zoology, a genus of the order of Glires, in the clafs of Mammalia, the characters of which are that the animals of this genus have two fore-teeth in each jaw ; in the upper jaw is a fecond inner row of fore-tecth, which are confiderably fmaller than the outer or primaries; the forefeet have each five, and the hind-feet four toes. - Thefe animals are very timid; they live on vegetable food; and they ufe the hind-feet in walking as far as the heel, running by a kind of leaps, or repeated bounds. They have cither exceedingly fiort tails, named fiuts, or none at all.

$$
\because \text { With tails. }
$$

1. L. Tijifaccia, Vizcacha, Vifcachos, the Peruvian hare, with a longifh tail, befet with britles. Molin. Hilt. Nat. Chil. Hares of this fpecies inhabit the p'ains and bafes of mountains in the colder parts of Peru and Chili. The fur is of a moufe colour, and fo fine and foft, that, in the time of the Incas, it was woven iuto cloth for the Peruvian nobles, and is that employed for bonnets by the Chilefe. In habit and manner this ipecies refembles the rabbit, and digs holes under ground, in which are two contiguous chambers, one in which it fleeps, and the other, which is lower, is employed for eating its provifions, that are collected in the night ; the tail is bufly, and much longer than that of any other fpecies, and in general it turns up and is ufed as a weapon of defence.
2. L. Timidus, common hare, has a very fhort tail, the ears longer than the head, and black at the ends. Of this there are two varieties, viz the horned common hare, L. timidus cornutus, having flightly branched horns, an animal probably fabulous; and the yellow common hare, L. timidus melinus, of a fraw colour, of the fame fize with the hare, and running like it. Cook's Voy, iii. Pemnant's Quad.

This fpecies inhabits the whole of Europe, and more plentifully in Bulgaria; in the northern parts of Perfia, Japan, Ceylon, and almot the whole of Afia; in Egypt and Barbary; in North America, and even in Chili. The hare is very timid, very quick in its fight and hearing, and very fwift, particularly in running up hill; when hunted it runs circularly, gradually leffening the circuit, and often doubling back parallel to its path, and leaping through a great interval at the turn, in order to throw off the dogs. (See Hare Hunting.) The hare fecds only by night, and cliefly on the twigs and bark of flrubs and young trees. It is hunted for fport with dogs or hawks, and, in India, with fome fpecies of the cat genus. It is faid to be fond of the found of a drum; it is much infetted with fleas; it does not burrow, but makes a kind of neft, called by fportfmen a "form," among bulhes or long grafs; its urine is fuetid, which it takes care not to dit-charge in its neft. It does not pair, but breeds often in the fummer and ipring, the male purfuing the female, when in feafon, by the fcent; after coing 30 or 3 I days, the female brings three or four at a litter ; and as hares are very lafcivious, fuperfetation is not uncommon. It is about two feet in length, when full grown between eight and nine pounds in weight, fometimes, though rarely, twelve; the head is oblong or oval; the ears long and tipt with black, the eyes large, prominent, and black, placed much outwards, and provided with a nictitating membrane, which remains open when the animal is afleep; the upper

## L E P U S.

lip is divided; the fnout furnifled with long white whinkers, the chin white; the fur on the face, back, and fides white at the roots, black in the middle, and tawny red at the ends; the brealt and throat are reddilla ; the belly is white ; the tail is black above and white bencath; the hind thighs are ftrong, thick, and flelly, with a cavity on cach fide at the pubes; the feet are thickly covered with hair on the foles. 'This animal is fond of birch, parfley, and pinks. Its fleh was forbidden by the Druids, but much elteemed by the Romans. For other particulars, fee Habe.,
3. L. Fariabilis, varying hare, Alpine bare, has a very flort tail, the ears fhorter than the head; the whole fur beconies white in winter, except the tips of the cars, which remain black. Of this fpecies there is a variety, called the L. variabilis bybridus, or fpurious varying hare, the fides of which only turn white in winter. This fpecies inhabits the coldeft and moft hilly parts of Europe and Afia, as Scotland, Norway, Lapland, Ruffia, Siberia, Kamtfchatka, Grecnland, and in America, about Hudfon's bay, and Labrador. The fpurious varicty is a mixed breed, between the varying and conmon fpecies, fuftaining a partial change of colour, and found ouly in the fouthern and weftern parts, of Siberia. In autumn the varying hares fometimes collect in flocks of 5 or 600: driven from the mountains of Ruffia and Siberia, they migrate in quett of fubfiltence into the lower country, and return in fprang. The flefh of this fpecies is harder, drier, and lefs flavoured than that of the common kind. It never mixes with the common fpecies, but keeps on the tops of the higheft hills; it does not run fwiftle, but when purfued, takes fhelter in the clefts of rocks; is eafily tamed and very frolickfome; fond of honey and fweatmeats; it eats its own dung before a florm; changes to white in September, and recovers its grey colour in April; and it is fubject to thefe changes when kept in a warm room; in Greenland, it is always white. Penn. Quad. Arctic Zool. Foriter. Phil, Tranf. lxii.
4 L. Nizer, the black hare, has a very fhort tail, fur entirely black, or very dark tawny, the whole year, and inhabits Siberia, and the government of Caffan. It is much larger than the common kind, and very gloffy.
5. L. Amcricanus, American hare, Hudfon's bay hare, Hudfon's bay quadruped, Phil. Tranf. lxii. with the tips of the ears and tail grey, has a very fhort tail. The hind legs are a half longer than the body; the tips of the ears and tail grey. This fpecies inhabits North America. In New England, Canada, and farther north, this fpecies acquires a long, filky, filver-white coat of fur during winter, the edges of the ears only remaining grey: to the fouth it retains the whole jear a fhort fur of an afh colour, mixed with rulty and black; on the neck and body, the legs pale-afh colour, and the belly white. It is fmaller than the common hare, thelters in hollow trees and under fallen timber, and breeds once or twice a year, producing from five to feven at a litter; the fore legs are proportionally thorter, and the hind legs confiderably longer than thofe of the common kind.
6. L. Tolai of Buffon, Baikal hare of Pennant, the Daurian hare of Erxleb, the cuniculus leporin:s of J. G. Gmelin, has a thort tail, and the edges of the ears black. This fpecies inhabits the country beyond the lake Baikal, in the defert of Gobi or Cobi, and as far as Thibet. This is larger than the former feccies; in fummer of much the fame colour with the varying hare, and in winter a little paler; the legs are fmaller and the hind legs longer; the tail longer than that of a rabbit, but fhorter than that of the common hare, and like that black, efpecially at the root. It does not burrow, runs ftraight forward when purfued,
and fhelters in the holes of rocks. Its fefh is white, like that of the rabhit.
7. L. Minimus, Chilefe hare, has a very fhort tail, and the ears of an uniform colour. Molin. H.N. Chil. This fpecies inhabits the kingdom of Chili. It is finall, not exceeding the lize of a mall rat ; its budy is of a eonical form, its ears are fmall and flarp-pointed, its fnout is lengthened, the fur is fine and very flort; the flefh is white and good for food. It refembles the domeftic rabbit in variablenefs of colour, in its prolific quality, producing almolt every misath fix or feven young ones at a time; and in Chirit it is dometticated.
8. L. Capenfis, Cape hare, has a buthy tail, as long as the head, and red feet. It inhabits the country three days' journey from the Cape of Good Hupe; dwells in the fiffures cf rocks, and does not burrow; about the fize of a rabbit, and probably the fame animal that is mentioned by Adaufon as found in Cfinea, which, he fays, is fmaller than the common kind, with a colour between that of a rabbit, and has white flefl.
9. L. Cuniculus, common rabbit, has a very fhort tail, almoft of the fame colour with the bodj, ears black at the points, and hind legs fhorter than the body. Of this fpecies there are the following varietics, viz. cuniculus ferus, or wild rabbit, of a brownifh-grey colour; cunic. domeflicus niger, of an uniform black colour; cun. domeflicus albus, of an uniform, white colour, with fiery red eyes; czn. domeflicus variegatus pied tame rabbit, of a pied or mottled black and white colour; cun. domefficus argenteus, fitvery tame rabbit, of a filvery grey or alh-colour, with tawny feet. 'This fpecies inhabits naturally the warmer parts of Europe, Afia, and Africa; it is not a native of Britain, but has fubifted in a wild and tame flate in this country for feveral ages. It occupies principally dry fandy foils, in which it forms long winding burrows; confining itfelf to thefe holes in the middle of the day, and wandering in the evening, night, and morning, in fearch of food. It feeds on all kinds of green vegetables and grain. Its fleth is white and much efteemed. The female breeds fix or feven times in a year, going 30 or 3 x days with young, and bringing from four to eight at a litter : it acquires its full fize in fix months, and lives about eight or nine years; the male is very lalacious, and apt to deitroy the young; rabbits are preyed upon by hawks, badgers, and polecats, and are caught by means of terriers, nets, and ferrets. Numbers of them are bred in a wild Itate in places fet apart for the purpofe, called " warrens," and many are bred in houfes in a domeftic itate. The wild varicty is of a brown afh-colour, having the upper part of the tail black, and the under part white. The fur of the filvery variety is valuable.
10. L. Satcatus, hooded rabbit, Ruffian rabbit, has a double fold of the fkin behind the head, and another under the throat. This animal's habitat is unknown. It is defcribed by Mr. Pennant, from a drawing in the Britif Mufeum by Mr. Edwards, and called by him a Ruflian rabbit, but it is unknown in that empire.
11. L. Scricens, Angora rabbit, is covered with long, waved, filky hair. The Ruffian rabbit is reckoned by Gmelin a variety of this. It inhabits Angora in Afia Minor, and is exccedingly beautiful on accoumt of its fine, white, filky fur, which is a valuable article in commerce.
** Having no Tails.
12. L. Brafilicnfis, Braflian hare, named "Tapeti" by the natives, has very large ears, no tail, and, for the molt part, a white ring or collar round the neck. (Pallas Glir.) This fpecies inhabits So:th America and Mexico; it is of

## l. E P

the fame colour and magrinude with the common hare, but darkes, with timilar large ears; in its general appearance it refembles the rabbit. It lives in the woods, dues not burrow, and its flefh is good food.
13. L. Pufillus, calling-hare of Pennant, has no tail, triangular ears, white at the edges; the upper parts of the body are dark-brown, mixed with blackith-grey, and the under parts hairy. (Schreber.) This fpecies inhabits the fouthern extremity of the Ural mountains, about the lrtifch and the funny hills to the fouth of the Altaic chain. It feeds chiefly on the flowers and bark of the Cytifus fupinus, Robinia frutefcens, Cerafus pumila, and Malus fylveltris; digs holes in dry places, amid bufhes, and leads a very retired life, near its burrows, which are long and intricate, with a very fmall entrance. Thefe animals are difcovered by their voice, which is very loud and fonorous, like the piping of a quail, and may be heard at a great diftance ; it is repeated at fhort intervals, three, four, or ceren fix times, montly at night and morning, and never in winter or bad weather. This fpecies is gentle, and eafily tamed; it neeps little, drimks frequently, and is moft active in the night feafon; its pace is not quick, but by leaps.
14. L. Alpinus, Mountain hare, Alpine hare of Pallas, \&c. Multela Daurica, or Daurian weafel, has flort rounded ears, and no tail, is of a bright bay colour, with brown ears and hind feet. (Schreber.) This animal inhabits the Altaic chain of mountains, to the extremity of Afia, and beyond the Lena and Yenifei, occupying the moft rugged and inacceffible fhelves of the mountains, burrowing in the clefts of the rocks, or living in the hollow trunks of decayed trees. Its voice or cry refembles a loud whiftle. The mountain hare is preyed on by fables and Siberian weafels, and is much infetted by the Oeftrus leporinus, a fpecies of gad-Ay, which lodges its eggs in their kins, and often deftroys them. This fpecies varies in fize from feven to nine inches in length, and weighs from $1 \frac{1}{4}$ pound to four ounces.
15. L. Ogotona, the Ogotona hare, or Mongalian weafel, hias oblong, oval, fomewhat pointed ears, of the fame colour with the body, which is pale grey ; but it has no tail. (Schreber.) It inhabits the mountains beyond the lake Baikal, and all Mongalia, efpecially the great defert of Cobi; dwelling fometimes in rocky places, among fones, or forming in the fand with two or three entrances. Its voice is fharp and clamorous; it feeds chiefly on the bark of the Pyrus baccata, and on the fuckers of the dwarf elder, and in furing on various herbs which grow on the fandy foil. It is nimble, and fcarcely capable of being tamed; it is preyed upon by various fpecies of the weafel tribe, by the Manul cat, hawks, wood-peckers, and owls; it differs from the calling and mountain hares, chiefly in fize, being about $6 \frac{1}{2}$ inches long. It procreates in fpring, and the young ones are fully grewn by the end of June.

LEPYRODIA, in Botany, $\lambda$ stupwine, facly, fo callecं on account of the inner fcales at the bafe of each flower. Brown Prodr. Nov. Hollo v. I. 247.-Clafs and order, Dioecia Triandria. Nat. Ord. Tripetaloidea, Linn. Junci, Juff. Reftiacea, Brown.

Eff. Ch. Flowers either dioecious or hermaphrodite. Petals fix, nearly equal, prominent, with one or two fcales at their bafe, within the proper fcale of the fpike, or catkin.-Male, Stamens three. Anthers fimple, peltate. A rudiment of a piftil. Female, Styles three. Capfule of shree cells, three-lobed, burfing at the prominent angles. Seeds folitary.

This genus is very near Elegia, Linn. Mant. 2. 162, (which was afterwads funk in $R_{f} f i o$ ), but differs in the
prefence of inner fcales to the flowers, and in the male flowers being like the female, with nearly equal petals, as well as in having the fheaths of the ftem permanent, not feparating juft above their bafe, and in the firaller fize of the fpathas. The Calorophus of Labillardiere nearly anfwers to the above character, but is a totally different plant.

1. L. gracilis. Stems fomewhat branched. Sheaths tight. Spike compound; its lower branches rather diftant. Three outer petals fhorteft. - Gathered by Mr. Brown at Pore Jackion, New South Wales.
2. L. friala. Stems perfectly fimple. Sheaths tight. Spike compound; its branches rather crowded. Petals all nearly equal. - Native of the fouth coaft of New Holland.
3. L. farriofa. Stems perfectly fimple. Sheaths lax. Spike compound; its branches imbricated, divided. Three inner petals fmaileft. Found at Port Jackfon.
4. L. bermaphrodita. Stems perfectly fimple. Sheaths lax. Spikes nearly fimple. Flowers hermaphrodite. Found on the fouth coalt of New Holland.
Our account of this genus is entirely taken from Mr. Brown's work, with fome flight difference in terms, according to what we have ufed in the articles Leptocarpus and Lepidosperma.
LERANG Point, in Geography, a cape on the N. coaft of the inland of Java. S. lat. $6^{\circ} 37^{\prime}$. E. long. $111^{\circ} 27^{\prime}$.

LERAY, a town of France, in the department of the Cher, and chief place of a canton, in the diftrict of Sancerre ; 8 miles N. of Sancerre. The place contains 1109, and the canton 6544 inhabitants, on a territory of 170 kiliometres, in 7 communes.
LERCHEA, in Botany, was fo named by Linnzus, as a tribute of refpect to the botanical acquirements and publications of John James Lerche, principal phyfician to the Ruffian armies, who was born at Potrdam in the year 1703, and who died at St. Peterßurg in 1780 . He publifhed a defcription of certain plants growing at Aftrachan, and in the provinces of Perlia which border on the Cafpian fea. This tract is printed in the 5 th vol. of the New Traniactions of the Academy Nature Curioforum, Appendix 161. 206. He alfo furnifhed an account of the Nymphaa Nelumbo of the Cafpian fea. Haller mentions that Lerche made many curious obfervations on the agriculture and botany of the countries through which he travelled.-Linn. Mant. $155^{\circ}$ Schreb. 453. Willd. Sp. Pl. v. 3. 586. Mart. Mill. Dict. 7. 3. Juff. 42 r.-Clafs and order, Monadelphia Pentandria. Nat. Ord. unknown.
Gen. Ch. Cal. Perianth of one leaf, tubular, five-toothed, permanent. Cor of one petal, fumnel-fhaped ; tube longer than the calyx; limb fivecleft, nearly erect. Stam. Filaments fearcely diltinet from the tube of the germen; anthers five, oblong, placed upon the tube of the germen. $P_{i j /}$. Germen fuperior, fomewhat ovate, terminated (within the corolla) by an obtufe tube; ttyle within the tube of the germen, thread-flaped, the length of the ftamens; ftigmas two or three, rather obtule. Peric. Capfule fomewhat globofe, torulofe, of three cells, fometimes only two. Sceds numerous.

Eff. Ch. Calyx five-toothed. Corolla funnel-fhaped, fivecleft. Anthers five placed on the tube of the germen Style fingle. Capfule of three ceills and many feeds.

1. L. Pongicauda. Linn. Syft. Vez. ed. 14. 6ro. Mant. 256. There is no figure of this folitary fpecies of Lerchea, which is a native of the Eaft Indies, and a Arub of irregular growth, furnifhed with Araggling jointed branches. Leaves oppofite, on foot-italks, lanceolate, fonooth, entire, a foot in length. Stipulas fword-fhaped, Thorter than the leafftalks.

## LER

## L ER

falks. Spike terminal, nender, a foot high; flowers remote, fcattered, finall.
The above defcription is entirely taken from the works of Limeus; the only perfon who cver faw the plant. No trace of it is to be found in his herbarium, yet it is to be prefumed the fpecimen exifts fomewhere in his collection, probably without a name.

LERENZA, in Geography, a town of New Granada; 25 miles N. of 'Tunga.
LERGE, a town of Sweden, in Wert Gothland; 4 miles N . of Gothenburg.

LERI, Joun de, in Biograply, a French Proteftant minilter, was born at La Margelle, a village in Burgundy, and profecuted his academical lludies at Geneva. In 1556 he was felected to accompany two minitters, on a miffion to join an intended colony of the reformed religion in Brazil, under the protection of admiral de Coligny. On their arrival, they found their project fo involved with difficulties, that Leri returned to France in the following year, having endured altonifhing hardhips during his voyage. He afterwards was admitted to the office of the miniltry, and exercifed it at La Charitè, at the time of the maffacre of St. Bartholomew, when he was obliged to make a very hafly efcape to the town of Sancerre. It was during the memorable fiege of this place that he was granted a paffport from marfal de la Châtre, permitting him to retire wherever he pleafed: he went to Bern in Switzerland, where he was received in the moft kind and hofpitable manner by M. de Coligny, fon of the admiral. In 1574 he publifhed an interelting "Hiftory of the Siege of Sancerre :" giving an account of the tranfactions of that fiege, and of the horrors of famine to which the Proteftants fubmitted in defence of their religion, and all that was dear to them, which was widely difperfed, and went through many editions. In 1577 he publifhed an account of his voyage to Brazil. He died at Bern in 1611, greatly regretted by all who knew him. Bayle. Moreri.

LERIA, in Ancient Geograpby, an illand of the IEgean fea; one of the Sporades, according to Strabo.-Allo, a town of Spain, in the Tarragonenfis, and in the interior of the country of the Edetani. Ptolemy.

LERIDA, in Geography, meiently called Ilerda, a town of Spain, in Catalonia, diftinguifhed in ancient and modern hittory for the great events which have rendered it memorable. It was the capital of the country of the Ilergetes long before the firt invafion of Spain by the Romans, and had its own particular princes. In the plains of Lerida Scipio gained a fignal victory over Hanno, the Carthaginian general, A.U.C. 537. It was, likewfe, under the walls of this town that Julius Cæfar conquered the lieutenants of Pompey, A.U.C. 705. The beauty of its fituation and the fertility of the country attracted the attention of the Romans; and as foon as they had made a conqueft of it they planted colonies there, and gave it the title of "Municipium Ilerdenfe." This town, having fallen under the dominion of the Goths, embraced the Chritian religion, and was the feat of a celebrated council held here A.D. 528 , or 524 : A council held here in 546 is remarkable for two of its canons: one prohibiting eccleliaftics from fhedding human blood, and another permitting the commuvion to be adminittered to magicians when they are dying. After the conquelt of the Moors, it became at firft fubject to the caliphs of Damafcus, and afterwards to the Moorifh kings of Cordova; but its own governor erecting the ftandard of rebellion and ufurping the fupreme power, it had a feparate king. In II 49, Raymond Berenger, the lalt count of Barcelona, who had jult afcended the throne
of Aragon, trok Lerida from the Moors, and from that time it formed a part of Catalonia.

This town is fituated on the declivity of a hill, at the top of which the caftle itands, on the right and weft bank of the river Segra, which bathes the walls of it. It is long, narrow, almoft triangular, clofe, and ill built. It has s'ne tolerable ftreet, a quarter of a league in length, but, like the others, narrow and ill paved. A quay, lately built, extends through the whole length of the town, which forms a kind of promenade for the inhabitants. Their number is about 18,000 . It is an epifcopal fee, fuffragan to Tarragona. Its diocefe includes 150 parifhes; Lerida itfelf has one cathedral chapter, four parifhes, eight convents of monks, three of nuns, one hofpital, and one college. The town has a civil and military governor, a fmall garrifon, and an alcade-major for the adminiftration of juftice. Its univerfity, eftablifhed in 1300, by James II., king of Aragon, was fuppreffed by Philip V. at the commencement of the eighteenth century. The cathedral is the only edifice in Lerida that claims attention. Lerida formerly carried on a trade in falt-fifh, which has wholly failed. Its prefent commerce is confined to the exportation of fome productions of the land, chiefly fruits and pot-herbs; great quantities of which are fent to Urgel and Aragon. The adjacent country is very fertile, and valuable on account of the variety and abundance of its produce ; confifting of wheat, oats, flax, hemp, oil, wine, beans, and all kinds of excellent fruits and pot-herbs. The country is interfected with canals fupplied by neighbouring rivers, and is fkilfully and carefully watered. Some filk-worms are alfo bred here, but in no great number; 62 miles E. of Saragoffa. N. lat. $41^{\circ} 29^{\prime}$. E. long. $0^{\circ} 25^{\prime}$.
LERIKA, a town of Swedih Lapland; 100 mules W.N.W. of Tornea.

LERILLON, a fmall ifland in the Grecian Archipelago, near the N. coalt of the ifland of Lero.
LERIN, a town of Spain, in Navarre; 15 miles E. of Eftello.

LERINA, in Ancient Geography, Lerins; an ifland of the Mediterranean, upon the coaft of Gallia Narbonnenfis, S.W. of Nicæa. Strabo, who calls it "Planafia," from its form and fituation, fays that it had a garrifon.

LERINS, in Geography, a name given to two fmall iflands in the Mediterranean, near the coaft of France, about fix miles S. of Antibes; called "St: Marguerite" and "St. Honorat;" near thefe are fome other intets.

LERMA, a difmantled town of Spain, in Old Caftile, on the Arlanza; 23 miles S. of Burgos.-Alfo, a town of Mexico, in the province of Yucatan; 12 miles S. of Campeachy.

LERNA, in Ancient Geography, a lake or marfh, now called "Molini," is the Argolide, a little N. of Genefium. It is rendexed famous by the fable of the defeat of the hydra with many headṣ, which retired hither and was killed by Hercules. The people of the country pretend that near this lake Neptune ran away with Proferpine; in memory of which event were annually celebrated the myfteries confecrated to Ceres: and hence thefe mytteries were denominated the "Lernæan mylteries." Near the lake was a wood confecrated to this goddefs, which commenced at mount Pontinus. Paufan. Corinth. 1. ii. c. 36.

LERNEA, in Zoology, a genus of the clafs Vermes, and order Molluica, which is characterized by Linnæus as laving an oblung, fomewhat cylindrical and naked body; tentacles or arms two, or fometimes three on each fide and round, by which it affixes itfelf to any fubltance' two ovaries projecting like tails from the lower extremity. They are without

## L E R

eycs, and are very troublefome to fifli, adhering very firmly to them, chicfly to the gills and fins. There are fifteen fpecies, which we fhall brielly enumerate.

## Specics.

Brascmalis is one of the largeft, being about two inches in length. The body is round and flexuous, the mouth is lateral, and feated between three flightyly branched horns. It inhabits the northern feas, and is found adhering to the gills of cod-fifth. It is ufed as food by the Greenlanders. Müll. Zool.

The body of this fpecics is hollow, membranaceous, thicker before and behind; dull white, dirty red. The neck is long, tubular, and filiform; tail cnding in a perpendicular groove; ovaries two, compofed of long twilted cirri.

Cxprinacea. Body cylindrical, clavate behind; thorax forked; tentacula lunate at the tip. It has four tentacula, two of them lunate at the tips; it is only about half an inch long, and of the thicknefs of a fmall ftraw ; the body is rounded, of a pale greyifl-white, glofly on the furface, and fomewhat pellucid; it is thruft out of a kind of theath at the bafe, which is of a white colour, and a thick flin ; towards the other extremity of the body there are three obtufe tubercles, one of which is much larger than the reit. It is found on the fides of the bream, carp, and roach of our ponds and rivers, in abundance.

Salmonea, or Sulmon lonfe. Body obovate; thorax inverfely heart-fhaped; tentacula two linear and approaching -each other. It is rather more than half an inch long, and is found, as its name imports, adhering to the falmon about its gills. Barbut.
The body is pale and foft, head fmall, oblong, rather convex, with two horizontal lips; the upper one is armed with two rigid moveable hooks, the lower fhort, bifid ; abdomen inverfely ovate; ovaries round, granulate within, and as large as the whole body.
Asellina bas a lunated body, and cordated thorax, and is found in the gills of cod-fifh and ling. Barbut.

Huchonis. Body knotty; two tentacula; ovary doub'e and united behind; is found in the gills of the falmo hucho, in northern lakes and rivers. The body is clear white and fomewhat cartilaginous.

Clavata. Body cylindrical, fubfinuate and tripled beneath the tip and fnout. Muill. It is found in the fins, gills, mouth, and eyes of the Perca Norwegica.

Unciata. Body rather heart-fhaped; fnout fimple, curved, and the mouth terminal. Miill. It is found on the gills and fins of cod-fifh in the Grcenland feas. The body is foft, pale, with a longitudinal groove down the middle of the back; the 'ovaries are rounded and thickened towards the tip.

Gorres. Body rhomboid; it has two arms before and two behind, all of which are nodofe; the head is armed with two curved horns. Shaw. Müll. It inhabits the gills of the Cottus gobio, or Miller's thumb, and is nearly three quarters of an inch in length.

Body blueifh-white; head roundifh, with two incurved horns; the mouth is placed between the horns, and is furnifhed with three lips; the tentacula are angular, curved, knotty ; inteftines tranflucent above; tail bifid; ovaries fpiral, round, fubulate.
Rapiata has a fquare depreffed body, with three pair of arms and four horns. Mîll. It is found in and about the mouth of the Coryphrena rupeftris, in the Greenland feas. It is rather more than an inch in length; whitifh or cinereous, and rough with hardifh tubercles; the fides a little
crenate ; head depreffed, rounded, and copered with numerous papillx; ovaries large, oboval.
NodosA. Body 〔quare tuberculate; with two very fhort arms beneath on each fide. Muill. Shaw. It inlabits about the month of the Perca Norwegica.

Body foft, pale cinercous, convex above, and concave beneath, with four hard white tubercles in the middle of the back, and five white teeth on each fide ; head rounded, and divided by a ftreak in the middle.
Consuta. Budy oblong, with four ftraight emarginate arms; head fubovate. Shaw. Mûll. It is found on fome fpecies of the Pleuronectes.

Body covered with a pellucid fkin; front with ? wo horns and a fingle tooth; the mouth has two feclers ; ovaries brown, and its eggs are of a tawny colour.
Pectonalis. Head orbicular ; hemifpherical; abdomen obcordate, with a terminal truncate papilla. Müll. Shaw. It is found on the gill and pectoral fins of the flounder, or Pleuronectes fleflus, and other fpecies of the fame genus.

Body white, diaphanous, covered with fmall blackifh fpots ; the crown has two falciform projections ; fnout conic, truncate, with four minute horns, two hort fpines, and two feelers near the third conic fpine. Two tentacula, not curved; ovaries two, rather narrow, fub-annulate, and of equal diameters.
Lots, found on the gills of the Gadus lota, has four unequal ovaries ; the mouth has two hooks ; four cruciate appendages.

Cyclopterina. Body round, flexuous, with a double orifice in the middle of the fnout; fnout terminated by three horns, divided into three parts. It inhabits a fpecies of the Cyclopterus, or Lamp-filh.

Body refembles the branchialis above defcribed, but the horn is flender, turned up and entire at the tip; tail is narrower, with two convex lobes on each fide ; ovaries fimple, fpiral, and nearly five inches long when extended. There
is arother variety which is rather lefs and has greenifh ovaries.
Pinnarces is of a reddifh colour ; head cylindrical and roftrate on the fore-part ; it has two tentacula, which are lunate, and bifid at the tip. It is found on the dorfal fins of the Gadus barbatus.

Body deprefied, flefly, grooved on the back, with a cylindrical arm placed on the forc-part of the back, concealed in a groove; the ovaries long and cylindrical.

LERNEB, in Geograpby, a town of Algiers; 20 miles S. of '「ip\{a.

LERO, anciently Lero, or Leros, an ifland of the Grecian Archipelago, N.N.W. of that of Calamo (which fee). Strabo fays that it was formerly inhabited by a colony of Milefians. It is about eight miles long, and two broad. It has a good harbour and a few coves, and alfo high mountains, in whofe bofoms mines and quarries of marble might be worked; its foil is ungrateful, and its inhabitants are under the neceffity of feeking fuccours abroad by navigation and traffic. N. lat. $37^{\circ} 12^{\prime}$ E. long. $26^{\circ} 35^{\circ}$.

LERONA, a town of Ctaly, in the Orvietan ; 7 miles N.W. of Orvieto.

LEROT, or Garden Squirrel of Buffon, in Zoclogy. See Myoxus Nitela.

LE ROY le veut, a form of words, by which the royal affent is lignified by the clerk of the parlianient to public bills; to private bills this aflent is expreffed by foit fait comme il eff defiré.

Le Roy s'avifera. By thefe words to a bill, prefented to the king by his parliament, is underftood his abfolute denial

denial of that bill in a more civil way; and the bill thereby becomes wholly null and void. Sce Roval and Pahlianent.
LERVADILLA, in Geography, a town of Spain, in the province of Leon; 12 miles S. E. of Ciudad Rodrigo.

LeriwiA, or Lerwee, in Zoqlogy. See Astelope Lerwia.

LERWICK, in Geography, a fea-port town, fituated in a parifh of the fame name, on the ealt fide of the Mainland of the Shetland inles. It is diltinguifhed as the feat of the courts held by the fheriff-depute of this ftewartry, and as the general rendezvous of all the veffels employed in the whate-filhery: The harbour is one of the fafelt and largeft in Great Britain. It is formed by the ifland of Breflay, and is particularly commodious from the circumftance of having two entries, one from the fonth, and another from the north. On the outfide of the north entrance is a funk rock, which is called the Unicorn. It derived its name from the Unicorn man-of-war, which was fent in purfuit of the earl of Bothwell, when that nobleman fled to Shetlard. As this veffel appeared at the mouth of the fouth entry, before her approach was difcovered by the earl, he with difficulty efcaped by the north pafiage. The Unicorn eagerly purfued, but having no pilot on board, fhe ftruck upon this rock and was wrecked. The town of Lerwick is about half a mile in length, and is irregularly built, but contains feveral excellent houfes. Near the north end is a fmall fortification, called Fort Charlotte. It is ufually garrifoned by a party of invalids, and ferves to protect the north entry of the harbour. A bout a mile and a half. from the town are the remains of two ancient Danifh caltles. The parifh extends about fix milcs along the coalt, but at no point is more than one in bread h. The furface of the ground is for the molt part rocky and mountainous. Inmediately upon the fhore, however, there are many very fine arable fields, the foil of which, though light and fandy, poffefles confiderable fertility. The population of the whole parif, according to the parliamentary returns in 1800, amounted to 1706 perfons; abour 900 of whom are refident in the town. Sinclair's Statiftical Account of Scotland, vol. iii. communicated by the Rev. James Sands.

LESARA, a fmall ifland in the Baltic, E. of Aland. N . lat. $60^{\circ}$ IS. E. long. $20^{\circ} 19^{\prime}$.

Lesibian Cymatium. Sce Crmatium.
LESBIUM Marmor, a name given by the ancients to a fpecies of marble of a blueifh-white, fometimes ufed for the vafes and other ornamental works, but principally in the walls of public buildings.

LESBONAX, in Biography, a native of Mitylene, who flourihed in the firft century of the Chriltian era, was a difciple of Timocrates, afterwards became a teacher of philofophy in his native city, and obtained a great number of fcholars. He was author of many books of philofophy, and Photius fays he had read fixteen orations written by him. Two of thef, it is Appofed, have reached modern times, and were firf publifhed by Aldus, in his edition of the ancient orators, in 1513. They were afterwards publifhed by Henry Stephens o with the orations of Efchines, $L_{\text {yfias, }}$ and outhers. They were alfo publifhed, in I619, by Gruter. Lefbonax is faid to have been the author of a treatife "De Fjguris Grammaticis." He left a fon named Putamon, an eminent rhetorician at Rome, in the reign of the emperor Tiberius. So fenfible were the magittrates of Mitylene of his merits, and of the utility of his labours, that they caufed a inedal to be ftruck in his honour: one of which was difcovered in the fouth of France about four-
fcore years ago, and an engraving of it publifhed in 1744, by M. Cary, of the Academy of Marfeilles. Moreri.

LESBOS, in Ancient Gcography, now called Mctelin, an ifland of the Grecian Archipeladto, fituated N.E. and S.W. and occupying in its length the port of the gulf of Adramyttium, on the coaft of Afia Minor. It extended in latitude from $39^{\prime} 5^{\prime}$ to $39^{\prime}, 30^{\prime}, S . E$. of the ifland of Lemnos. It is foid, that the: Pelafgi firlt fettled themfelves in this ifland unser the conduct of Xinthus, fon of Triopus, king of the Pelafgi, driven from Argos, who paffed from Lycia to this inland, calted Iffa, and naried by him Pelafgia. Seven generations after this time, the iohabitants perifhed in the celuge of Deucalion, or rather in an inundation that overwhemed this ifland. It was then left defolate. In procefs of time Maccareus, an inhabitant of Ionia, afterwards denominated Achaia, formed an eftablifment in this inand. This prince was accompanied with Ionians and fome other people of different nations. Lefjus, it is faid, came hither fome time after Maccareus, his progen itor.
Euftathius, in his Commentary on the third book of the Odyffee, fays, that this ifland contained five towns, viz. Lefbos, whence it derived its name, Antiffa or Iffa, Pyrrha, Methymna, aud Mitylene, whence this ifland has been fince called Mitylene and Metelin. This lalt town was the capital, Lefbos, originally geverned by rulers chofen among its own inhabitants, became afterwards fubject to the dominion of foreign tyrants. It fuceffively paffed under the domination of the Perfians, and then under that of the Greeks, till its liberty was reftored to it by Alexander the Great. This liberty it preferved till the time of Pompey, who redured it into the flate of a Roman province; continuing, however, for fome time to Mitylene its ancient privileges. The Crufaders next eftablifhed themfelves for a certain period, and the Genoefe were malters of it when the empire of the Eaft fell into the hands of the Turks. It was on this occalion that Mahomet II. ten years after the capture of Conftantinople, equipped a confiderable fleet in order to fubdue it. Mitylene, Methymna, and moft of the places of this ifland had been well fortified; the knights of Rhodes fuccoured it; and the inhabitants, who knew the cruelties committed by the Turks at the capture of Conftantinople, were all difpofed to defend their lives. The Ottoman forces, although very confiderable, would undoubtedly have mifcarried againft thoufands of heroes, if thefe heroes had not been betrayed by the treachery of Lucco Gattilufio, who thought of obtaining the fovereignty of the ifland by delivering it up to Mahomet. Accordingly, he perfuaded his coufin Gattilufio to fign a fhameful capitulation. However, as a recompence for the treachery of the one, and for the weaknefs of the other, Mahomet caufed them to be cruelly put to death a fhort time after. Lefbos gave birth to feveral perfons of diftinstion; among whom we may reckon Alcæus, a lyric poet, who long declaimed againft tyranny; Sappho, the celebrated pociefs, whom antiquity has placed among the Mufes, and who, by an unfortunate paffion, was. impelled to precipitate herfelf from the promontory Leucates; Theophrallus, a dicciple of Plato and Ariftotle; Pittacus, whom Greece reckons among her fages, and who, more ardently defirous of the happinefs of kis fellow. citizens than of his own, conceived and exccuted the project of ufurping power in order to reftore liberty to his country ; and laftly, Potamon, barn at Mitylene, a diftinguifhed rhetorician, who lived at Rome under Tiberius. This latter, wifhing to return to his country, and there eftablih a chair of eloquence, obtained from Tiberius letters, in which it was exprefsly mentioned, that whoever fhould dare to infult Potamon, would infult in his perfon the em-

## L E S

peror himfolf. We might alfo mention, in more modern times, the two brothers, Barbaroflas, [ons of a porter, who from fimple failors, became famous pirates, and were afterwards, in fucceffion, fovereigns of Algiers. The younger, appointed high admiral by Soliman I, is more known than his brother in the hitlory of the Ottoman empire. For an account of the prefent flate of Lefbos, fee Metelin.

LESCAILLE, James, in Biography, a Dutch prirter and poet, born in 1610 , was defcended from a family of diftinction and much confideration at Geneva, which took refuge in Holland on account of fome perfecution. By profeffion he was a printer and bookleller, and gained great reputation by the beauty and accuracy of various editions of books which he publihed. He was in high eftimation as a poet, and was noticed by the emperor Leopold. He died in 1677, leaving behind him a daughter, Catherine, born is 1649, and fo difinguifhed by her poetical talents, that the was called the Dutch Sappho. Her brother-in-law, Ranck, publified, in 1728 , a volume of her works, which contains feven tragedies, befides other pieces. She died in 1711. Moreri.

LESCANO, in Geography, a town of Spain, in the province of Guipufcoa; 9 miles S.S.W. of Tolofa.

LESCAR, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the diftrict of Pau; 3 miles N.W. of Pau. Before the revolution, it was the fee of a bifhop, fuffragan of Auch. The place contains 1885 , and the canton 7823 inhabitants, on a territory of $177 \frac{1}{2}$ kiliometres, in 15 communes.

LESCHERES, a town of France, in the department of the Upper Marne; 9 miles S. of Joinville.

LESCIVER, a town of Perfia, in the province of Irak ; Ior miles W. of Hamadan.

LESCZYN, a.town of Poland, in Volhynia; 24 miles N. of Berdiczow.

Lesdigueres, Francis de Bonne, Duke of, in Fiography, was born of an ancient family, in the Upper Dauphine, in 1543 . He was brought up to the military profeffion, and acquired, while he was yet a young man, fo much reputation for fkill and true courage, that he was chofen by the Calvinifts of his native province their leader, after the death of Montbrun. Soon after the command devolved upon him, he took a number of provinces, and at length the capital of Grenoble. This was in the year 1590. When the duke of Savoy, taking advantage of the difturbances in France, projected an invafion of Provence and Dauphinè, I.efdigueres, who acted as an independent commander, covered the latter province with his arms. He now fent to court to demand the government of Grenoble, which Henry IV. could not grant him, as he had, by the advice of his council, referved it for a Catholic ; the envoy being refufed his requeit, he applied to the council affembled, ${ }^{6:}$ Gentlemen, if you do not thisk it proper that my mafter flould have this government, you hould think of the means of taking it from him." This energetic anfwer was not difpleafing to the king, who was glad to be under the neceffity of promoting a general of the Proteftant perfuafion. Lefdigueres was, from this time, appointed lieu-tenant-general of the king's armies in Piedmont, Savoy, and Dauphine, and by his vigilauce and activity difap. pointed all attempts of the duke of Savoy, who was accuftomed to call him the fox of Dauphine. When that prince was conftructing a Arong fort on the French territory, Lefdigueres was reproached by the king for allowing it, to which he replied, "Your majelly has occafion for a good fortrefs to bridle that of Montmelian. Since the duke of Savoy is willing to build one at his ex-
pence, let him do it : I engage, as foon as it is completed. and furnifhed with cannon and ammunition, to take it from him." He performed his promife, and his fervices were rewarded, in 1608 , with the itaff of a marfhal of France, and his eftate of Lefdigueres was erected into a dukedom and peerage. In the fucceeding reign' he faved his old antagonilt, the duke of Savoy, when attacked by the armies of Spain. In 1620, when the civil war was renewed, he received great offers from his party, the Calvinifts, to accept the poft of commander-in-chief, but he preferved his fidelity to the-king, and accompanied him into the field. Upon the death of the conftable of France, nothing but his religion ftood in the way of his fucceeding to the liigh office, and this obftacle he removed by abjuring the Calvinitic creed. The patent which conferred upon him the office, gave as a reafon for his appointment, that it was on account of "6 his having been always victorious, and never var. quifhed." Having apoltatized from his creed, probably for the fake of honours and wealth, of which he was exceedingly avaricious, he did not hefitate to take the command againft his party, and was uniformly fuccefsful in the fervice, till his death, in 1626 , when he had attained to the age of eighty-four. Notwithftanding his defects, Lefdigueres had a great mind: while leader of the Calvinifts, his principal domeftic was bribed to affaffinate him : the plot was dif. covered, and taking the man afide, he ordered him to arm, at the fame time he armed himfelf: "Since you have promifed," faid he, "to kill me, try to do it now, and do note forfeit your character for valour by an act of cowardice." The man threw himfelf at his feet, confeffed his crime, and the general not only pardoned, but continued to employ him.

LESIGNA, in Geography, a town of France, in the department of the Aude; iI miles W. of Narbonne.

LESINA, anciently Pbaros, an ifland in the Adriatic, between Brazza and Corzola Nigra, about 44 miles long, and $5-8$ broad, lying from W. to E. in N. lat. $43^{\circ} 30^{\prime}$. In the higheft parts it is rocky and barren, but neverthelefs contains fome good land, yielding abundance of corn. Its principal productions are alfo wine, oil, figs, almonds, faffron, honey, aloes, oranges, wool, cheefe, and falt. Marble, in great quantities, is found on the ifland. Salt-fifh is the chief article of commerce. Its capital is Lefina; which is a fmall, fortified town, at the bottom of a bay near Cape Pellegrino, the fee of a bifhop, and refidence of a governor, with a capacious and fafe harbour. The number of inhabitants is reckoned about $1200 ; 20$ miles S . of Spalatro. N. lat. $43^{\circ} 5^{\prime}$. E. long. $16^{\circ} 50^{\prime}$--Alfo, a town of Naples, in Capitanata, the fee of a bilhop, fuffragan of Benevento, on a lake of the fame name communicating with the Adriatic; almolt totally deftroyed in 1627 by an earthquake; 26 miles N.W. of Manfredonia. N. lat. $41^{\circ} 59^{\prime}$. E. long. $14^{\circ} 30^{\prime}$.
LESKAU, a town of Bohemia, in the circle of Pilfen; 7 miles E. of Plau.

LESKEA, or Leskia, in Botany, an Hedwigian genus of moffes, named by its author in his Hift. Nat. Mufcorum Frondoforum, v. 2. 93, in memory of his friend Lefke, profeffor of Economy at Leipfic, and afterwards of Nat. Hilt. at Marburg, who died in 1786 , aged 35. This genus is by Britifh botanifts united to Hypnum, as agreeing therewith entirely in habit, and differing only in a very minute and uncertain character of the inner fringe, which is furnifhed with 16 fimple teeth, inftead of double or compound ones. See Fringe op Mosses, and Hypnumi.

LESKEN, in Geography, a town of Pruffia, in Pome. relia; 6 miles N.N.W. of Marienburg.

LESKIRCH, a town of Trantylvania; 14 miles W. of Fogaras.

LESKNITZ, or Lesnitz, a town of Silefia, in the principality of Oppeln; 18 miles S.E. of Oppelı. N. lat. $50^{\circ} 25^{\prime}$. E. long. $13^{\circ} 6^{\prime}$.

LESKO, a town of Auftrian Poland, in Gallicia; 48 miles $S$. of Lemberg.

LESKOVE'LZ, a town of European 'Turkey, in Bulgaria; $8+$ miles W.N.W. of Sophia.

LESLEY, Jonn, in Biograply, bihop of Rofs, of an eminent family in the northern part of Scotland, was born in 1527. He was educated at Aberdeen, and was prefented, in 1547, with a canonry in the cathedral of that city. Having obtained this preferment, he fpent fome years at the French univerfities, and took his degree of doctor of laws at Paris. In 1554, he returned to Scotland, and, taking, orders, was appointed official and vicar-general of the diocefe of Aberdeen. He took a moft active part againft the reformation, which was now taking root in Scotland; and appeared as a principal champion of the Roman Catholic party, in a difputation held between them and the reformers at Edinburgh, in 1560 . When the young queen Mary was invited to return and affume the reins of government, he was fent over by the Catholics to perfuade her to throw herfelf into the arms of the Popilh party. He embarked with her at Calais in 1561; and foon after her arrival was created one of the fenators of the college of juftice, and privy-counfellor. Shortly after this, he was nominated to the fee of Rofs. He did not confine his labours to the duties of the church, but was appointed by the queen to collect and revife the fubfifting laws of the realm; and the collection printed at Edinburgh in 1566, called the black acts of parliament, from being in the black letter, was the refult of its labours. When the unfortunate queen had taken refuge in England from the fury of the covenanters, and commiffioners were appointed by queen Elizabeth to examine the difpute between her and her fubjects, the bifhop of Rofs was one of thofe whom Mary chofe for the defence of her caufe. When reafoning and argument were found to be ineffectual, he joined in confpiracies, for her deliverance, which were dangerous to the perfon and government of Elizabeth. He urged the duke of Norfolk to thofe defigns which proved his ruin, and was himfelf involved in confiderable danger: he was taken into cuftody, his papers fearched, himfelf committed to the Tower, treated with the utmoft rigour, threatened with capital punifhment, and, after a long confinement, fet at liberty, on condition that he fhould leave the kingdom. He accordingly went into the Netherlands, and employed himfelf in the moft preffing folicitations to the kings of France and Spain, the German princes, and at length to the pope, in order to obtain Mary's liberation. He publifhed feveral books in her defence, and in vindication of her right and title to the crown of England. In 1579, he was appointed fuffragan and vicar-general of the archbifhopric of Rouen ; but on making his vifitation of the diocefe he was feized, imprifoned, and forced to purchafe his liberty by a high ranfom. In 1593, he was nominated to the bifhopric of Conftance. When there was no hope left him of returning to his own country, he retired to a monaftery near Bruffels, where he died in 1596 . He was a man of learning, an able ftatefman, and a faithful fervant and fubject of his lovereign: his principal works, as an author, are, r, his hifory, entitled "De origine, moribus, et rebus 'geftis Scotorum,'" in ten books: of thefe the laft three books are dedicated to the queen, to whom they were prefented in Englifh, before their publication in Latin: and, 2, a geographical work, entitled " Regionum et Infularum Vol. XX.

Scotix Defcriptio." Gen. Biog. Robertfon's Hilt. of Scotland.

LESLIE, Jonn, an Irifh prelate in the 17th century, was born in the north of Scotland, and received the early part of his education at Aberdeen. From this place he was fent to Oxford to complete his itudies. He afterwards vifited Spain, Italy, Germany, and France for farther improvement, and made a proficiency in polite literature, as well as in the abftrufe branches of lcarding. He was fo great a mafter of the Latin, that it was faid of him when in Spain "Solus Leflius Latine loquitur." He continued abroad twenty-two years, became converfant in courts, and procured the favour and friendfhip of many foreign priaces: and on his return he was honoured with the patronage of Charles I., who admitted him into his privy-council, in which he was continued by Charles II. after the refloration. In the church of Scotland he was preferred to the bifhopric of Orkney, and was tranflated, in 1633 , to Raphoe, in Ircland. Here he built a fately palace in the form of a caftle, which was found of great utility in the civil wars, as it fuftained 3 liege, with the bifhop as a kind of commander, who was, in fact, the laft perfon who maintained the Atruggle in defence of the royal caufe in thofe parts. After the reftoration, he was preferred to the bifhopric of Clogher. He died in 1671 , being upwards of an hundred years old, and having worn the mitre more than fifty years. He wrote many curious and very learned works, which he defigned for publication, but which were deftroyed, together with his valuable library and MSS., the fruits of many years collection, in the civil wars. Biog. Brit.

Leslie, Charles, fecond fon of the preceding, was educated in grammar-learning at Innifkilling, and, in 16064 was admitted a fellow commoner of Trinity-college, Dublin, where he took his degrees. Upon the death of his father he came over to England, and entered himfelf of the Temple, at London. He foon abandoned the ftudy of the law for that of theology, and was, in 1680, admitted into holy orders. In 1687, he was made chancellor of the cathedral church of the diocefe of Connor. About this time he made himfelf extremely obnoxious to the Popifh party in Ireland, by a zealous oppofition to their doctrines, and by an earnelt attachment to the Proteftant religion, which he endeavoured to propagate by every means in his power. The Papilts, encouraged by the reigning prince, James II., aimed at engroffing civil as well as fpiritual offices; and a high-fheriff of their party was appointed for the county of Monaghan. Mr. Leflie, as a magiftrate, and as converfant with the law of the land, was applied to with regard to the legality of the appointment: he inftantly decided that it would be as illegal for the people to permit the fheriff to act, as it would be in him to attempt it. The magiftrates, at the next quarter-feffions, inquired if the fheriffs were legally qualified, to which he replied, that " he was appointed by the king, and was of the king's religion." The anfwer to this was, that they boldly agreed to commit him for intrufion and a contempt of the court. Mr. Leflie, notwithftanding his attachment to the law of the land, had imbibed the doctrines of paffive obedience and non-reliftance, which fo warped his underftanding, that, at the revolution, he refufed to take the oaths to William and Mary. He was, in confequence of this conduct, deprived of his preferments ; and in 1689 withdrew with his family into England. Here he employed his pen in fupport of the caufe and the party which he embraced, and was eiteemed one of the ableft champions which the non-jurors had. He publifhed an anfwer to the "State of the Proteftants in Ireland, under the late King James's Government," by bifhop, afterwards
archbifhop, King. He publifhed a weckly paper, entitled "s The Rehearfal," confiting of dialogues on the affairs of the times: this was continued fix or feven ycars, when the papers were collected and publifhed together ; and it was faid by bifhop Burnet, that the fame thread-of the argument is purfued through them all, againft the liwfulnefs of refift. ance in any cafe whatever, deriving the fource of government wholly from God. Mr. Leflie wrote againft Deifts, Jews, Papilts, Socinians, and Quakers: all his writings he afterwards collected, excepting an illiberal piece againft the learned Tillotion, and publifhed in two volumes folio. The frequent vifits which he made to the continent, rendered him obnoxious to the Britifh government; and the hatred of him was much increafed by a piece, entitled "The hereditary Right of the Crown of England aflerted,'" of which he was the reputed author. He went to Bar-le-Duc to attempt the converfion of the fon of James II. to the Proteftant religion, in the hope that he might one day be fettled on the throne. Towards the clofe of queen Anne's reign, he took much pains in recommending him as her fucceffor, The attempt was made in vain; and after the rebellion of 1715, he retired with the young Pretender to Italy. In 1721, he made up his mind to return and die in his native country; and his friends implored the protection of government, which was granted. He died at his own houfe in Glaflough, in the county of Monaghan. He was unqueftionably a man of extenfive learning and great merit, and diftinguifhed by his piety, humility, and integrity. Biog. Brit.

LESNEVEN, in Geography, a town of France, in the department of Finifterre, and chief place of a canton, in the diftrict of Breft ; 13 miles N.E. of Breft. The place contains 2030, and the canton 16,024 inhabitants, on a territory of $167 \frac{\pi}{2}$ kiliometres, in 10 communes. N. lat. $4^{8^{\circ}} 34^{\prime}$. W. long. $4^{\circ} 14^{\prime}$.

LESNICA, a town of Lithuania, in the palatinate of Minfk ; 48 miles N.E. of Mink.

LESNIOW, a town of Poland, in Volhynia; is miles S. of Lucko.

LESNO, a town in the duchy of Warfaw; 35 miles S. of Pofen.

LESOANDELOR, a town of Afratic Turkey, in Caramania; 40 miles S.S.W. of Cogni.

LESPARRE, a town of France, and principal place of a diftrict, in the department of the Gironde; 11 miles N.N.W. of Bourdeaux. The place contains 800 , and the canton 15,247 inhabitants, on a territory of $542 \frac{1}{2}$ kiliometres, in 18 communes. N. lat. $45^{\circ} 19^{\prime}$. W. long. $0^{\circ} 50^{\prime}$.

LESPEDEZA, in Botany, to named by Michaux, in compliment to his friend and patron Lefpedez, governor of Florida, who was very favourable to his botanical expedition through that country, though it does not appear that the governor himfelf was a botanift. Michaux Boreali-Amer. v. 2. 70.-This genus differs from Hedyfarum, fee that article, in its legume, which is elliptical and turgid, fmooth, of one cell, with a folitary feed. The ftigma morenver is faid to be capitate and fomewhat conical.-The leaves are moftly ternate, rarely fimple.-It appears to be a good genus, and merits further examination, for its fpecies will probably be found rather numerous. Examples are $L$. feffiiifora, (Hedyfarum junceum; Walter Carolin. 184. Medicago virginica; Linn. Sp. Pl. 1096.) a native of Virginia and Carolina: and L. polyfachya, Michaux, t. 40, (Hedyfarum hirtum; Linn. Sp. Pl. 1055.), found in Carolina and Georgia. The habir is flender and fhrubby. Flowers fmall, purplifh, in longifh italked fpikes.
LESSANITZ, in Geography, a town of Bohemia, in the sircle of Kaurzim ; cight miles S.E. of Prague.

LESSAY, a town of France, in the department of the Channel, and chief place of a canton, in the diftrict of Coutances ; 11 miles $N$. of Coutances. The place contains 1503, and the canton 13,644 inhabitants, on a territory of 260 kiliometres, in 13 communes.

LESSEE, a law term employed in leafing land, to fignify the tenant. See Lease.

LESSEES, a term ufed by fportfmen for the dung of a wild boar.

LESSINES, in Gengraphy, a town of France, in the department of the Jemappe, and chief place of a canton, in the diftrict of Tournay; fituated on the river Dender, and celebrated for its linen manufacture ; 23 miles W.S.W. of Bruffels. The place contains 3037, and the canton 14,708 inhabitants, on a territory of 115 kiliometres, in 11 communes.

LESSING, Gotthold, Epiraim, in Biography, was born at Kamenz, in Pomerania, in 1729 . Having received the early part of his education partly at home, and partly at a boarding fchool, he was admitted, at the age of twelve, to the free-ichool of Meiffen, where he remained five years, and laid in a flock of Greek and Latin. Some odes of A nacreon, which he tranflated at this §chool, were afterwards publifhed in his works. His removal to the univerfity of Leiplic opened a new fcene to him; he paid little attention to the lectures of the profeffors, but ftudioufly fought out the company of the ftudents moft diftinguilhed for talents, and bold and fingular opinions. He became a frequenter of debating clubs, and was not furpaffed by any perfon in the focieties in the originality of his fentiments, and the acutenefs with which he defended them. After he had fpent three years at the univerfity, his father, who could ill bear the expence, urged him to take orders, or to purfue fome profeffion by which he might fupport himfelf. He declined this reafonable propofal, and fet about tranlating, and original compofitions for the ftage. After many changes, and much roaming about, he went to Gottenburg, where he took his degree of Mafter of Arts, with a view to a profefforfhip at Gottingen, but he ftill continued to find fupport by literary employment, which confilted in tranflations, compilations, and fome original pieces. He was a great proficient in the game of chefs, a circumftance that introduced him to the acquaintance of Mofes Mendelfohn; and the printer Nicolai made the third of a literary trio, who mutually fharpened each other's intellectual faculties, and influenced each other's opinions. Ramler the lyric poet, Sulzer the critic, and Suffimilch the flatiftic writer, were occafionally of their parties, and Germany perhaps could not then boaft of converfations more literary and colightened. In conjunction with Nicolai and Mendelfohn, he undertook a periodical work, entitled "The Library of Belles Lettres," which was a kind of review of works in polite literature, with original correfpondence. In 1760, he was elected a member of the Academy of Berlin, and foon after was appointed fecretary to general Tauenzier; his income at this period was confiderable, which he fpent liberally upon his relations and friends. His military affociates gave him a tafte for high play, which he found arguments to juftify. In 1762, he accompanied his general to the fiege of Schweidnitz; but after the peace, he was introduced to the king of Pruffia, and then refumed his literary occupations at Berlin. Though he produced many works, yet they were not the fource of much profit, and, in 1769 , his circumftances were fo narrow, that he was obliged to fell his library for fupport. At this critical juncture he met with a generous patron in Leopold, heir-apparent to the duke of Brunfivick, through whofe means he was appointed librarian at Wolfen.

## L E S

buttle. One of the fruits of this very defirable fituation was a periodical publication, entitled "Contributions to Literary Hifory," containing notices and extracts of the moft remarkable MSS. The "Contributions" were made the vehicle of "Fragments of an anonymous Writer difcovered in the Library at Wolfenbuttle," which confifted of direct attacks upon the Chriftian revelation. They occafioned a great commotion among the German theologians, and would not have been printed but for the interference of prince Leopold with the licencers of the prefs. In 1778 they were fuppreffed. Leffing, from his rifing fame, and connection with prince Leopold, with whom he went on a tour to Italy, was fo diftinguifhed among the German literati, that feveral potentates of that country made him offers of an advantageous fettlement. Nothing, however, would lead him to break his connection with his liberal patron the prince of Brunfwick, who, by his acceffion in 1780 to the fovercignty, was enabled to augment his favours towards him. His latter publications were "Nathan the Wife;" a fecond part of the fame drama, entitled "The Monk of Lebanon;" and " A Differtation on the Education of the Human Race." He died at Hamburgh in the month of February, 1781. Monthly Mag.

LESSOE, in Geography, an inland of Denmark, in the Scaggerac, nine miles long; and from one to four wide; within are fome fmall villages, and about it fome inets; about 12 miles from the coaft of Jutland. N. lat $57^{\circ} 17^{\prime}$. E. long. II $^{\circ}$.

Lessoe, a town of Norway, in the province of Aggerhuus; 145 miles N.N.W. of Chrittiania.

LESSON, in the Manege, is ufed for any piece of initruction in that art, whether given to the fcholar or the horfe.

Lessons, among Ecclefiafical Writers, portions of the holy fcripture, read in Chriftian churches, at the time of divine fervice.

In the ancient church, reading the fcriptures was one part of the fervice of the catechumens, at which all perfons were allowed to be prefert, in order to obtain inftruction.

The charch of England, in the choice of leffons, proceeds as follows; for the firt leffon on ordinary days, he directs, to begin at the begianing of the year with Genefis, and fo continue on, till the books of the Old Teftament are read over, only omitting the Chronicles, which are for the moft part the fame with the books of Samuel and Kings, and other particular chapters in other books, either becaufe they contain names of perfons, places, or other matters lefs profitable to ordinary readers.

The courfe of the firlt leffons for Sundays is regulated after a different manner. From Advent to Septuagefima Sunday, fome particular chapters of Ifaiah are appointed to be read, becauife that book contains the cleareft prophecies concerning Chritt. Upon Septuagefima Sunday Genefis is begun, becaufe that book, which treats of the fall of man, and the fevere judgment of God inflicted on the world for fin, beft fuits with a time of repentance and mortification. After Genefis, follow chapters out of the books of the Old Teftament, as they lie in order ; only on feftival Sundays, fuch as Eafter, Whitfunday, \&c. the particular hiftory relating to that day is appointed to be read; and on the Saints days, the church appoints leffons out of the moral books, fuch as Proverbs, Ecclefiaftes, Ecclefiafticus, \&c. as containing excellent initructions for the conduct of life,

As to the fecond leffons, the church obferves che fame courfe both on Sundays and week-days; reading the gofpels and Acts of the Apofles in the morning, and the epittles in the evening, in the order they fland in the New Tefta-
ment; excepting on faints days and holy dayz, when fuch leffons are appointed, as either explain the myftery, relate the hiftory, or apply the example to us.
Lessows for the Virginal, Spinet, and Ilarpfichord, have undergone great changes in the denomination and arrangement of their movements, from the time of queen Elizabeth to the prefent. In that princefs's virginal book, now in the poffeflion of vifcount Fitzwilliam, we find pavana in general to be the flow movement, and galliarda the quick. Now and then a fantafia, a coranto, and a gigg; but as fingle movements, not parts of a fuite of leffons. Praludium, or prelude, frequently occurs without leading to any other movement; as does paffamerzo, alman, toccata, once; but the reft are chiefly old tunes with variations. Thefe pieces are all written on a ftaff of fix lines.
Lady Nevil's Virginal Book.-This lady was a pupil of our admirable countryman Bird; and all the leflons in her book, a thick quarto, are of his compofition. They are admirably tranfcribed by John Baldwayne, a finging-man of Windfor, and a celebrated copyift of that time, 1591 .
Its contents are; "My lady Nevil's grounde, with eight variations. Qui paffe, four variations. March before the battle, 12 military movements. Old tunes varied. Groundes and fancies, with 18 pavans, and two leflons of voluntaire, all neatly written on four-ftaved paper of fix lines.
Thus far all our mufic for keyed-inftruments was in MS. But in the reign of James I the following book appeared in print, ftill on fix-lined paper. "Parthenia, or the Maydenhead of the firft Muficke that ever was printed for the Virginalls; compofed by three famous Mafters; William Byrde, Dr. John Bull, and Orlando Gibbons, Gentlemen of his Majefty's moft illuftrious Chapel. Dedicated to all the Mafters and Lovers of Mufick." "The pieces in this collection feem to follow in fuits, of which the firft is of Bird's compofition; as preludium, pavana, galliardo, all in G minor; then a prelude, and a galliardo in $\mathbf{C}$; and a pavan, and two galliardos in $\mathbf{G}$, by the fame.
The next author in the collection is mafter doctor Bull, whofe pieces are arranged in the following order, "A pavan and two galiards in A minor; prelude, pavan, and galiard, in G major ; two galiards in D minor." Orlando Gibbons' pieces have little connection, being a galliarda in C natural; a fantafia in four parts, in A minor; a pavan in do.; the queen's command in $\mathbf{C}$, and a preludium in G . This book was again engraved on copper in 1651 , fol.
The title of Handel's two fets of leffons is in French, and the movements of each fuit have the fame denominations as many French compofers of leffons had long ufed in Louis XIVth's time; as prelude, allemande, courante, gigue, with fometimes adagio, farabande, allegro, and air with doubles, or variations, which include all the technica of the firlt book.
In the fecond book, he has prelude, aria con variationi, minuet, chacone, and gavotta. The movements of the fecond book are of a lighter kind than thofe of the firf, as the firt and third fet of Corelli's fonatas are called "Suonate da Chiefa," and the fecond and fourth fets, "Suonate da Caméfa."

Scarlatti's leffons are almolt all fingle pieces, and we believe Alberti's were the firlt harpfichord leffons publifhed in England, that were called fonatas, "Suonate da Cimbalo," which, without accompaniments, is fill the general title of what ufed to be called leffons.

LESSOR, a legal term applied to the landlord, proprietor, or perfon who lets the land. See Lease.
LESTANO, in Ceography, a town of Italy, in the Friuli; 15 miles W: of Udina.

LESTI, a town of Sweden, in the government of Wafa; 54 miles E. of Jacobltadt.

LESTIBUDESIA, in Botany, named in honour of M. Leltiboudois, a French naturalilt. Aub. du Petit 'Ihouars, Plant. Ins. Afric. v. 1. 53. t. 16. Brown, Prodr. Nov. Holl. v. 1. $4^{13}$.

This genus is feparated from Celofia only on account of its ftigmas, which are three or four, flender and recurved, inftead of being capitate or two-lobed. It includes Celofia paniculata and trigyna of Linneus, with fome others, but Mr. Brown hints that it is probably not a natural genus, nor eftablifhed on fufficient grounds. His L. arborefcens, the only fpecies mentioned as found in New Holland, was gathered by fir Jofeph Banks in the Tropical part of that country. It has a !arubby twining Item; elliptic-oblong, fomewhat pointed, finooth leaves; terminal as well as axillary panicles; and three Itigmas, which, according to Dr. Solander's remarks, are deeply emarginate. The manner in which the fruit burfts has not been oblerved.

LESTIGUANO, in Geography, atown of Etruria; 27 miles W. of Volterra.

LESTOFF. See Lavestoff.
L'ESTR ANGE, Sir Roger, in Biozrapby, was a great lover of mulic, and a performer. His family, one of the molt ancient in Norfolk, were always great patrons of mulic, and mulicians. Jenkins was frequently an inmate at Hunfton, where, during the feventeenth century, when times were tranquil, profeffors and dilettanti frequently affembled to ling madrigals, and make ufe of feveral chelts of viols in the performance of fancies in fix parts, by the beft compofers of the times.

LESTRIGONS, in Ancient Geograply and Fabulous Hifory, inhabitants of Sicily towards the S.E., who are reprefented to have been a ferocious people. It is reportcd that they took Elpe, the daughter of Polyphemus the Cyclop, by force from Ulyffes, who had feized her and was running away with her, and returned her to her father. If we may credit the poets, both the Leftrigons and the Cyclops were real cannibals, who devoured fix of Ulyffes's companions. The learned Bochart will have the rife of this fable to be, that the Leftrigons were anciently called Leontini, a name derived from their barbarous and cruel manners; "à Leontinis moribus."

LESTWITHIAL, in Geography. See Lcestwithial.
LESZAISKO, a town of Aultrian Poland, in Galicia; 28 miles N.W. of Przemy 1 l.

LET-Fall, in Sea Language, the word of command for putting out a fail, when the yards are aloft, and the fail is to come down from the yard; but when the yards are flricken down, then the fail is loofed below, before they hoift the yard.

Let-fall is not properly faid of top-fails, becaufe they lie on the top; and therefore the word for them is, Heave out your top-fails. Nor can it be applied to the mizen; for the word is, Strike the mizen and fet it. So that in trietness the term let-fall belongs only to the main-fail, fure-fail, and fpritfail, when their yards are hoifted up aloft.

Let-in, in Ship Building, is the letting of one thing into another for fupport or fecurity, as the beams into the clamps, carlings into the beams, \&c. by fcores being cut to receive them.

LETAC, in Geography, a cape on the W. coaft of the ifland of Jerfey; fix miles N.W. of St. Aubin.

LETALA, a town of Sweden, in the government of Abo; 30 miles N.W. of Abo.

LETHAIS, a town of Mingrelia, on the Black fea; yo miles N. of Anarghia.

## L. E T'

LEIHAM, a town of Scotland, with a market, in the county of Fergus; five miles E. of Forfar.

LETHARGY, in Medicine, $\lambda n \theta \alpha \rho \gamma \sigma \rho, ~ \lambda \eta \theta \alpha \xi \gamma^{\prime} \alpha$, fignifying literally an indolent forgetfulnefs, (defidia obliviofa, from $\lambda r, \$$ n and xiygor, is commonly ufed to denote an inceflant and irrefiftible fleepinefs, accompanied by an impaired ftate of the memory, but without delirium.

The lethargy is, in fact, a minor degree of apoplexy, and originates from the fame caufes, and implies a fimilar ftate of preflure on the brain, the common centre of the nervous energy, as occafions that difeafe. Various denominations have been given to lethargic complaints, according to the difference of the degree of feverity, and fome nofologitts have treated of thefe varicties as diftinct fpecies of difeafe. Sauvages, for inftance, has three genera of fleepy affections, Letbargus, Cataphora, and Carus. The cataphora be defines, a fate of fomnolency, from which the patient may be eafily roufed, without fever, delirium, or lofs of memory : the lethargy, a foporofe ftate, from which the patient may be eafily roufed, accompanied with the greateft torpor of the memory and imagination, and with fever; and carus, a profound fopor without froring; for when the fnoring is prefent, he denominates it apoplexy. (See his Nofol. Method. Claifs iv. Ord. 5:) But it is obvious, as Dr. Cullen long ago obferved, that thefe various appellations and definitions defignate the fame difeafe, in different degrecs of feverity ; we may, therefore, refer to the article Aroplexy for a general view of the nature of the malady. We may obferve, at prefent, that it originates from fome compreffion upon the fubftance of the brain, by which its functions are impeded, and its influence on the fyitem at large, through the medium of the nerves, obitructed; that fuch compreffion may be occafioned by fractures of the fkull, when the fractured portion of the bone is depreffed inwards; from tumours within the head; from over-diftention of the blood-veffels of the brain; or from fluids effufed in or upon the brain ; but that the moft frequent of all thefe caufes of compreffion is a plethoric ftate, or an accumulation and congeftion of blood in the venous veffels of the head, operating, according to its degree, in producing over-dittention or effufion.

Lethargic complaints may, therefore, both precede and fucceed actual apoplexy, and are not unfrequently the forerunners of a fit. From this confideration, the importance of obviating their progrefs in the outfet, before a rupture of the veffels of the brain, or actual effufion, takes place, muft be obvious; for, however impracticable it may be to remove the fluids fo effufed, or to occalion their abforption, fo as to preferve the life of the patient, or to fave him from an incurable palfy, if hefurvive; yet, in the previous itate of mere plethora of the veffels of the brain, the proper remedies may be employed with every profpect of removing the lethargic fymptoms, and warding off the impend. ing danger. The plethora may be corrected by general evacuations by blood letting, if there is an imminent threatening of apoplexy; or by local evacuations by means of leeches, fcarification, and cupping, blifters, or iffues, where the danger is lefs imminent. At the fame time, the alvine excretions fhould be promoted by proper laxative medicines, the diet fhould be light, and rather fpare, and unftimulating, confilting of a large proportion of vegetable matter; and fermented liquors of all kinds fhould be very fparingly taken, or altogether difcarded. Exercife in the open air fhould be regularly perfifted in, and the hours appropriated to fleep fhortened, In a word, a lethargy is to be confidered as an impending apoplexy, or an apoplexy already begun, and to betreated accordingly. Sce Apoplexy.

LETHE, $\Delta i \theta n$, in the Anciont Mythology, one of the
rivers of hell，fignifying oblivion or forgetfulnefs；its wa－ ters．according to poetic fiction，having the peculiar quality of making thofe who drank them entirely forget every thing that was palt ；or，according to Virgil，＂longa potant ob．＂ livia vite．＂

Lethe．Letb，or Lathe，a meafure or portion of land， making one of the ancient divifions in England．

King Alfred divided England iato counties，as it ttands at prefent ；thofe counties he fubdivided into hundreds or tith－ ings．The hundred was a divilion，wherein were a hundred officers to fecure the peace；the lethe or lathe comprehended three or four of thefe hundreds．

Lethe was alfo the jurifdiction of a vifcount：or a kind of affize，held once a year in cach village，about Michael－ mas．Whether this was inflituted by Alfred，or not，is a queftion．

LETHERS，in Geography，a town of Hindooftan，in the circar of Sumbulpour； 16 miles W．N．W．of Sumbul－ pour．

LETHRABERG，or Ladreborg，a town of Den－ mark，in the ifland of Zealand；four miles S．W．of Roef． child．

LETHUM，in Ancient ATythology，was diftinguifhed by the Roman poets from mors，or death．See Petronius Arb． ver． 263.

Mr．Spence conjectures，that by Lethum they meant that general principle，or fource of mortality，which they fup－ pofed to have its proper refidence in hell；and by mors，or zwortes，the immediate caufe of each particular inftance of moriality on our earth．The poets give him a robe，but mention his arms being exerted out of it，as reaching at his prey：They hint at his catching people in a net，and his hunting them as they did beaits，within his toils．They re－ prefent Lethum as nearly related to Sleep；and Valerius Flaccus，in particular，acquaints us that they wese bro－ thers．Val．Flac．viii．ser．74．Spence＇s Polymetis，p．261． 263.

LETI，Gregory，in Biography，was born at Milan in 1630. He received his education at the Jefuits＇college at Cofenza， and afterwards paffed fome years in an unfettled ita $e$ e，manifert－ ing a ftrong repugnance to the ecclefialtical profeffion，which was propofed to him by his uncle the bifhop of Aquapen－ dente．Falling in company，at Genoa，with an officer of the Calviniltic perfuafion，he became a convert to the re－ formed religion，and openly arowed it at Laufanne．He went to Genera in 1660，married there，and fettled as a man of letters．His talents were held in fuch eltimation，that the right of citizenfhip was prefented to him gratuitoully； but his temper was fo farcaltic，as to involve him in great troubles，and in 1680 be retired to England．Here he was favourably received；a penfion was granted him，and he was promifed the office of hiftoriographer；but before he obtained it，he was ordered to quit the kingdom on account of fome freedom which he had exercifed in a work entitled＂Teatro Britannico．＂He went to Amfterdam，became acquainted with the celebrated Le Clerc，who married his daughter， and obtained the title of hiftoriographer of that city．Leti was a moft indultrious writer；his works are faid to amount to a hundred volumes．Molt of them are hittorical，but they are frequently deflitute of truth，and cannot be relied on unlefs fupported by other authority than the dictum of the writer．All his works are written in Italian，in a lively ftyle，but diffufe and void of talte．His beft productions are the lives of Sixtus $V$ ．；Charles V. ；queen Elizabeth； Philip II．；and Cromwell．He died fuddenly in the year 1701．
Letr，in Geograpby，a fmall inland in the Eaft Indian

Fea，near the idand of Timor．N．lat．8： $28^{\circ}$ ．E．lung． $127^{\circ} 15^{\prime}$ ．
LETLING，a town of Brandenburg，in the New Mark； five miles E．of Cultrin．

LETNA，a river of Ruffia，which runs into the Viatka， at Podrelikoi．
LETSCHKOM，or ODISEH，a town of Afiatic Turkey， and capital of Mingrelia；the refidence of the chief and fee of a Greek archbifhop ；$G o$ miles N．of Cotatis．

LETTER，or Letterbach，a town of Bavaria；is miles N．of Bamberg．
LETTER，Litera，a character either in print or writing， by which any people have agreed to exprefs one of the founds，ufed in convesing their thoughts to each other in fpeech．

Letter is by fome defined a fimple uncompounded found of the voice，that cannot be fubdivided into any more fimple， and generally marked with a particular character．
But it mult be owned that，Atrictly fpeaking，a letter is not the found itfelf，but rather the fign of a Yound；for $\gamma_{i} x_{\mu} \mu \nu$ ，
 litera is formed from litus，the particip＇e of linere，to fmear，or mark；whence obliterare fignifies ta blot out．

Where a lign or character does not exprefs a found en－ tirely fimple，but one refolvable into feveral，it is not fo properly a letter as an abbreviation，containing in itfelf as many letters as its power does fimple founds．This is evident in the Latin $\mathcal{E}, x$ ，and the Greek $\xi, \dot{\psi}, 5, \hat{\alpha}$ c．which are compofed of $e, t, k, s, v \sigma, \pi \tau, \sigma, S \mathrm{SC}$ ．

On the contrary，a fimple found，though expreifed by feveral characters，is yet to be efteemed one letter；for $t h$ ， $p h$ ，are fingle letters；as much as $\phi, \theta$ ，and $f$ ．

The letters，$f, g, b, k, q, x, y, z$ ，were unknown to the anctent Romans，as is proved by Daufquius in his Orthogra－ phy，where he traces the origin of the feveral letters．See $\mathrm{F}, \mathrm{G}, \mathrm{H}$, \＆c．
Grammarians diftinguifh letters into vozuels and confonants ； into mutes，dipbthongs，liquids，and cbaralerifics．See each of thefe terms refpectively．
The Hebrews divide their letters into guttural，as $a, b, c b$ ， $g n$ ，aleph，he，cheth，hain，expreffed by yño；dental， as $z, s, t s, r, s b$ ，zain，famech，tfade，refch，fchin，ex－ preffed by $\cup$ ？ phe，exprefled by the word 7 Ian ；lingual，or thofe chiefly formed by the tongue，as $d, t, l, n, t h$ ，daleth，teth，lamed， nun，thau，expreffed by תגל：ר－；and palatal，as $g, i, c, k$ ， ghimel，jod，caph，koph，expreffed by P⿳亠丷厂⿰㇒⿻コ一⿰⿷匚一亅⿱一𧰨刂灬．
Printers diftinguifh their letters into capital，majufcule， initial，or upper－cafe letters，which ferve for the titles of books，proper names，scc．；and minufcule，fmall，or under－ cafe letters；which are again divided，according to their fize，into pearl，nonparcil，pica，greatprimer，cannon，\＆c．
They have allo their flourihed letters，engraven on wood or metal，which take place of the illumined letters of the an－ cient manufcripts．

There are letters of various fizes，or bodies；each of which，again，are fometimes calt with the Roman，fometimes an Italic，and fometimes an Englifh，or Black letter face． There are alfo bodies with Greek，Hebrew，Arabic，the mulic face，\＆c．

Letters make the firlt parts or elements of grammar，con－ ftitutiag the fubject of crtbograpply；an affemblage of thefe compofes fyllables，of thofe zuards，and of thefe fentences． See each under their titles．

## LETTER.

The alphabet of every language confifts of a cextain number of thefe letters, which ought to have a different found, figure, and fignification. See Alpifabet.

As the difference of articulate founds was intended to exprefs the different ideas of the mind, fo one letter was originally intended to fignify only one found, and not, as at prefent, to exprefs fometimes one found, and fometimes another: which practice has brought a great deal of confufion into the languares, and rendered the learning of the modern tongues infinitely more difficult than it would otherwife have been. This confideration, together with the poverty of all the known alphabets, and their want of fome letters to exprefs certain founds by, has occafioned feveral attempts towards an univerfal alphabet, to contain one enumeration of all fuch fingle founds or letters as are ufed in any language. A thing of very confiderable ufe; a fpecimen of which is given us by Mr. Lodwick, in the Philofophical Tranfactions. See Univerfal Cilaracter.

According to Crinitus, Mofes invented the Hebrew letters; Abraham the Syriac and Chaldee; the Pheenicians thofe of Attica, brought into Greece by Cadmus, and thence by the Pelafgians into Italy ; Nicoftrata the Latin; Ifis the Egyptian: and Ulphilas, about three hundred and feventy years after our Saviour, thofe of the Goths. Yet as to the firlt letters, what they were, who firlt invented them, and among what people they were firft in ufe, there is ftill room to doubt; however, fetting afide conjectures and prejudice, the bufinefs of antiquity feems to lie between the Egyptians and Chinefe. Philo attributes the firft invention of letters to Abraham; Jofephus, St. Irenxus, and others, to Enoch; Bibliander, to Adam; Eufebius, Clement Alexandrinus, Corn. Agrippa, \&c. to Mofes; Pomponius Mela, Herodian, Rufus Feftus, Pliny, Lucan, \&c. to the Phoenicians; St. Cyprian, to Saturn; Tacitus to the Egyptians ; and fome to the Ethiopians.

The Egyptian mummies and obelifks prove a great antiquity on the fide of the hieroglyphics; but if the Chinefe chronology may be credited, their characters are much more ancient than thofe of the Egyptians. The Chinefe make Fohi, the firlt of their kings, fuppofed by many learned and judicious writers to have been no other than the patriarch Noah, the inventor of their letters, and compute him to have lived two thoufand nine hundred and fifty years before Chrift, during all which time they pretend to have certain and written accounts in their books. If this holds true, their character mult be older than Mofes by fourteen hundred years, and even prior to Menes, the firft king of Egypt, by five hundred years; fo that the Chinefe letters appear to be the molt ancient of that kind; and the book Yekim, faid to be written by Fohi, the molt ancient book.

But as China is fo remote, and had fo little communication with thefe parts of the world, we may reafonably make another enquiry into the original of letters in the hither parts of Afia, Egypt, and Europe. Here, indeed, the Egyptians feem to have the belt title. It is more than probable, from the obelifks, \&cc. that their hieroglyphics were the firlt manner of writing, and the original characters in thefe parts, as being prior to Mofes; and were made, at leaft in great meafure, while the Ifraelites were flaves among them, and confequently not well qualified for inventions fo very curions and judicious.

To this fource the learned bifhop Warburton afcribes the origin of alphabetical writing among the Egyptians: for as philofophy advanced, and their learned men wrote much, the exact delineation of hieroglyphic figures became too tedious and too voluminous; and they, therefore, by degrees
perfected another character, which he calls the running hand of hieroglyphics, refembling the Chinefe charaters, which being at firtt formed only by the outlines of each figure, became at length a kind of marks. See Hieroglyphics.

This running character was denominated by the ancients bieroglyphical, and led to the compendious ufe of letters by an alphaber, which method of writing, as the ancients inform us, was invented by the fecretary of an Egyptian king, and firlt ufed for fecrecy in the conveyance of letters of ftate, whence it was called cpiftolary writing: but afterwards letters became common, and, as he obferves, hieroglyphics fecret and myfterious. This political alphabet, he adds, foon occafioned the invention of a facred one, ufed by the prietts, and called bierogrammatical. But the precife time of the inverition of Egyptian letters cannot be fo much as guefled at, becaufe hieroglyphics continued in ufe long after letters had been found out: it is certain that they were very early, becaufe the invention of them was afcribed to their gods. Bilhop Warburton farther conjectures, that Mofes brought letters with the relt of his learning from Egypt, and that he both enlarged the alphabet, becaufe the Hebrew alphabet which he employed in the compofition of the Pentateuch is confiderably fuller than that which Cadmus brought into Greece; and altered the fhapes of the letters, reducing them into fomething like thofe fimple forms in which we now find them, in order to prevent the abufe to which they would be liable as hieroglyphic marks and fymbolic images. He argues, that, confidering the importance of letters among the Hebrews, with regard to the integrity of their religion, if God had been the immediate author of them, Mofes would have recorded the hiftory of their in vention, as the beft fanction to their ufe and beft fecurity from the danger of hieroglyphic writing, to which this people, fo fond of Egyptian manners, were very powerfully inclined. Divine Legation, vol. ii. p. I. 124, \&c. See alfo on this fubject Sharpe's Origin of Languages, P. 56, \&c.

Many of the fathers, and fome learned men among the moderns, have imagined that the knowledge of alphabetic writing was either fupernaturally imparted to our firft parents, or difcovered very foon after the Creation by the effort of their own powers. Others have fuppofed that alphabetical letters were introduced very early after the deluge, about the time of the difperfion of mankind, to which period the records of the Chaldean aftronomy very nearly extend. Mr. Shuckford, who fuppofes that they were invented both in Affyria and Egypt, conjectures that the great project of Babel, next to the building of the tower, was the improvement of language, by diffolving the monofyllables, of which the firft language of mankind confifted, into words of various lengths, in order to obtain new fets of names for new things; and that a project of this kind might gradually lead to the invention of alphabetical letters. Con, of Sacred and Prof. Hift. vol. I. P. 248.
But to thefe conjectures it may be replied, that we have no authentic relation of any alphabetic character before the flood; the account of the infcription upon pillars by the firt Mercury from Manetho, or of Seth mentioned by Jofephus, being too fabulous to deferve credit. Be. fides, if they had been in ufe among the patriarchs after the deluge, many occafions occur, in which they would not have been omitted: and aspwe have no account of the ufe of alphabetic characters in epiftles or contracts, or for other purpofes to which they would naturally be applied, we may infer that they were not known. T'o which we may add, that none of the revelations of God to the patriarchs, were enjoined to be recorded till the giving of the law. Others have afcribed the invention of letters to the

Arabs,
＇Arabs，before the time of Mofes；but when we confider the rudenefs of their lives and manners，this opinion is by no means probable：and，therefore，the greater number of writers among Jews and Chriltians，both ancient and modern， have contented themfelves with tracing their origin to Mofes， fuppofed to be the fame with the Egyptian Thoth or Hermes，mentioned in the hiflory of that nation ；alleging that God taught him the uie of alphabetic letters，in the exemplar of the two tables，written，as the text affures us， with the finger of God；which words can be underitood to mean only that they were written by a divine order and direc－ tion，as is evident by comparing Exod．xxxiv．2\％，28．and ch．x．4．It has been faid by fome of the advocates of this opinion，that the elements of language were thus fuperna． turally revealed to Mofes upon the firft arrival of the If－ raelites before Horeb，but that their characters，with the arriangement of them，might be left to his difcretion．But it feems more probable，that letters were at this time well known to the Irraelites，as God thought fit to deliver the firt elements of their religion in that kind of writing：more efpecially as the hiftory of fo momentous a circumitance is not recorded；a circumftance，the memory of which would have been one of the greateft barricrs againft idolatry．From the Ifraelites，it is fuppofed this art of alphabetical writing paffed to the Syrians，and from them it was communicated to the Phonicians and Egyp－ tians：though it feems probable that it was of a more an． cient date among the latter than the time of the decalogue， or the delivery of the law on mount Sinai．

Sir Ifaac Newton，in his Chronology，allows the Midian－ ites，fprung from Abraham by his concubine Keturah，to have inftructed Mofes in the knowledge of writing．

Neverthelefs，whether Cadmus and the Phoenicians learnt letters from the Egyptians，or from their nearer neighbours of Judea and Samaria，is a queftion；fince fome of the books of the Old Teftament，being written in letters，is more likely to have given them the hint，than the hieroglyphics of Egypt．But when or wherefoever the Phoenicians learnt this art，it is generally agreed，that Cadmus，the fon of Agenor，firft brought letters to Greece；whence，in the following ages，they fpread over the reft of Europe．

Herodotus，in his fifth book intitled Terpfichore，informs iss，that thofe Phoenicians who accompanied Cadmus into Greece，and fettled there，among many other arts and fci－ ences，introduced into that country the knowledge of letters， which the Greeks，in his opinion，were ignorant of till that time：their firit letters were fuch as were in ufe among the Phornicians；but fome time after they altered them a little， both with regard to their make and found ；which alteration fome have fuppofed to have been the change of the Hebrew charaEters into thofe that were afterwards called the Sama－ ritan ；and as at that time many of the neighbouring parts were inhabited by fuch as were originally Ionians，who alfo had received their letters from the Phœsicians，they mixed the one with the other；and hence thofe characters were termed Phœenician，becaufe they were brought out of Phæ－ nicia into Grecce．Herodotus alfo adds，that he faw at Thebes，in Bootia，in the temple of Ifmenian Apollo，three tripods，that had inferiptions upon them in Cadmean let－ ters，which very much refembled the Ionic．The time of this expedition of Cadmus into Greece，is fixed by fir Ifaac Newton to about the 1045 th year before Chrift．The num－ ber of letters which Cadmus brought into Greece，accord－ ing to Arillotle，as cited by Pliny，was eighteen；but ac－ cording to Plutarch and Pliny himfelf，fixteen；to which Palamedes，in the time of the Trojan war，added four，and Simonides four；fo that the Greek alphabet was gradually
perfected．The altcrations and improvements introduced into Greece have led fome writers to afcribe the invention of the alphabet to the Greeks：thus，Voffus de Arte Gram．lib．i．cap．10．afferts，that Cecrops，who was much older than Cadmus，was the firft author of the Greek let－ ters；and others afcribe them to Lincus，or to Palamedes． （Diod．Sic．lib．iii．＇Tacitus，lib．xi．cap．14．）But the more general opinion of the ancient writers is that they were derived from the Phœenicians and Egyptians．Dio－ dorus（lib．v．）fays exprefsly，that they were invented by the Syrians，and communicated by them to the Phœ⿱㇒日勺心㇒icians，who changed the form of the characters brought into Europe by Cadmus．Pliny，（Nat．Hilt．lib．vii．cap．56．）fays，that he is of opinion，that they were Affyrian，though he acknow－ ledges that others thought they were invented by the Egyp－ tians，and that Mercury was their firlt author．Diodorus， （lib．ii．）afcribes the invention of them to the fame perfon；and likewife Plutarch Sympof．lib．xx．cap．3．and Cicero de Natura Deorum，lib．iii．And the era of this invention is com－ puted by chronologers to be as early as the year of the world 2054 ，and before the incarnation 1950 years．The Greeks retained the names and orders of feveral of the oriental or Cadmean letters，though they altered the form of them； and there are feven letters，viz． $\mathrm{T}, \Delta, \mathrm{H}, \mathrm{K}, \Lambda, \mathrm{P}, \mathrm{T}$ ，whofe original figures were retained by the Grecks with little va－ riation．As to the Latins，all writers agree，that they received their letters from the Greeks，being firlt taught the ufe of them by fome of the followers of Pelaigus，who came into Italy about 150 years after Cadmus came into Greece；or by the Arcadians，whom Evander led into thefe parts about 60 years after Pelafgus．Pliny（iib．vii．cap． 56 ） and Solinus imagined the Pelafgi to have been the firft authors of the Latin letters；but Tacitus（lib．xi．p．131．） was of opinion，that the firft Italians were taught letters by the Arcadians；and Dionyfus Halicarnaffus（lib．iii．）ex－ prefsly affirms the fame thing．That the Latin letters were derived from the Greek feems very probable from the fimi－ litude which the ancient letters of each nation bore to one another．Tacitus（Annal．lib．xi．）obferves，that the fhape of the Latin letters refembled that of the moft ancient Greek ones；and the fame obfervation was made by Pliny， lib．vii．cap．58．and confirmed from an ancient table of brafs infcribed to Minerva．Scaliger Digreff．ad Arnum Eufeb． 1617，and Voffus，lib．i．cap．24，25，have adopted and fup－ ported the fame opinions．See thole citations in Shuckford＇s Conn．vol．i．p．223，\＆c．
Thus we find，that Greece was the centre from which the rays of fcience fhot into the weftern world；and the barbarous nations which penetrated into Italy towards the clofe of the Roman empire，carried arts and learning back into the North；or the knowledge of letters might be in－ troduced among the northern nations from the borders of Afra，in an earlier age．（Sharpe＇s original Powers of Let． ters．Obfervations on Alphabetical Writing，1772．）Rud－ becks，who，in his Atlantica，claims the glory of all in－ ventions，from all other rations，for the Swedes，maintains， that the Ionians had letters before Cadmus；that at the time of the liege of Troy，the Greeks had but fixteen letters，whereas the Phonicians had twenty－two ；whence he concludes，that it was not either Cadmus，or the Phoeni－ cians，who taught this art to the Greeks．But，becaufe the arcient northern nations had juft fixteen letters，like the Greeks，he concludes the Greeks muft either have taught them to the people of the North，or have learnt them of them．But becaufe the form and make of the Runic let－ ters is mere artlefs and coarfe than that of the Greek letters， he concludes，that thefe laft muft be derived from the former；
1.3ing it as a principle, that thofe who derive any thing from another. polifh and improve it. He even afferts, that by the goiden apples, which Hercules was obliged to fteal, want be underftood the letters in ufe among the Hyperboreans.

There are few things on which there has been fo much written as on the original Hebrew letters. Origen, Eufebius Cæfarienfis, St. Jerom, \&ec. have made it the fubjeEt of their enquiry. See Hebrew and Samaritan.

The art of joining letters to form words, and of combining the one and the other an infinite number of different ways, is a fecret unknown to the Chinefe. Intlead of the alphabetical letters, they at firf, like the Egyptians, ufed hieroglyphics; they painted, rather than wrote; ftriving, by the natural images of things drawn on paper, to exprefs and communicate their ideas to one another.

To remedy the inconveniences of this method, they ehanged, by little and little, their manner of writing, making it more fimple, though lefs natural. They even invented feveral characters, to exprefs things that did not come within the reach of painting to reprefent: as voice, fmell, thoughts, paffions, and a thoufand other objects that have no body or figure. From feveral fimple ftrokes they afterwards framed others more compound; and in this manner multiplied the letters and characters to infinity, contriving one, or more, for every word.

This multitude of letters feems the fource of that ignorance which we find among the Chinefe; their whole lives being fpent in learning their letters, they have no time to apply themfelves to the ftudy of things, but think themfelves very learned when they are able to read. There are fcarcely any of them that know all their letters; they think it is a great progrefs they have made, when, after forty or fifty years hard itudy, they are able to underftand fifteen or twenty thoufand. But the generality of their learned men come fhort of this. Father Le Compte is of opinion, that the greatef doctor among them never underftood half of their letters well; for the whole number he reckons eighty thoufand. 'This is a prodigious inconvenience to foreigners, of which the miflionaries in that country make loud complaints.

Among the Chinefe letters, there are fome now almoft worn out of ufe, and only preferved out of refpect to antiquity. There is a fecond clafs, much lefs ancient than the former, only ufed in public infcriptions. A third, much more regular and beautiful, ufed in printing, and even in ordinary writing. However, as the ftrokes are to be diftinctly formed, they cannot be written with any expedition. For this reafon, they have invented a fourth kind, where the ftrokes, being clofer, and lef8 diftant from each other, allow them to be written with more eafe and readinefs; and this they call the ranning letter. See Chinese Tongue.
The Americans had no letters before the difcovery of that country by the Spaniards. The Acaanibas engrave their memorable events and epochs on flones and metals; their fongs fupply the reft. In Peru and Chili, to keep an account of their goods and chattels, and to preferve the memory of their particular affairs, the Indians have recourfe to certain knots of wool; which, by the variety of their colours and ties, ferve intead of characters, and writing. The knowledge of thefe knots, which they call quipos, is one of their great fciences; but which is always kept as a fecret, and never revealed to the children, till the fathers think themfelves at the end of their days. Sec on the fubject of this article Langeage, Grammar, and Writing.

Letters, or Literal Notation, in Mufic. The Greeks
ufed all the twenty-four letters of their alphabet as mufical characters; and thefe not fufficing for all their modes and genera in their natural flate, were fometimes ufed as capitals, fometimes fmall ; fome entire, fome mutilated ; fome doubled, and fome inverted; to the amount of 1620 notes. See Alysius, and Notation.

## Lettre, Dominical. See Dominical.

Letter, Double. See Double.
Letter, Final. See Final.
Letter, Gutural. See Guttural.
Letter Foundery, See Foundehy.
Letter Founders' Furnace. See Furnace.
Letter Founders' Mould. Sce Mould.
Letter, Labial. See Labial.
Letters, Numeral, are thofe ufed, inftead of ciphers, to exprefs numbers.

The Roman numerals are, C, D, I, L, M, V, X ; whick are all formed by defcribing a circle, and drawing two lines through it, croffing each other at right angles in the centre. Soe Character.

Letter, Nundinal. See Nundinal.
Letter is alfo a writing addreffed and fent to one. See Epistle.

By. 9 Geo. I. cap. 22. amended by ${ }_{7} 7 \mathrm{Geo}$. II. cap. 15 . knowingly to fend any letter without name, or with a fictitious name, demanding money, \&cc, or threatening, without any demand, to kill or fire the houfe of any perfon, is made felony without benefit of clergy. And by 30 Geo. II. cap. 24. perfons fending letters with or without a name, or with a fictitious name, threatening to accufe any one of a crime punifhable by law with death, tranfportation, pillory, or any other infamous punifhment, in order to extort money or goods, fhall be punifhed at the difcretion of the court by fine and imprifonment, pillory, whipping, or tranfportation for feven years.

Letters of abfolution were formerly granted by an abbot, to releafe any of his brethren from the obligation of fubjection and obedience, and to make them capable of entering into any other religious order.

Letter of attorney, in Law, a writing authorizing an attorney to do fome legal act in our flead: as, to give feifin of lands, to receive debts, to fue a third perfon, \&c. And letters of attorney are either general or fpecizl. Weft. Symb. par. I. ftat. $7^{\circ}$ R. II. cap. I3.

The nature of this influment is to give the attorney the full power and authority of the maker, to accomplifh the act intended to be performed. Sometimes thefe writings are revocable, and fometimes not fo; but when they are revocable, it is ufually a bare authority only ; and they are irrevocable, when debts, \&c. are affigned to another; in which cafe the word irrevocable is inferted.

Letters claus, or clofe, are oppofed to letters patenf. See Close Rolls.

Letter of credit, among Merchants. See Credit.
Letters communicatory. See Literde communicatoric.
Letter of exchange. See Bill and Eychange.
Letter of licince, in Trade, an inftrument or writing granted to a man who has failed, or broke, figned and fealed by his creditors; which letter ufually gives a longer time for payment: fo that the debtor, having fuch an affurance, may go about his bufinefs, without fearing an arreit.
Letters of mart, or marque, are letters under the privy feal, granted to the king's fubjects; impowering them to take, by force of arms, what was formerly taken from them by the fubjects of fome other ftate, contrary to the law of mart. Letters of marque, in the Britifh dominions, are to
he granted by the admiralty; and they cmpower the commander of a merchant fhip or privateer to cruife ayaint and make prizes of the enemies fluips and veffels, either at fea, or in their harbours. See Marques.
Letrer mifirue, in the Elefion of a Bijbop. Sce Bishor.
Lemtern mijifue, in Chancory. If a peer is defendant in this court the lord chancellor lends a letter mifitive to him, to requelt his appcarance, together with the copy of the lill: if he neglects to appear, then he may be ferved with a fubpena; if he continues ftill in contempt, a fequeftration i inues out iumnediately againft his lands and goods, without any of the meffice procefs of attachments, \&c. which are directed only ayaint the perfon, and therefore cannot affect a lord of partiament. The fame procefs iffues againft a member of the hourf of cormmns, except that the lord chancellor doss not fend hima any letter mififive.
Lertens patent, or overt, are writings fealed with the great-feal of England, whereby a man is authorized to do or enjoy any thing, which of himfelf he could not do. They are fo called, on account of their form ; as being open with the feal afired, ready to be flewn for the confirmation of the authority ziven by them ; and ufually directed or addreffed by the king to all lus fubjects at large, thus, and in fome other refpects, differing from clofe leterers. See Close Rolls.
Common perfons may grant letters patent : but they are rather called patents, than letters patent: yet for diitinction, thofe granted by the king, are fonietimes called letters patent royal.
Letters patent conclude with tofle meiffo: charters with biis tefiliur. See Patest.
Letrens of refpite, letters iffued out by a prince, in favour of honeft unfortunate debtors, againit too rigorons creditors, whereby payment is delayed for a certain term.

The ufe of thefe letters is very ancient. Caffidorus obferves, they were in ufe in the time of Thicodoric, king of the Goths; others will have them introduced towards the end of the eleventh century, by pope Urban II. in favour of thofe who went on the croifades.
They are fill in ufe in France and fome other countries, and take their name, à refpirando, becaufe they give the debtor a breathing time.
St. Louis granted three years refpita to all who made the voyage of the Holy Land with him.
Letters circular, dimilorry, frank, monitors, pacifc, paf. chal. Sce the feveral adjectives.

Letters of fafecconduc. See Safe-conduc.
Lettere, in Geograpby, a town of Naples, in Prin. cipato Citra, the fee of a bithop, fuffragan of Amali; ; 12 mies W.N.W. of Salerno. N. lat. $40^{\circ} 43^{\prime}$. E. long. $14^{\circ}$ $20^{\prime}$.

## lettered, Letrados. See Literati.

Letterkenny, in Georreppby, a towninip of America, in Franklin county, Penniylvania; containing 1497 inlabitants.
Lettenkenny, a pont-town of the county of Donegal, Ireland, fituated on the river Swilly, over which it has a bridge. It is Irg miles N.W. from Dublin.

LETTERN, from Ledrimum, the reading defk in ancient churches, \&cc., from which the epiltles and gofpels of the liturgy were read. Thie defss for the former frequently reprefented the prophet Mofes with his horned countenance, thofe for the latter an eagle, the well-known emblem of St. John the Evangeliit.

LETTES, a people of Ruffia, derived from the Slavi and evincing a near affnity with the Vendi. Originally they were one people with the Lithuanians; as is evident from Vol. XX.

## I. E T

the identity of their language and even of their names. In the midalle ages the following denominations are ufed withan out dittinction ; viz. Letthnia, Letthovia, Lithavia, Litfonia, Lottavi, Litthvini, Letthovini, Ictithvani, Letzonce, \&ic. Probably, fays Tooke, the Lettes ubtained their particular name from their firt hometlead. In the circle of Valk. not far from the town of Vendra, a river named Lecta takes its rife; this river is called in Lettifh "ta Latte," and a Latte is in their languare Latvis, a man living by t! river Latte. 'I'll towards the end of the twelfth centut: Lisonia or Lettland was entirely unknown to the Germe: hititorians; it is mentioned only by Danes, Swedes, and Ruflians. Dy the two former on occalion of their piracie: and by the Rufitans for denoting their dominion cover that country. Athough Neftor, the oidelt and moit authemtic Ruffian amalift, does not exprefsly mention the Leiter; this may poflibly be owing to their not being at that time a particular nation diftinct from the lithuanianso It appears unqueftionable from many teftimona:s, that the diftrict inhabited by the Lettes on the Latic already belonged to Rufita in the earliest periods of its monarchy; it nesertheleis appears that Livonia had then no fettled conititution, nor was bound to the parmet date by any firm political tie. (See Livonht.) 'ithe homellead of the Lettes is not the whole of Livonia, but only a part of it which is called Leteland, confiling of four of the nine diftricts or circles into which Livonia, or the prefent viccroyalty of Riga, is divided; the remaining five circles being inhabited by Etthonians. Befides, the Krures in Couriand, Semigallia, and the bilhopric of Pilten are true Lettes; by whom, in part, the Lettifh language is fpoken in the greateit purity; and thefe people are moftly degenerated in Polifi Livonia, where they are mized with Poles and Rufo fians. The number of them at prefent cannot be properly afcertained; but in the vice-royalty of Riga alone, there were upwards of 226,000 Lettes, according to the batt cenfus. At prefent they are no longer known as a feparate people; they were mingled by imperceptible degrees, and at lait blended with the Lettes, the Efthes, and the Coures, as they are ufually called, the Lettonians, the Efthoniars, and Courlanders. The Lettes, or Lettonians, are reprefented as a people always peaceable, induitrious, hof pitable, frugal, and of a fomewhat better difpolition than the Efthonians; and they inhabited the greater part of the Venden ditrict, and extended themfelves cuen into Dorpat, and hence it is that the chronicles mention the Lettes in Ungannia. Their origin has been at one time fought for among the Grecian, and at other times among the Sarmatian tribes. By their language, however, it is perceived, that they bear an affnity with the Courlanders, or Coures, and that they are properly of Lithuanian, or in general of Slavonian origin. At prefent they occupy two ditricts, which botk together are after them called Lettland. By the augmentation which they received from the Liefs, now reckoned with the Lettes, the Vendes, the Lettgallians, and the Ethonians, they are more numerous than thoy were in the twelfth century. The Lettes call themfelves Latwertis.

Both Efthonians and Lettonians, admitting many exceptions, are addicted to intemperance. Without beer and brandy they have no conception of pleafure. 'The arged in particular are hard drinkers, and contimally fmoke tobacco. They derive alfo a great part of their pleafure from fanging and mulic. At their work in the fielh, as well as at thenr play, the girls are always finging. The moit ufual inftrument with both nations is the bag-pipe, made by themfcives, and founded in proper time, in two keys, with great dexterity. The miferable horizontal harp, and the fiddle,
which

## l ET

## L E V

which the Lettes are very fond of at all their feflivals, were firt introduced among thera by the Germans. They are alfo very fond of dancing. Among their favourite fummer paitimes is the fwing; and this diverfion, for which there is ascommodation in every village at every houfe of entertain. ment, is in high vogue in Eafter. In hot weather fwimming is much practifed by perfons of all ages and fexes; and the boors without exception are paffionately ford of fcalding hot-baths. Infidelity towards their malters, diftruft, a difpofition to cheat and fleal, and fuch like, are the vices to which they are addited, and they certainly take their rife from the flavery in which they are held. They rarely rob one another; but they are very ingenious in devifing means to impofe upon their malters. Againtt them they have frequently rifen in rebellion. Lying, curfing, and fwearing are very current among them. Of their religion we thall only fay, that when they were heathens, they were inuch given to fupertition. Their paganifm, it is faid, was very fimilar to that of the Celts and ancient Germans. They Jad no temples, and acknowledged only one God, whom they adored under various names. They performed their religious rites in the open fields, on the top of a mountain, near a lipring, or under the fhade of a tree; and reckoned thefe places facred. They believed in inferior deities, to whofe care and government certain regions were allotted, and whom they much feared to offend. They had a god Thou, to whofe infiuence they afcribed all aerial phenomena. Of the places and groves, where the ancient Lieflanders, as well Elthonians as Lettonians, were accuftomed to perform the holy rites of paganifm, many, notwithftanding the ftrict orders that have been iffued for their demolition, ftill remain, and they teflify towards them an awful reverence. Offerings of wood, wax, yarn, bread, \&c. are ftill in ufe among them, by laying them on the holy places, or cramming them in the hollows of aged trecs. Springs and rivers likewife have their thares of thefe unbloody facrifices. At their fecret idolatrous affemblies, the keeping up of the fire, into which they throw all forts of offerings, is ftill a principal obfervance. In Liefland they had idols, but no proper idol temples. The religious rites of the Celts and Lieflanders feem very much to refemble one another. Among both the Lettes and the Eithes many remains of heathenilm are fill oblervable; although in the twelfth century the Liefs, and afterwards the Lettes, were brought to the profeffion of Chriltianity by the Germans; and a part of the Ethes by the Danes. 'Tooke's View, \&ic. vol. i.

LETTING Farms, in Rural Economy, the practice of providing proper tenants for them, which is a bufinefs effected by different methods in different diftricts, as by prirate agreements, by propofals, and by public auction, to the highelt bidder; all of which are liable to objections in fome degree, but the firlt of thefe modes probably the leart of any. See Farm.

LETTONIA, in Geograpby, a province of Ruffia, now included in the government of Riga. See Letres, Livonia, and Riga.

LETTOWITZ, a town of Moravia, in the circle of Brunn; 20 miles N.N.W. of Brumn.

LET'TUCE, in Botany and Gardening. See Lactuca.
Lettuce, Hare's. See Sow's Thiffle.
Lettuce, Lamb. See Valeriana.
Lettuce, Wild. See Prenantues.
Lettuce, in Agriculture, the name of a plant of the efculent kind, cultivated in the field in fome diftricts for its ufe in feeding fows and pigs in the fummer feafon. It is ftated in the Calendar of Hufbandry, that the writer firft obferved: the fowing of lettuces for hogs practifed in a pretty regu.
lar Fy.fem, on the farm of a very intelligent cultivator (not at all a whimfical man) in Suffex. He had, every year, an acre or two which afforded a great quantity of very valuable food for his fows and pigs. He adds, that "it yields milk amply, and all forts of fivine are very fond of it.". And he fuggetts, that "the economical farmer, who keeps many hogs, fhould take care to have a fucceffion of crops for thefe animals, that his carts may not be for ever on the road for purchafed grains, or his granary opened for corn oftener than is neceflary." To raife this fort of crop, "the land flould have been ploughed before the winter frofts, turning in by that earth 20 loads of rich dung per acre, and making the lands of the right breadth, to fuit the drill-machine and horfe-hoes, fo that in this month (March) nothing more may be neceffary than to fcarify the land, and to drill the feed at one foot equi-diftant, at the rate of four pounds of feed per acre. If half an acre or even a rood be tried near the farm-yard, the advantage, it is fuppofed, will not be inconfiderable."

Where the flock of fwine is large, it may be proper todrill half an acre or an acre of lettuce in April, the land having been well manured and ploughed as directed above, being alfo fcufled in February and March, and well harrowed, repeating it before drilling. And at this period "the crop which was drilled in March (a fucceffion being effentially necelfary) fhould be thinned in the rows by hand, to about nine or ten inches afunder. If this neceflary attention be neglected, the plants draw themfeives up weak and poor, and will not recover it. Womien do this bulinefs as well as men. When about fix inches high, they fhould be horfe-hoed with a fcarifier or fcuffer," having the hoe aboutfour inches, or at molt five inches, in width. With this fort of green food fome kind of meal, or other dry meat, fhould. be combined, as without it, it is apt to prove very laxative, and of courfe injurious to the animals. See Hoc and SWine.
LETZKAW, in Geography, a town of Pruffia, on the Viltula; 13 miles S.E. of Dantzic.

LETZNIG, a town of the duchy of Hollein; fix miles S.S.W. of Segeberg.

## LEVANDIS Aililium Expenfis. See Expessis.

LEVANGHE, in Geograply, a rmall ifland near the E. coalt of Ittria. N. lat. $45{ }^{\prime} \mathbf{1}^{\prime}$. E. long. $155^{\prime} 52^{\prime}$.

LEVANT fignifies any country fituate to the eaft of us, or the ealtern fide of any continent or country, or that on which the fun rifes.

Levant, or Titas, one of the Hieres iffands, on the Mediterranean, near the coalt of France. N. lat. $43^{\circ} 4^{\prime}$. E. long. $6^{\circ} 34^{\prime}$.

Levant, in Mafters of Commerce, \&c. is generally reAtrained to the Mediterranean feas; or, rather, to the country on the eaftern part of it; or the coafts of Afia, and efpecially Afatic Turkey, from Alexandria in Egypt to the Black fea, including the iflands of Cyprus, Rhodes, and the Archipelago.

IIence, our trade thither is cailed the Levant trade; and a wind that blows from thence, out of the Straits mouth, is called a Levant suind.

France was the firlt nation that made treaties of commerce with the Porte. The fieur de la Foret figned them in 1535; in the name of Francis I. and thereby obtained many privileges in favour of that kingdom; which they alone ene joyed, until the Venetians, the Englifh, the Hollanders, and at length the Genoefe, likewife obtained particular privileges for themfelves.

Levant Merfures. See Measure.<br>levany, Bole of tbe. See Bole.

## L E V

Levant and Couchant, in Lazv, is, when cattle have becu fo long in another man's ground, that they have lain down, and rifen again to feed, which, in general, is held to be one night at lealt. See Distress.

Levantine Valley, or Valle Leventina, in Geography, a valley of Helvetia, fubject to the canton of Uri, and fituated S. of St. Gothard, watered by the T'efino, and inhabited chiefly by Italians. It is fuppofed to retain by its name, traces of the "Leportii," the ancient inhabitants of the furrounding regions. Its length, from the fummit of the paffage on the St. Gothard, is about eight leagues ; the breadth is very inconfiderable. The lower part is extremely populous, rich in palturage, and produces much hemp and flax. In the vicinity of the lofty moantains adjacent to it, the climate is various, and the country fubject to much rain. To prevent the rain from damaging the crops, the inhabitants fufpend and dry the corn and grafs, on bars fupported by two high poles about 15 feet afunder. The houfes are entirely of wood, and exterrally appear like Swifs cottages ; but a neglect of cleanline $\int$ s proves the vicinity and greater fimilarity to the Italians. The Tefino is here joined by the Bromio, a torrent which takes its rife in mount Uccello, or the Vogeliberg, near Splagen ; a bridge over it is the boundary of the two bailliages of the vallies Levantine and Polefe, and leads into that of Riviere. The valley now'becomes perfectly flat, and of courfe fubject to violent inundations; the few villages are feattered on the fides of the fteep mountains; all below is defolate. Offogne, the refidence of the bailiff, confifss only of a few houfes.

LEVANTO, a town of the Ligurian republic, on the coaft of the Mediterranean; eight miles W. of Spezza.

LEVANZO, a fmall inand in the Mediterranean, near the W. coaft of Sicily ; about nine miles W. of Trapani. N. lat. $38^{\circ} 5^{\prime}$. E. long. $12^{\circ} 24^{\prime}$.

Levare, Antiphonum, in the Mufic of the Romifh Church, is to begia or open the firlt note of an anthem.

LEVARI Facias, in Law, a writ directed to the theriff for levying a fum of money on a man's lands and tenements, who has forfeited his recognizance; in virtue of which the fheriff may feize all his goods, and receive the rents and profits of the lands, till fatisfaction be made oo the plaintiff: but this writ has now given way to the remedy by elegit. There is alfo a levari facias damna diffeifitoribus, for the levying of damages, wherein the diffeifur has been formerly condemned to the difeifee; and alfo a levari facias refiduum debiti, to levy the remainder of a debt upon lands and tenements, or chattels of the debtor, where part has been fatisfied before. And farther, a levari facias quando vicecomes returnavit quod non babuit emptores, commanding the fheriff to fell the goods of the debtor which he has taken, and returned that he could not fell.

LEVARLOW, in Geography, a town of Poland, in the palatinate of Lublin; 40 miles S.S.W. of Lublin.

LEVASCHEVA, a town of Ruffia, in the government of Olonetz, on the W. coalt of the lake Latcha; 16 miles S.S.W. of Kargapol.

Levatio Arietum. See Arietum.
LEVATOR, in Anatomy, a name given to various mufcles, which have the effect of drawing parts upwards, or elongating them.

Levator ani, is a mufcle connected with the inferior extremity of the inteftinal canal. See Intestine.

Levator anguli oris, is a mufcie of the lips, defcribed under Deglutition.

Levator communis labiorum, is the fame with the levator anguli oris.

## L E U

Levatores coflarum, are the commencements of the external itrata of intercoital mufcles. Sec Intencostal.
Levator labii fuperioris et ale nafi, a mufcle commora to the upper lip and the wing of the nofe. Sce Deglutition.
Levator labii fuperioris proprius, is a portion of the former, fometimes deferibed as a diftinct mufcle.
Levator labii inferioris, is the fame with the levator menti.
Levator menti, is a fmall mufcle fituated in the chin, and defcribed with the mufcles of the lips in the article Deglutition.

Levator oculi. a name fometimes given to the fuperior ftraight mufcle of the eye. See Eye.
Levator palati mollis, a mufcle of the foft palate defcribed in the article Drglutition.
Levator palpebre fuperioris, a mufcle of the orbit belonging to the upper eye-lid. See Eye.
Levator fapule, a mufcle of the fcapula, called alfo angularis, and, by Dumas, trachelo-fcapulien. It is fituated in the upper part of the back, and on the lateral and pofterior part of the neck ; it extends from the fuperior angle of the fcapula to the tranfverfe proceffes of the four firit cervical vertebre. It is elongated, flattened, and broader below than above. Its external furface is covered below by the trapezius, above by the fterno-cleido-maltoideus, and in the middle by the fkin. The internal furface covers the ferratus fuperior pofticus, the facro-lumbalis, the tranfverfalis colli, and the fplenius. The edges prefent nothing remarkable; the pofterior is longer than the anterior, and covers a part of the upper edge of the rhomboideus.
The inferior extremity is attached to the fuperior angle of the fcapula, to the upper part of its bafis, and to the internal portion of its upper edge. From this point the mufcle paffes upwards and forwards; it grows narrower, and is foon divided into four portions, which are at firf united together by cellular tiffue, but afterwards feparate to be attached to the points of the tranfverfe proceffes of the four firft cervical vertebrix. There portions are often connected to the fplenius and fcalenus potterior. Sometimes the levator fcapulx has only three portions fixed to the three firit vertebræ of the neck; that which is attached to the atlas is larger and longer than the others, which diminifh fucceffively in fize and length downwards.
It is tendinous at its attachments, and flefhy in other parts. The pofterior fibres are longer than the anterior; a fafciculus of fibres is fometimes added to its front edge from the firtt rib.

The name of this mufcle has led to a notion that it elevates the fhoulder; and it has been called mufculus patientix, from the fuppofition, that it acted in fhrugging the fhoulders. In truth it rather depreffes than elevates this part; it draws the fuperior angle of the fcapula upwards and forwards, but then the bone is rotated in fuch a way that its anterior angle, forming the fhoulder joint, is depreffed. It is affifted by the pectoralis minor. If the trapezius act in conjunction with it, the fhoulder will be elevated.' Suppofing the fhoulder to be fixed, it will incline the head and neck backwards, and towards its own fide.

LEVATUM. See Terris $\mathfrak{F}$ Catalis tentis ultra debitum.

LEUBITZ, in Geograpby, a town of Hungary ; eight miles S. of Podolicz.

LEUBUS, a town of Silefia, in the principality of Wohlen, on the Oder, near which is a celebrated Ciftercian

## LE U

abbey, founded at the commencement of the rith century; nine miles S.W. of Wohlen.

LEUCA, in Ancient Geograply, a fmall town of Italy, in the country of the Salentins, and in the vicinity of the Japygian promontory. Strabo- Alfo, a town of Afra Minor, on the confines of Ionia and Nulia. Pomponius Mela places it near.Phocra, in the gulf of Smyrna; and Pliny places it near Phocxa, on a promontory which was formerly an ifland. Diodorus Siculus fays, that Leuca was fituated between Cumx and Clazomenu.

LEUCACANTHA, in Botany, a name ufed by Diofcorides, and the other Greek writers, for the oacia tree, which produces the gum arabic, but it was allo ufed for a kind of prickly plant, called allo anmaila by fome of the Arabians; as being a plant whofe roots were knotted and jointed. Thefe joints were feparated and dried, and then ured in modicine as cardiacs and carminatives, under the names of bunk or bunken. They were of a very agreeable aromatic fmell, and very little tafte; and the ancients always preferred fuch of them as were yellow and light, rejecting thofe which were heavy and white, and which wanted fmell. It is not well known at this time what thefe roots were; but it is neceflary, in order to the right undertanding the works of the ancients, to know that there were fuch roots; and that though called by the fame name with the gum arabic tree, they were of a very different nature.

LEUCACHATES, in the Natural Hilfory of the Ancients, the name of an agate, not a peculiar ipecies, but cily a particular appearance of the lead-coloured agate, called prafachates.

LEUCADENDRON, in Bolany, from $\lambda$ avera, white, and $\delta=\delta_{g} g_{0}$, a tree, expreffive of the hoary or filvery whitenefs for which the firlt and finelt of the fpecies is remarkable. The name feems to have originated with Hermann, who conmminated to Plukenet the Silver-tree of the Cape, under the appellation of Leucadcndros Africana, for which Limneus, in his Claffes Plantarum, adopted it; but he afterwards, in his Genera, applied this name to another tribe of the fame order, and fubfequently funk both in Protca. Mr. Brown has rettored the original Letucadendron. Silvertree. Brown Tr. of Linn. Soc. v. 10. 50. (Conocarpodendra; Boerb. Lugd.-Bat. ed. 2. t. 195. 197. 200. 202-4.) - Clafs and order, Diocia Tetrandria. Nat. Ord. Aggregote, Linn. Proter, JuIf. Proteacee, Brown.

Gei. Ch. Male, Cal. Common Perianth imbricated, of numerous, unequal, fingle-flowered fcales. Cor. Petals four, equal, linear, cohering in their lower part, revolute at their extremities, downy externally. Stans. Filaments four, fhort, inferted into the petals; anthers linear, of two cells, buriting lengthwife. Pif. imperfect, or none.

Female, Cal. like the male; its fcales permanent, dilated and hardened. Cor. like the male; bearing abortive itamens. Pijf. Germen fuperior, fifile; ftyle fimple, itraight, rigid, terminal; ftigma oblique, club-fhaped, ernarginate, rather hifpid. Peric. none, except the permanent woody calyx, whofe fcales are fometimes confluent. Nut folitary, concealed by the fcales of one feed.

Eif. Ch. Male, Calyx imbricated; its fcales fingleflowered. Petals four, bearing the ftamens.

Female, Calyx imbricated, permanent. Petals four. Stigma oblique, club-fhaped, emarginate, rather hifpid. Nut of one feed, concealed by the hardened fcales of the calyx.

Thirty-eight fpecies of this noble genus are defined by Mr. Brown, all natives of fouthern Africa, near the Cape of Good Hope, where they ufully grow in moit fony or
fandy places, about rivers, and, as far as we know, in no other part of the world. A few of them have long beera cultivated in the greenhoufes of Europe, but the greater part are only known in the herbariums of the curious. One of the fineft collections of this whole natural order was procured from the Cape by Mr. Niven, for his patron G. Hibbert, efq. to whofe liberality we are indebted for fpecimens of the whole.

The habit of Letucaddadron is arboreous or fhrubby, but fometimes tortuous and depreffed. Leaves flat, liricar, lanceolate, or obovate. Heads of flowers often yellow, not large, but frequently accompanied by very large, fpreading, dilated, palifh bratcas, which are highly ornamental.Examples are
L. argenteunt. (Protea argentea; Linn. Sp. Pl. 1.37. Gxitn. t. 5I. Lamarck Illuitr. t. 53. f. I. Conocarpondendrun; Boeril. t. 195-Argyrodendros africana, foliis fericeis et argenteis ; Commel. Hort. v. 2. 51. \$. 26.) - Arboreous. Leaves lanceolate, filvery; their edges, as well as the branches, hairy. Inner bracteas flarter, downy. Corolla of the male tilky.-This fplendid tree, growing about the bafes and fides of mountains at the Cape, foon attracted the notice of the firt European vifitors, and was brought into the Dutch gardens, from wherice probably it came to England early in king William's reign. The fiozucrs are not ornamental, nor are they fearcely ever feen here, but the filvery fiplendour of the leaves is unixivalled; they are three or four inches long, feffile, lanceolate, acute, entire, fpreading in every direction, clothing the branches in great abundance. Flowers folitary, terminal.-The whole fyle is permanent in this and four other fpecies only.
L. Levijanus. Brown n. 9. Berg. Cap. 20. (Brunia Levifanus; Linn. Sp. Pl. 2Sy. B. foliis oblongis incanis, \& co ; Burm. Afric. 267. t. 100. f. 2, male plant. Protea Levifanus; Willd. Sp. Pl.v. 1. 526.)-Leaves obovate or fpatulate, very blunt; fmooth when full grown. Branches hairy. Heads of male flowers feffile. Seeds pointlefs, invefted with long hairs.-Grows in fandy heathy plains near the Care. The flem is abruptly branched. Leaves numerous, upright, about half an inch long, entire. Flowers in little round yellow heads, without any prominent bralieas.
L. corymbo/um. Berg. Cap. 21, male plant. (Protea corymboia; Thunb. Diff. de Proteá, n. 28. t. 2, male plant. Andr. Repof. t. 495, female.) - Leaves linear-awlfhaped, imbricated, fmooth. Scales when in fruit acute, recurved at the points. Seeds fonewhat comprefed, inverfcly heart-Ahapod, hairy at the edge. Found at feveral places near the Cape. Much akin to the lail in its flowers, but the leaves are totally different, refembling the narrow foliage of an Erica or Diofma. The young branches are purplin, whence it ufed to be called by gardeners, before it blofiomed, Protea purpurea. Mr. Brown obferves that each fex has four glands, or nectaries, at the bafe of the. germen, which oar lalt-defcribed wants.
L. concolor. Brown n. 15. (Protea globofa; Andr. Repof, t. 30\%. Sims in Curt. Mag. t. 878 , both male plants. P. throbilina: Schrad. Sert. Hannov, t. I, female.) -Leaves fpatulate-oblong, with a callous point; fmooth when full grown; the floral ones of the fame colour. Branches downy. Scales of the fruit obtufe, fringed; woolly at the bafe.-Fourd near the Cape. Said to have been firt raifed in England by Meffrso Lee and Kennedy. This belongs to a handfome tribe of frecies, whofe large heads of yellow flowers are encompafled by large ipreading floral leaves or bradeas, which in molt are coloured, but in this agree in hue with the foliage, and like that are aboust

## LE U

## L. E U

two inches long, and nearly one broad, with red callous tips.
L. grandiforum. Brown n. 16. (Euryfpermum grandiflorum; salif. Parad. t. 105.)-Leaves obovate-ublong, with a calloms point; fmooth when full grown; the foral ones coloured. Branches very minutely downy. Scales of bo:h fexes ovate, bluntifh, fmooth, coloured.-Gathered on nount WYnberg at the Cape, by Mr. Niven, who fent it to Mr. H.bbert. It is larger and handfomer than the latt, having fplendid whitifh brateas, refembling the pctals of fome fine polyandrous flower.
L. Arifum. Brown n. 21. (Euryfpermum falicifolium; Salif. Parad. t. 75. Protea conifera ; Andr. Repor. t. 541.) -Leaves fmooth, lincar, with an awl-fhaped point. Bracteas ovaie, acute, coloured, longer than the flowers. Scales of the fruit dilated, rounded, fmooth. Sceds without wings, dotted. - Native of moilt ftony places, about rivers, at the Cape, according to Dr. Roxburgh. Mr, tisen feems to have introduced this pretty fpecies to our gardens, which is diltinguifhed by its narrow lexves, copious and ornamental, though firall, $f_{2}$ wers, whofe bralleas are white aud pointed -This fpecies is nearly allied to Protea pallens and conifira of Linnæus and other authors, the former of which appears to be the male, and the latter the female, of Mr. Drown's L. adfcendins.
L. abictinum. Brown n. 3 I. (Protea teretifolia; Andr. Repof. t. 46..)-Leaves all thread fhaped, channelled, buntifh, fmooth, fpreading, curved flightly inwards. Scales of the fruit united by their lower part; diltinct and twolobed above. - Frequent about the Cape. A humble flbrub, with numerous fpreading fir-like green leaves, the uppermoft of which, unchanged, encompafs the little yellow heads of female $f_{\theta}$ wers, inftead of brazeas. The heads of male fowers are fmaller, and more elevated.

LeUCADIA, St. Maure, in Ancient Geography, an inand, or rather a peninfula which was attached to Epirus by a itraight ithmus, about 100 paces long and 600 broad. Upon it was fituated the town of Leucas, on the fummit of a mountain towarls the N.E. Homer places here three towns, viz. Neriton, Crocylea, and Agylipa. On the fcie of the firt of thefe towns the Corinthiais built that already mentioned; Loucas is now an illand, the ifthmus having been feparated from the coatinent. Thus Ovid deferibes it :

## " Lencada continuam veteres habuere coloni Nunc fre:a circumeunt."

It was a tradition that unfortunate lovers made choice of this promontory for precipitating themr. Tves mito the fea. On this promontory Apollo had a terrale. Sea St. Malef.

LEUCANTHEMUM, in Botany, from ג:yyo, wbitit, and $\alpha v s p^{5 y y}$, a fows, has been the appellation of feveral plants of the compound radiated kind, whofe rays are white; and now remains as the fpecific name of the common Englih Cbryyantbenum Lcucantbernum, Greai Ox-eje, or Moon Daify.
LEUCARUM, in Ancieat Goography, a place of Great Britain, on the roate from Caleva to Urioconiam, according to the Itinerary of Antonine. It is fuppofed to be the fame with the Leucomagns of the anonym. of Ravenna. It lies betwee. Scadum Nunniorum and Bomiun, and is fuppoled to be near Gaitenbury. Camden, Gale, and Baxter, imagine that Leucarum was fit:lated where the village of Locharnum or Lechorltands, on lie bank of the river Luchor in Glamorganfhire. But this feemz to be at much too great a diftance from the other ftations of Chifeiborough and A xbridg.
LiLUCAS, in Bqtanja, fo named by Burman and Brown,
in allufion to the downy whitencfs of its flowers, $2 \cdot 0 \times x$, being an ancient Greck nainc ${ }^{\text {is }} \mathrm{r}$ fume horb, now unknown to us, fo called on account of its whitenefs. Burm. Zeyl. 140. Brown. Prudr. Nov. Hoil. v. I. ;of. Ait. Hort. Kew. ed. 2. Y. 3. 409.-Clafs and order, Didjnamia (ijm. nofprmia. Nat. Ord. Verticillase, Linn. Labiata, Julf.
Brown. Brown.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, oblong, with ten ribs, pernanent; its orifice unequally toothed. with from fix to ten teeth. Cor. of one petal, ringent; tube cylindrical; upper lip vallted, bearded, undivided; lower longer, in three fegments, the middie one largeft, often nothed. Stam. Filaments four, concealed by the upper lip, two of them longer than the reft, anthers of two oblonct divaricated lobes, Pif. Germen fuperior, four-cleft; fyle the length and polition of the Hamers: Atigma cioven, acute, its upper figment faortelt. P'riá. none, except the permanent calyx. Sies's four, obloug, triangular.
EIT. Ch. Calyx with ten ribs; unequally toothed. Upper lip of the corolla bearded, undivided; lower ionger, threecleft; the niddle fegment largett. Lobes of the anthers. disaricated. Upper fegment of the lligma fhorteit.

1. I. zeylaricia. Ceylon Leucas. (1hlomis zeylanica ; Litn. Sp. I'l. S2o. Jacq. Ic. Rar. t. in ? Herba ad irationis ; Rumph. Amboin. v. 6. 39. t. 16. f. 1.)-I.cavis lanceolate, dightly ferrated. Whorls nearly teraxinal. Bracieas frinjed. Calyx oblique, with ten nearly equal teeth.-Native of the ifland of Mauritias; as well as of Java, and other parts of the Eait Indies. The root is annual. Stem fquare, downy, leafy, about a foot high, branched from the bottom in a corymbofe bulhy manner. Leaves oppofite, about an inch and half long, fearcely half an inch broad, lanceolate, bluntifh, finely downy, veiny, wavy, or blunly ferrated, tapering at the bafe into a fhort footilalk. Whorls denfe, axillary, one or two at the top of each ite:n or branch, furmounted by leaves, and accompanid by feveral linear-lanceolate, acute, downy, ftrongly fringed braakas. Calyx downy, fwelling upwards, its orto fice ublique, fringed with ten, nearly equal, fmall fpinous teeth. Corcl'a twice as long as the cally, white, hairy estcrnally, efpecially the upper lip.
2. L.- lavardulifoha. Lavender-leaved Leucas. (Leon!:rus indiens; Lina. Sp. Pl. $8_{1}$. Phlemis zeylanica 8 ; Syft. Ve.g. ed 13. 45 . Willd Sp. Pl. v. 3. 123.)-Leascs linear-lanceulte, nearly entirc. Brateas hnear, downy. Calyx oblique, with feven teeth; the uppermon largeit.Native of the Eol Indics. Linnxers had it from Eurmann. He firit defcribed it as a Leonarus, but afterwards confounded it wilh his Phlomis zeglanica, of which lat he had but a very imperfect fpecimen. The prefent is cilltinguifhed by itsmuch tonger, and nearly, if not quite, entire leaves; the whorls are more numerous; bradsas more inear, downy, but not frioged; and the cally $x$ is effentially different, having but feven, and thofe very unequal, teeth. Corolla muct like the lalt. It is hard to fay whether Jacquin's and Rumphius"s fynonyms belong to this or the zoylanica, for they neither of then teach any thing elfen ial, bui Jacquin's leaves certainly moft refemble the prefent. The three fizures of Plakenet, cited doubtingly by Linnxus, do not well accord with either.
3. L. martinicenfis. Welt Indian Leucas. (Phlomis martinicenfis; Swariz. Prodr. S8. Willd. Sp. Pl. v. 3.123. Ph. caribeas Jacq. Ic. Rar. t. 110. Swartz. Ind. Occ. v. 2. 1009.)-Leaves ovate-oblong, ferrated, downy. Bratea3 britte-haped, fringed. Whorls globofe. Calyx incur ed, with ten tee:h; the uppermolt longe?,-Native of Bralil,
and the Weft Indies, from whence Mr. Maffon fent feeds to Kew in 1781. Root annual. Stem branched, two or three feet high. Leaves ttalked, an inch and half long, oblong, more or lefs ovate, hairy above, more downy and paler beneath, bluntifh, ftrongly ferrated; entire and tapering at their bafe. Whorls numerous, axillary, denfe, manyflowered, and nearly globofe, with narrow, Arongly fringed or briltly bracteas. Calyx curved forward, downy, with frong green ribs and white reticulated fpaces between; its orifiee bordered with ten fpinous, all rather unequal, teeth, of which the upper one is twice or thrice as long as the reft. Corolla fmall, white, brown in decay.
4. L. urticifolia. Nettle-leaved Levcas. (Phlomis urticifolia; Vahl. Symb. v. 3. 76. Willden.)-" Leaves ovate, ferrated, hoary. Bracteas awl-haped., Calyx obliquely truncate, membranous, with nine teeth."-Native of Arabia Felix, and the Ealt Indies.-" Root annual. The plant refembles $P b$. indica of Linnæus (our Leutas indica), but the fem, as well as leaves, are not downy, but hoary with extremely minute hairs. The leaves are of the fame colour on both fides, deeply ferrated, flat not rugged, downy underneath. Calyx rather fmall."-We know this merely from the above authority.
5. L. indica. Eaft Indian Leucas. (Phlomis indica; Linn. Sp. Pl. S20.)-Leaves ovate, forrated, very downy beneath. Bracteas linear, hairy. Whorls globofe. Calyx oblique, with one three-toothed lip.-Native of the Eaft Indies. The feeds were fent to England by M. Thouin in 1789. Root annual. Leaves flalked, ovate, two inches long and ons broad, ferrated, downy above, but whiter and fofier beneath. Corolla very hairy. Calyx much enlarged and elongated after flowering, its forepart extended into an upright, oblong, ribbed and reticulated lip, with three fpinous teeth at the extremity; the oppofite or upper fide of the orifice being fhort, with three or four very minute teeth.
6. L. dicemdentata. Ten-toothed Leucas. (Stachys decemdentata; Forlt. Prodr. 91. Phlomis decemdentata; Willd. Sp. Pl. v. 3. 124.) -" Leaves oblong, ferrated; contracted at the bate. Whorls without bracteas. Calyx with ten teeth."-Native of the Society Inands. "Stem therbaceous, downy. Leaves ftalked, an inch long, rather acute, ferrated, downy. Whorls fomewhat ftalked, deftitute of brafeas. Caly.x bell-fhaped, with ten furrows, and ten awl-haped teeth, alternately fmaller. Tube of the corolla rather longer than the calyx; upper lip erect, undivided, very hairy; lower fmooth, in three deep fegments." Willdenow.
7. L. biffora. Two-flowered Leucas. (L. foliis rotundis ferratis, flore albo; Burm. Zeyl. 140. t. 63. f. I. Phlomis biflora; Vahl. Symb. v. 3. 77. Willd. Sp. Pl. v. 3. 124.)-Leaves ovate, ferrated. Flowers axillary, folitary, oppofite. Calyx with ten regular teeth.-Native of the Ealt Indies. A flender downy or rather hairy plant, with the habit of a Stachys or Sideritis. Leaives about half an inch long, ftalked, ovate, bluntifh, with five or fix ferzatures at each fide. Flowers nearly feffile, without braifeas. Calyx funne!--fhaped, hairy, tirongly ribbed, with ten fharp taper tecth, of which the five intermediate ones are rather fhorier than the others. Corolla twice the length of the calyx, white, downy.
8. L. chinenfis. Chinefe Leucas. (Phlomis chinenfis: Retz. Obf. fafc. 2. 19. Willd. Sp. Pl. v. 3. 125.) .s6 Leaves ovate, ferrated, clothed with filky down. Flowers whorled, Italked. Calyx with ten teeth."-Native of China. "The flem is flarubby, with fquare hifpid brauches. Leaves oppolite, ovate and fomewhat heart-lhaped, falked, fer-
rated, clothed with filky dorn. Whorls axillary, of five or fix flowers, on ftalks. Calyx funnel-fhaped, with ten furrows and ten awned teeth. Corolla white, its upper lip compreffed, hairy externally, efpecially the margin; lower thrce-lobed, nearly naked.' -Retzius.-It is to be prefumed the calyx-teeth are regular, probably five rather the fhorteft as in the laft. We have never feen this feecies, and it flands here on Mr. Brown's authority. Retzius's account of the comprelfed upper lip fhould, however, make it 2 Phlomis.
9. L. moluccoides. Wing-flowered Leucas. (Phlomis moluccoides ; Vahi. Symb. v. 1. 42. t. 14. Willd. Sp. Pl. v. 3. 125. Clinopodium fruticofum ; Fork. A.gypt.-Arab. 107.) - Leaves ovate, ferrated, finely downy. Flowers whorled, ftalked. Bracteas linear-lanceolate. Lower fegment of the calyx dilated, rounded, membranous, ribbed, obfcurely toothed.-Gathered by Forfkall in Arabia, on the hills of Hadie. One of his fpecimens in ripe feed, and Vahl's figure in flower, furely authorife us in referring this plant alfo to Leutas, though Mr. Brown has not mentioned it. The flem is flrubby, five or fix feet high, with roundifh downy branches. Leaves ftaiked, ftrongly ferrated; rough and punctate above; paler and very downy beneath; an inch or more in length. Whorls many-flowered, flalked, with downy brafteas, cut into many deep, linear, or fomewhat lanceolate, fegments. Flowers white, the fize of Lamium album, hairy, their lower lip, according to Forfkall, convex, three-lobed, the middle lobe broad, long, and heartfhaped, which agrees with the generic character, but is not properly reprefented in Vahl's plate, though indicated in his defcription. The calyzi is very peculiar, and really twolipped ; the upper lip imall, ovate and acute ; the lower very large, efpecially when in feed, fpreading, rounded, fcariofe, with feven or eight hairy ribs, and numerous reticulated veins; the margin wavy, or flightly toothed, not awned nor fpinous; the tube is hairy, and has ten flrong ribs. We can fee nothing of the lateral lobes mentioned by Vahl, and indeed he feems, in his defcription and figure, to have been bewildered between the lower lip of the caly x and that of the corolla.
10. L. glabrata. Smooth Leucas. (Phlomis glabrata; Vahl. Symb. v. I. 42. Willd. Sp. Pl, v. 3. 126.)-Leaves ovate, Serrated, nightly hairy. Flowers whorled. BraEteas minute, brifle-fhaped, fmooth. Lower fegment of the calyx elongated, three-toothed. Hairs of the flem de-flexed.-Gathered in Arabia by Forkall, amongft whofe plants it was found without a name. Vahl defcribes it as "herbaceous, the fem acutely angular, its angles and joints rough with reveried hairs. Leaves flalked, fpreading, ovate, bluntly ferrated, entire at the bafe, acute, flightly hairy, about an inch long. Whorls remote, of fix or eight fowérs. Bragieas minute, in four deep, briflle-fhaped, rather pungent, fmooth fegments, yellowifh at the extremity, but one-fourth fo long as the calyw; which is bell-fhaped, fmooth, with ten furrows, its orifice oblique, the lower lip being elongated, with three equal briftle-fhaped teeth, the upper with feven teeth. Corolla like the latt."
11. L. flaecida. Flaccid Leucas. Brown. Prodr. Nov. Hoil. v. I. 505.-" Leaves ovate, membranous, nearly fmooth, as well as the calyx, which has ten equal tecth. Whorls many-flowered."-Gathered by fir Jofeph Banks in the Tropical part of New Holland.

It will readily be perceived that the great diverfity and irregularity of shape in the caly $x$ of the different fpecies, directly militate againft the Linnæan divifion of Didysiamia Angiofermia, into genera whofe calyx is more or his exactly fire-cleft, and others in which it is two-lipped; but

## LE U

Leutas is not on that account the lefs natural a genus, and this very irregularity is its flriking character. How far it might be poffible or eligible to feparate from it the fpecies with a ftrictly regular calyx, may be worthy of future confideration. Mean while it had beft ftand in the firf of the above fections, as not being regularly or properly two. lipped, as well as on account of ite affinities.-Pblomis alba, Vahl. Symb. vo 1. 43, fhould feem alfo to belong to Leucas, though the calyx has but five teeth, but we have never had an opportunity of examining it.

Levcas Delphinus. See Delpuinus.
LEUCASJA, in Ancient Geography, an inland of the Tyrrhenian fea, upon the weftern coatt of Italy, in the gulf of Pxflum, according to Strabo and Mela.

LEUCASPIS, a port of Africa, in the gulf of Libya. Ptolemy.

LEUCATA, a promontory of Gaul, in the Mediterranean; now called "Cap de la Franqui."

LEUC 1 TE, or Levcatas, a promontory of Afia, in Bithyria, and one of thofe which formed the gulf called " Affacenus Sinus," according to Pliny.

Leucate, in Geography, a town of France, in the department of the Aude; fituated on the N. fide of a large lake of the fame name; 17 miles S. of Narbonne. N. lat. $42^{3}$ $54^{\prime}$. E. long. $3^{\circ} 7^{\prime}$.

LEUCE, or Achillis Insula, in Ancient Geography, an ifland in the Euxine fea, at the mouth of the Bory thenes. Strabo fays, that it was confecrated to Achilles. Salluft, in his Fragments, fays that it was of fmall extent and defert; and that it was famous for a temple, and for the ftatue and burying-place of Achilles.

Levce, a fmall ifland on the N. coait of the ifle of Crete; according to Diodorus Siculus.

Leuces, $\lambda$ civ\%, in Medicine, a term nearly fynonymous with the vitiligo of the Latins, fignifies a leprous affection of the fkin, of a white colour, with a lofs of fenfibility in the parts affected, the hair at the fame time becoming white, and falling off.

The lateft Greek phyficians confider the alphos and leucè as the fame difeafes effentially, differing only in degree, and not in kind. The alphos they defcribe as a fuperficial difeafe, in which the furface of the fkin becomes white, but no farther change takes place: whereas the leuce penetrates below the furface, affecting the fleh, and being much more difficult to heal. They afcribe it to an error in the affimilatory powers, in confequence of which a phlegmy or pituitous and vifcous blood is generated, which is incapable of being converted into a proper red fefh, but produces a fort of flefh like that of locults, and other cruftaceous animals: the hairs, at the fame time, turn white, and fall off, and the fkin becomes fmooth and bright, and the parts lofe their fentibility; fo that they may be pricked with needles, without fuffering any uneafinefs. In a word, the difeafe, thus defcribed, is a fpecies of elephantiafis, and appears to have been the fame thing with the leprofy of the Jews. The Arabians properly call it the wbite albaras: neverthelefs, with the later Greeks, they confider it as differing only in degree from the white albobak, (or morpbiva, as it has been called by the Latin tranflators,) which is the alphos of the Greeks. Hippocrates, however, feems to diftinguifh the leuce from the alphos: for he obferves that the latter fhould be confidered as an external blemifh, rather than as a difeafe; but he fpeaks of the leucè as a diftemper of the moft fatal kind. (De Affection. fect. 5.) It would appear, therefore, that the word alphos denotes a modification of the fcaly difeafe, the lepra Grecorum, and perhaps alfo an incipient leucè; and that leucè is a variety, a precurfor, or a

Atage of the elephantiafis. In this light Dr. Willan, in his able treatife on cutaneous difeafes, confiders them. (Sce that work, P. 124-126.) Celfus has claffed the alphos and leuce, together with the melas, (which differs from the alphos only in the blackifh colour of the fcaly fpots,) under one generic term, vitiligo: at the fame time, he points out the affinity of the alphos and melas, and the peculiar and diftinct features of the leucè. The two former, he fays, are commonly a little rough, and not continuous, but difo perfed in drops, as it were, here and there: fometimes, indeed, it fpreads more extenfively, but leaves interfices of the fkin unaffected. They are the fame in all refpects, with the exception of colour. "The leuce," he adds, "has fome refemblance to the alphos; but it is whiter, penctrates deeper, and the hairs are white and downy. They all three fpread, but with different degrees of rapidity in different individuals. The alphos and the melas appear and difappear in fome perfons at irregular periods; but the leuce does not readily quit a perfon whom it has once attacked. The two firft are not very difficult of cure: but the lall is fcarcely ever removed; and if it is at any time alle viated, yet the natural colour of the fkin is never entirely reftored:" (Celfus, de Re Med. lib. v. cap. xxviii.) He then ltates the obfervations in regard to the prognofis, which are repeated by the Greek phylicians; namely, that if we would afcertain whether the difeafe be curable or not, we fhould prick or fcratch the fkin with a needle. "If blood iffues, which generally happens in the two former, the cafe is remediable; but if a white humour appears, it will not admit of a cure, and therefore we mult make no fuch attempt." (Loc. cit. Compare alfo Aetius, Tetrabib. ivo ferm. i. cap. cxxxiii. Actuarius, Meth. Med. lib. ii. cap. xi. Paul. Ægineta, de Re Med. lib. iv. cap. v.) The impaired fenfe of feeling in the parts is mentioned as an additional fymptom of the irremediable ftate of leucè, by the lait named authors. See alfo Foreftus Obf. Chirurg. lib. vo obf. iii.

The appellation of leuce is derived eitber from $\lambda$ evzo; leucos, white, or from $\lambda: u n n$, leuce, the subite poplar tree, the whitenefs of the bark and leaves of which has perhaps been fuppofed to refemble the condition of the fkin in the difeafe above defcribed. See Gorter. Definit. Med. See alfo Leprosy.

LEUCELECTRUM, a name given by fome authors to that fort of amber which is white and opaque, and ufuatly of a fatty look.

LEUCHARS, in Geography, a town of Scotland, in Fifeflire, near the German ocean. Int 1 Soi the number of inhabitants was 1657 ; 6 miles N. of St: Andrews.

LEUCHTENBERG, a town of Bavaria, and capital of a landgraviate, to which it gives name: 36 miles $E$. of Nuremberg. N. lat. $49^{\circ} 35^{\prime}=$ E. long. $12^{\circ} 11^{\prime}$.

LEUCHTERSHAUSEN, a town of Germany, in the marggravate of Aufpach, on the Altmuhl; g miles W. of An!pach.

LEUCI, in Ancient Grograpby, a long chain of mountains in the ifle of Crete, fo called from their whitenefs, being covered for a great part. of the year with fnow. They are now known by the names of Madura and Specia.

LEUCISCUS, in Icbebyology. See Dace.
LEUCITE, Leuzit, Wern. Amphigène, Haüy. Vefuvian or cubite garnet, Kirw. Vulcanit, leucolite, granatine florl of fome mineralogitts.

Its colour is commonly greyifh or yellowihh-white, feldom afh-grey, milk-white, or greenifh and reddiß-white, paffing into flefh and tile-red.

It occurs in grains, but moolt frequently in round cryftals
of twenty-four trapezoidal planes, (Amphigine trapezoidal, Haüy, p. 147. f. 62.) or, as the form is defined by Werner, low double eight-fided pyramids, in which the lateral plares of the one are fet on the lateral planes of the other, while the fummits are flatly acuminated cach by four planes placed on the alternate edges. They are more or lefs regular; fometimes perfecily fo, at other times rather rounded on the edres. They are crytallized all around, and imbedded. Their fize varies from very fmall to middle-fized: cryflals of more than one inch in diameter arc, however, feldom feen. No other modification than the trapezoidal has been hitherto obferved.

The furface of the grains is rough, and dull or weakly glimmering; that of the cryitals gliitening and fmooth, not friated, as in the garnets of the fame form: there are, however, fometimes minute rents feen to run parallel to the flort diagonal of the trapezoidal planes. Externally they are gliflening, internally fhining, with vitreous luftre rather inclining to refinous.

Fracture imperfectly and flat conchoidal, fometimes inclining to foliated; fragments indeterininately angular, more or lefs fharp-edged.

It occurs commonly flightly tranflucent, but alfo nearly tranfparent, and rarely with perfect tranfparency.

The leucite is hard in a low degree, feratching olfafs with difficulty: it is brittle, and cafily frangible. Specitic gravity, 2,461 , Karften; 2,464 , Kirwan; 2,468 , Brifion; $=, 45$; (from Vefuvius), and 2,490 (fromAlbano near Rome,) Flaproth.

It is infufible before the blowpipe without addition: with borax it melts into a light brown, tranfparent glafs.

The leucite was firft analyfed by Klaproth, who dif. covered in it a confiderable portion of vegetable alkali; a iubfance till then unfufpected to form a conltituent of mineral fubltances. Vauquelin's fubfequent analy fis completcly agrees with that given by Klaproth.

| Mcan of different | Analyfes. |  | Klaproth. | Vauquelin. |

|  |  |  | 100 | 100 |

Leucite occurs particularly in lava, and alfo in rocks belonging to the fletz trapformation of Weruer. It fhould however be obferved, that what has been defcribed by feveral authers as leucite in bafalt, trapp, \&c. is nothing but cubic zsolite (analcime of Haïy). Faujas, Efinark, and others have fallen into this error.

Many places have been mentioned where leucite is found; but the beft authenticated locality is that of the neighbourhood of Naples, and of Rome. They are found in immenfe quantities in the mountains of Albano, Tivoli, Caprarola, Viterbo, Aquapendente, Civita Caftellana, and Borghetto, where they are feen enveloped in lava, often accompanied by mica, vefuvian, and hornblende.

Von Buch, Salmon, Patrin, and others, are of opinion, that the leucite crytals were formed in the lava when flill in a Huid flate; Dolomieu and Werner, on the other hand, coulider them as having pre-exifted in the rocks that were afterwards converted into lava. The idea of other mineralogical writers, who look upon thefe cryltals as being garnets altered by volcanic fire, is now defervedly expioded.

Haily's name of amphigine is derived from the double origin
of the leucite, with regard to its primitive form, which may be either the cube or the thomboidal dodecahedron. LEUCOCROTTA, in A'atural Hiflory, the name given by many authors to a bealt, fuppofed to be the fwiftett of all creatures in the world: others have called it leucrocotta, but the true name is leocrocotta.

IEUCOGRA, a name by which fome authors have called the fubitance, more ufually known by the name of morochthus, and called in Englifh, French chalk, or Brianfon chalk.

LEUCOGRAPHIS, the name ufed by fome of the ancient writers, for the fubitance commonly called morochthus, or French chalk.

LEUCOIUM, in Botany, a name adopted from the ancient Greek authors, who neverthelefs differ about their 2esxno\% That of Theophraftus appears to be the Linnean Galunthus, whillt that of Diofcor:des is doubtlefs, from his fhort account, the Cbeiranthus, or Stock. The prefent genus is nearly alied to Galantbus, and having been called Narcifo-Leucoiam by Tournefort, Linnxus adopted the above generic name. Snow. Flake. - I inn. Gen. 16 c . Schreb. 215 . Willd. Sp. Pl. v. 2. 30. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 352. Ait. Hort. Kew. ed. 2. vo 2. 21 I. Juff. 55. Lamarck. Hantr, t. 230. (Narciffo-Lencoium; Tournef. t. 20S.) -Clafs and order, Hexandria Mongyria. Nat. Ord. Spubbacea, Linn. Narciff; Juff.

Gen. Ch. Cal. Spatha oblong, obtufe, compreffed, opening at the fat fide, withering. . Cor bell-fhaped, fpreading; petals fix, equal, ovate, flat, coalefcing at the bafe; their tips thickifl and Atraight. Stam. Filaments fix, briftle-flaped, very thort; anthers oblong, obtufe, quadrangular, erect, diftant, burfing in the upper part. Pi/f. Germen inferior, roundifh; Atyle moftly club-fhaped, obtufe; lligma fetaceous, erect, acute, longer than the flamens. Peric. Capfule turbinate, of three cells and three valves. Sceds-numerous, roundifh.

Obf. Leuceiuns autumnale and tricophyllum have a threadglaped ftyle.
Eff. Ch. Corol'a fuperior, bell-fhaped, of fix equal petals, thickened at their fummit. Stigma fimple. Stamens equal.

1. L. vernum. Spring Snow-flake. Linn. Sp. Pl. 4 r4. Curt. Mag. t. 46. Jacq. Fl. Auftr. t. 312 -Spatha fingle-flowered. Style club-fhaped. - A native of moit woods and flady places in various parts of Italy, Switzerland, Germany, and the fouth of France. It flowers in the early fpring ; its fpecific name indeed is indicative of this circumitance. Bulb oblong, fmaller than that of the Daffodil. Lcaves flat, darkifh-green, about four or five in number, broader and longer than thofe of the Snow-drop. Stalk radical, angular, hollow and channelled, furnifhed towards the top with a whitim fpatha, opering at the fide, from whence the flower proceeds. Corolla rather large, its petals white, tipped with green. The plant has an agreeable fragrancy, fomething like Hawthor:1.
2. L. aflivum. Summer Snow-flake. I.inn. Sp. Pl. 4140 Engl. Bot. t. 621 . Curt. Lond. fafe. 5. t. 23. Jacq. Auttr. to 203.-Spatha many-flowered. Style club-fhaped. -Firlt determined to be a native of this inland by Mr. Curtis, who found it growing between Greenwich and Woolwich, as well as in the Ifte of Dogs. It has fince been gathered in many other parts of England, particularly Weltmoreland, Suffolk, and Berkfhire, flowering in May. Root a roundifh bulb. Leajes numerons, erect, a foot and half in length, obtufe, keeled, bright-green. Stalk radical, as long as the leaves, compreffed. Spatba lanceolate, erect. Partial falk folitary and fingle-flowered. Flowers pendulous, white; petals

## L E U

petals tipped with green. Anthers obtufe, burfing by two pores at the fummit. Capfule elliptical, threc-celled. Seeds globular, large.

The plant is entirely without fmell, but is extremely ornamental, and may be often feen in rultic gardens.
3. L. autumnale. Autumnal Snow-flake. Linn. Sp. Pl. 414. Curt. Mag. t. 960. Redouté Liliac. to 150. f. 2.-Spatha many-flowered. Style thread-fhaped. - A native of Spain and Portugal, flowering, as its name imports, in the autumn. Bulb thickifh, of many glutinous coats, covered with a white membrane. Stalk radical, about fix inches in height, reddifl-brown, moftly bearing two or three white, pendulous, inodorous flowers, red at their bafe. Leaves capillary, fpringing up after the plarit has flowered. Curtis however fays that in fpecimens which were fent from Gibraltar, the leaves appeared at the fame time with the flowers, though confiderably fhorter than they afterwards grew.
4. L. trichophyllum. Briftle-leaved Snow-flake. Brot. Lufit. p. I. 552. Redouté Liliac. t. 150. f. I.-Spatha two-leaved, many-flowered. Style thread-fhaped.- Gathered on the fandy plains of Barbary, flowering in the midit of winter. Leaves thread-fhaped, membranaceous. Stalk radical, fheathed by the leaves at its bafe, thread-fhaped, five or fix inches high. Flowers from two to four, pendulous, white, occafionally tinted with red on the outfide.

Redouté regrets that he could not call this hyenale, as the name of trichophyllum had previoully been applied by Renealmius to the laft fpecies, to which indeed this is clofely allied. The fpecific name of byemale would have been particularly defirable on account of carrying on the analogy of nomenclature with the three other fpecies. It is greatly to be wifhed that botanifts who give new names to plants would well confider fuch analogies.

For L. Arumofum, Ait. Hort. Kew. ed. I. 407. t. 5, fee Strumaria.

Leucoium, in Gardening, comprehends plants of the bulbous-rooted flowery or perennial kind, of which the fpecies cultivated are the great ipring fnow-drop (L. ver. num) ; the fummer fnow-drop (L. xftivum) ; the autumnal fnow-drop (L. autumnale); and the many-flowered Cape leucoium (L. ftrumofum). The firt has an oblong bulb, fhaped like that of the daffodil, but fmaller; the leaves are flat, deep green, four or five in number, broader and longer than thofe of the common fnow-drop; the fcape angular, near a foot high, hollow, and channelled; towards the top comes out a whitifh fheath, opening on the fide, out of which come out two or three flowers, hanging on flender peduncles; the corolla is much larger than that of the common fnow-drop; and the ends of the petals are green. They appear in March, and have an agreeable fcent, not much unlike thofe of the hawthorn.

The flowers, which at firft fight refemble thofe of the common fnow-drop, are eafily dittinguifhed by the abfence of the three-leaved nettary. They do not come out fo foon by a month. The firlt is called by Mr. Curtis the fpring fnow-flake.

In order to diftinguilh the fecond fort from the galanthus, Mr. Curtis names it the fummer now-flake; and in gardens it is commonly known by the name of the great fummer fnow-flake, and the late or tall fnow-drop.

Method of Culture.-Thefe plants are readily increafed by off-fets from the roots, which fhould be feparated from the old roots about every third year, in the fummer feafon, as foon as their leaves begin to decay, in the fame manner as other bulbous roots. See Bulbous Roots.

They are alfo capable of being increafed by feeds, which Vol. XX.

## L E U

fhould be fown in the latter end of Auguft, in a border of light bog-earth. The plants fhould remain in this fituation till the fecond fummer, and be then taken up at the proper period, and planted in beds, till they begin to flower, when they fhould be removed into the borders. In this way they are three or four years before they flower. But by much the beft method is to procure the roots from the nurferymen, and plant them in the beginning of the autumn, in an caftern or northern border, where the foil is of a boggy quality, in patches of three or four together, in the fronts, putting them in to the depth of about three or four inches.

The off-fets fhould be planted out in beds a year or two after being taken off, till fit to be fet out for flowering.

A foft loamy foil, or a mixture of loam and bog-earth, are the molt fuited to their healthy growth. The laft fort requires protection in the houfe, with other Cape bulbs.

By planting them in the different afpects mentioned, a longer fucceffion of flowers may be produced.

They are very ornamental in the fronts of the borders, or the fides of the lawns, and other parts near the houfe, or other public fituations.

Leucoium Indicum ct lutcum. See Stock Gilly Flower.
Leucoium Bulbofam. See Leucoium, Jupra.
LEUCOLIBANON, in the Materia Mcdica of the Ancients, a name given to the white olibanum, or frankincenfe, which they carefully diftinguifh from the reddifh or yellowifh olibanum. This was alfo called argyolibanum, or the filver-coloured olibanum; and the yellow one chalcolibanum. This latter word is ufed in the Apocalypfe of St. John, and is mifunderftood fo far, as to be tranflated brafs, and fuppofed to be a kind of brafs from Mount Lebanon. See Chalcolibanon and Frankincense.

LEUCOLITHOS, in Natural Hi/fory, a name given by fome of the Greek writers to the pyrites argenteus, or filvery pyrites. The ancients had a great opinion of thefe foffils in difeafes of the eyes; they ufed all the kinds of pyrites, or marcafite, after calcination, for this purpofe; but as they diftinguifhed four kinds of them, they attributed thefe virtues, in different degrees, to the different kinds; therefore they had recourfe to fo many peculiar names for diftinguifhing them; and the white kind was called leucolithos, to diftinguifh it from the dufky one called the iron pyrites, and the deeper and paler yellow kinds, called the gold and braffy marcafites.

LEUCOMA, $\Lambda_{\varepsilon \cup \chi \alpha \mu} \alpha$, among the Athenians, fignified a public regifter of the whole city, in which were written the names of all the citizens, as foon as they came to be of age to enter upon their paternal inheritance.

Leucoma (derived from $\lambda$ euxos, rubite, fignifies, in Surgery, a whitifh opacity of the cornea. Profeffor Scarpa, of Pavia, has made fome interefting remarks on this cafe in his "Offervaz. fulle Principali Malatien degli Occhi." He informs us, that the albugo and leucoma are very different from what has gone under the name of the nebula of the cornea, fince they are not the confequence of a flow chronic inflammation of the eyes, accompanied by a varicofe flate of the veins, and an extravafation of a thin milky ferum into the texture of the delicate layer of the conjunctiva fpread orer the cornea; but are either produced by a violent acute phthalmy, wherein a denfe coagulable lymph is effufed fuperficially or deeply into the fubftance of the cornea itfelf, or elfe are occafioned by wounds, or ulcers attended with lofs of fubftance. Albugo ftrictly denotes the firft of thefe cafes; leucoma the laft, particularly when the fcar, or opaque fpot, occupies the whole or a confiderable portion of the cornea.

A recent albugo, remaining after the fubfidence of a 4 C violent

## LEU

## LE U

violent actute ophthalmy, is of a clear milky colour ; but when inveterate, it puts on a chalky or pearl colour, and in this frequently appears to have no vafcular connection with the relt of the cornea, occafioning no ureafnefs, and being incapable of being abforbed.

Prorided the testure of the cornea be not diforganized by the coagulable lymph extravafated in a cafe of recent albugo, the opacity may often be difperfed by employing, in the firf Atage, general and local bleeding, internal antiphlogiftic medicines, and emollient applications; and in the fecond ftage, mild aftringents and corroborants. Thefe laf, as foon as the inflammation is fubdued, excite the action of the abforbents, by which veffels the opaque extravafated lymph, forming the albugo, is to be removed.

But although a recent albugo may often be difperfed, this object cannot be. fo eafily effected when the difeafe has exifted a long while, in which cafe the abforbents have frequently loft their activity, and the fructure of the cornea become fo diforganized, that this membrane mult for ever remain opaque at the part affected. According to Scarpa, the circumftances favourable to the cure are a recent ftate of the difeafe without diforganization of the cornea, or of the delicate layer of the conjunctiva fpread over jt, and the patient being young, as at this period of life the abforbents are molt capable of action. Scarpa affures us, that he has feen many examples in children, where the \{pecks, left on the eye after a violent ophthalny, have fpontaneoully difappeared in the courle of a few months.

The following local remedies Scarpa has found moft ferviceable, both to recent and inveterate cafes of albugo. A collyrium, compofed of two fcruples of fal ammon., four grains of rerugo, and eight ounces of aqua calcis. Thefe are to ftand for twenty-four hours, and the liquor then be filtered for ufe. An ointment, confifting of the fubfequent iengredients. W Tutix f. p. 3 i Aloes f. p. Calom. 玉 $\overline{\text { a }}$ grij. Butyr. recent. ©is. M. Janin's ophthalmia ointment, and the gall of ox, fheep, pike, and barbel, applied to the cornea with a hair-pencil, are alfo favourably fpoken of. When the eye was too irritable to bear the preceding application, Scarpa fometimes ufed with advantage the oil of walnuts, fomewhat rancid. Two or three drops were introduced into the eye every two hours, and the plan followed up for feveral months. He has likewife found the juice of the leffer centaury, mixed with honey, a good application.

How unpromining foever things may feem, the furgeon is to perfit in the trial of remedies, at lealt three or four months, before the cafe is to be fet 'down as ablolutely incurable.

Scraping and perforating the cornea, and forming an artificial ulcer upon it, are all unavailing expedients in cafes where the albugo or leucoma is in a ftate that Scarpa terms inveterate and coriaceous, fuch meafures being the invention of perfons quite ignorant of the ftructure of the cornea, and the principles upon which its tranfparency is to be reftored.

LEUCOM IENAS, in Ichtbyology, a name by which fome bave called the fmaris, a fmall fifl caught in great plenty in the Mediterranean.

LEUCOPETALOS, in Natural Hilory, the name of a beautiful ftone defcribed by 'Pliny, as being of a fine gold yellow, variegated with white.

LEUCOPETRIANS, in Ecclefiafical Hifory, the name of a fanatical feet which fprang up in the Greek and Eaftern churches towards the clofe of the twelfth century: the fanatics of this denomination profeffed to believe in a double Trinity, rejected wedlock, abtained from felh, treated with
the utmoft contempt t'ce facraments of baptifm and the Lord's fupper, and all the various branches of external worhip, placed the effence of religion in internal prayer alone, and maintained, as it is faid, that an evil being, or genius, divelt in the brealk of every mortal, and could be expelled from thence by no other method than by perpetual fupplication to the Supreme Being. The founder of this enthulialtical fect is faid to have been a perfon called Leucopetrus, and his chief difciple Tychicus, who corrupted, by fanatical intcrpretations, feveral books of fcripture, and particularly St. Matthew's gofpel. Mofheim.

LeUCOPHÆA Antelope, in Zoology. See Antelope Lencophaa.

LEUCOPHAGIUM, a name given by fome phyficians to a fort of medical aliment good in confumptions, and other general decays. It is compofed of fweet almonds ma. cerated in rofe-water with the tender flefh of a capon, all being finally boiled together to a pulp, capable of being paffed through a fieve.
LEUCOPHLEGMATIA, in Medicine, from $\lambda$ euxos, cubite, and ${ }^{2} \lambda \mathrm{sy} \mu \mathrm{z}$, pifuita, phlegm, a term applied to the dropfy of the flin, or anafarca, in confequence of the very pallid hue of the fkin and complexion under fuch circumflances.
Dr. Cullen remarks, that the terms anafarca and leucophlegrmatia have been commonly confidered as fynonymous: buc fome authors have propofed to conider them as denoting diftinet difeafes. The authors who are of this laft opinion, employ the name of anafarca for that difeafe which begins in the lower extremities, and thence gradually extends upwards; while they term that leucophlegmatia, in which the fame kind of fwelling appears, even from the beginning, very generally over the whole body, and in which there ap. pears to be a greater deficiency of the blood; fuch as occurs after profule hxmorhagies, or other great evacuations. The diftinction, however, is principally verbal. See Ana. sarca, and Dropsy.

LEUCOPHRA, in Zoology, a genus of the clafs Vermes, and order Infuforia: this worm is invifible to the naked eye, and every where ciliate. There are eight \{pecies, of which four are found in the waters or marhes of our own country.

## Species.

Conflicror. Spherical, fub-opaque, with moveable inteflines; it is found in clear water; is of a ycllowifh colour, with dark edges, and filled with very minute molecules in perpetually violent agitation. This animalcule is defcribed and figured in Adams' Effays on the Microfcope. It is faid to be rather a heap of animalcules than a fingle individual, is larger than moit fpecies of the vorticella, perfectly fpherical, and femi-tranfparent. It rolls at intervals from right to left, but feldom removes from the fpot where it is firft found. In proportion to the number of moleculcs above-mentioned, which are accumulated on one fide or the other, the whole mafs rolls cither to the right or left; it is then sranquil for a fhort time, but the conflict becomes more violent, and the fphere moves the contrary way in a fpixal line. It is a fine object for the microfcope, but requires to be obferved with much attention. When the water begins to fail, the little creatures affume an oblong, oval, and even cylindrical figure ; the hind part of fome being compreffed into a triangular fhape, and the tranfparent part efcaping as it were from the inteftines, which continue to move with the fame violence till the water wholly fails, when the molecules are fpread intu a thapelefs mafs, which foon vanifhes,

## LE U

## LE U

and the whole fhoot into a form, having the appearance of cryftals of fal-ammoniac. See Adams, p. 500.
Vesicutifera is ovate with veficular inteftines. This animalcule is a fort of mean between the orbicular and oval, very pellucid, with a defined dark edge, and infide containing fome very bright veficles or bladders. The middle frequently appears blue, and the vefickes feem as if fet in a ground of that colour. The accounts given of this animalcule by Spallanzani and Müller differ in fome refpects; the latter, however, admits that he once faw an individual like thofe defcribed by Spallanzani.

Acuta. The oval leucophra, which is round, with a black point at the edge.
Fluxa. Simate, kidney-fhaped; body oblong, jellowiff, obtufe on one part, the other produced into a cone, and generally filled with molecules.

Armilla. Round, annular; body thickened above and bent like a ring.

Cornuta. Inverfely conic, green, opaque. This animalcule has a refemblance to certain fpecies of the vorticella, and requires to be obferved fome time before its peculiar characters can be afcertained : the body is compofed of molecular veficles, of a dark green colour, for the moft part it is like an inverted cone, the fore-part being wide and trun. cated, with a little prominent horn, or hook, on both fides; the hind-part is conical, ciliated, the hairs exceedingly minute; thofe in the fore-part are three times longer than the others, and nuve in a circular direction. The hinder part is pellucid, and fometimes terminates in two or three obtufe pellucid projections. The animalcule will at one moment appear oval, at another reniform, and ciliated at the forepart ; but at another time the hairs are concealed. When the water which contains it evaporates, it breaks and diffolves into molecular veficles. It is found late in the year in marhy grounds. See Adams, $\mathrm{Pl}_{0} 25$.

Heteroclita. Cylindricab, obtufe on the fore-part, the hind-part furnifled with a double crefted organ, which it can thruft out and draw in at pleafure. To the naked eve it appears like a white point; inteftines vifible by a microfcope, when it feems a cylindrical body; the fore-part obtufely round, the middle rather drawn in, the lower part round, but much fmaller than the upper part. With a lens of pretty high power the whole body is found to be ciliated.

Nodulata. Ovate oblong; deprefled, with a double row of tubercles. This fpecies is found in the inteftines of the Lumbricus terreltris, and Nais littoralis; it is very pellucid, fhining like filver, and is propagated by a tranfverfe divifion; it is of an oval fhape when young, and growing more oblong with age ; it is truncate at the tip.

IEUCOPIPER, in the Materia Medica, a name by which fome authors have diftinguifhed the white pepper.

LEUCOPOGON, in Botany, fo named by Mr. Brown, from גevxos, whbite, and $\pi$ wywv, a beard, on account of the white erect hairs on the upper fide of the fegments of the corolla, very confpicuous even in dried fpecimens. Brown. Prodr. Nov. Holl. v. 5+1. Ait. Hort. Kew. ed. 2. v. 1. 323. (Perojoa; Cavan. Ic. v. 4. 29.)-Clafs and order, Pentandria Monogynia. Nat. Ord. Epacrider, Brown.

Gen. Ch. Cal. Perianth interior, of feven leaves, erect, permanent; the five innermolt equal, lanceolate, concave; two outer ones ovate, oppofite, much fhorter. Cor. of one petal, fumnel-fhaped, limb in five fpreading equal fegments, longitudinally bearded on the upper fide, with denfe, erect hairs. Neftary glandular, furrounding the bafe of the germen. Stam. Filaments five, thread-fhaped, equal, inferted into the tube ; anthers incumbent, oblong, burting length-
wife, rifing jut above the tube. $p_{i f 2}$. Germen fuperior, roundifh; ftyle flort, columnar; fligma obtufe. Peric. Drupa more or leff fucculent, or fometimes dry when ripe, fometimes cruftaceous. Nut of from two to five cells, with one or two pendulous feeds in each.

Eff. Ch. Outer calyx of two leaves. Corolla funnes. fhaped, its limb fpreading, longitudinally bearded. Filaments included in the tube. Drupa of from two to five cells.

In the Prodromus of Mr. Brown, fo rich in hotanical novelties, we find the definitions of forty-eight fpecies of this new genus, which he has feparated from the Stypbelia of preceding writers; retaining in the latter fuch plants only as have four or more leaves to their external calyx ; a more elongated and cylindrical corolla, with five interral tufts of hair near the bottom, the limb revolute as well as bearded; filaments prominent; and a rather dry drupa, always of five cells.

Leucopogon is divided into five fections, of each of which we fhall give fome examples.

1. Spikes axillary, many-fowered. Drupa juicy. Six fpecies.
L. lanceolutus. Brown n. I. (Strpbelia lanceolata; Smith Bot. of New Holland, 49 ; excluding the fynonyms from both authors.)-Spikes drooping, a argregate. Fruit oval, of two cells. Leaves lanceolate, flat; many-ribbed beneath; with three furrows above. Branches fmooth.Sent dried from Port Jack fon, New South Wales, by Dr. White, in 1793. The living plant we believe has never been brouglit to this country; $L$. lanseolatus of the new edition of Hort. Kew. being certainly Stypbelia parsiffora of Andr. Repol. t. 287 ; S. Gnidium, Venten. Malmar. t. 23 , which appears to us a very different fpecies, rath.er agreeing with the characters of L. apiculatus, Brown n. \%.The true lanceolatus is a larger flrub, with copious, fender, leafy, round branches, ufually quite fmooth, fometimes very minutely downy; the young ones reddifh, "becoming angular and ftriated when dried. Leaves fcattered, llightly fpreading, feffile, lanceolate, flat, fharp-pointed, entire, fmooth, above an inch, but rarely approaching to two, in length, a quarter of an inch broad; of a full rather glaucous green above, and marked with three fine, often obfolete, furrows, from the bafe to the middle; the under fide paler, with nurferous, branching, parallel ribs, Stipulas none. Spikes clutlered about the ends of the branches, fpreading or drooping, nearly the length of the leaves, flender, loofe, many-flowered, the common ftalk flightly downy. Flowers fmall, white, feffile. Bralicas folitary under each Hower, ovate, concave, ribbed, downy-edged, of the fize and exact appearance of the two outer calyx-leaves, placed contrary to them, permanent. Inner caly,x-leaves twice as long as the outer, and fmoother, rather fhorter than the tube of the corolla, whofe limb is reflexed, with a tolerably denfe, but not very white beard, at leaft in the dried fpecimen. Drupa of two cells, oval, twice as long as the inner calyxleaves, crowned by the fylle, which is about a third of its length.
L. verticillatus. Brown n. 6.-Spikes mofly terminal, aggregate ; drooping when in fruit. Drupa of five cells, five-lided. Leaves interruptedly cluftered, fomewhat whorled, oblong-lanceolate, taper-pointed. Gathered by Mr. Brown on the fouthern coaft of New Holland. We have what anfwers to his defcription from King George's found, on the weft coaft, communicated by Mr. Menzies. It is much larger than the preceding. Leaves from two to three or four inches long, and three quarters or more broad, fomewhat roughiih to the touch, marked on both fides with five ribs, befides innumerable oblique lateral ones beneath:

## L E Uj

four or five growing together in a fort of whorls. The lateral branches are alfo often whorled. Spikes much as in the laft, but longer. Bralleas ribbed, fmooth, twice as large as the outer calyx-leaves.
2. Spikes avillary, fometimes terminal, of thrce or more flowers. Calyx and bradeas coloured. Drupa rather dry. Leaves not beart-floped. Fourteen fpecies.
L. apiculatus. Brown n. 7. (Styphelia parviflora; Andr. Repof, t. 287? S. Gnidium ; Venten. Malmaif. t. 23 ?)Spikes terminal, fomewhat aggregate, of five to feven flowers. Bracteas lanceolate, rather larger than the outer calyx-fcales. Leaves lanceolate-oblong, erect, flightly concave, calloustipped, fmooth at the edges. Drupa cruftaceous, turbinate, depreffed, fhorter than the calyx.-Gathered by Mr. Brown on the fouth coalt of Naw Holland. He obferved a fmooth variety and a downy one, which he fufpects may be diftinct fecies.-The above characters moft minutely anfwer to the above plant of Andrews, raifed from New Holland feeds, and to be feen in feveral greenhoufes, flowering in May. It is a fmall /hrub, with apparently deciduous, rather glaucous leaves, hardly an inch long, fmooth, with little, denfe, upright, ufually folitary, terminal fpikes, of pretty fnew-white flowers.
L. revolutus. Brown n. 13.-Spikes moftly terminal, aggregate, of four or five flowers. Calyx and bracteas minutely downy, the latter half the fize of the outer calyxfcales. Leaves rather fpreading, linear-oblong, obtufe, with a blunt callous point; convex and rough above; fmooth and furrowed beneath; the edges reflexed and naked. Branches finely downy. Drupa dry, obovate, with five cells. -Found by Mr. Brown on the fouth coaft of New Holland, and by Mr. Menzies at King George's found. It is not very unlike the laft, but the leaves are fmaller, more fpreading, and rough on the upper fide with minute points. The fowers are larger, and very confpicuous for the long white hairinefs of their fegments.
L. ericoides. Brown n. 17. (Styphelia ericoides; Smith Bot. of New Holl. 48. Epacris fpuria; Cavan. Ic. v. 4. 27. t. 347. f. 1.)-Spikes copious, axillary, folitary, of three or four flowers. Leaves oblong-linear, fpreading, fharp-pointed; recurved at the edges; roughifh above. Bracteas pointlefs. Inner calyx-leaves membranous. Drupa dry, angular.-Native of New South Wales, and of Van Diemen's land. A bufhy / $b r u b$, with leaves fcarcely half an inch long, almoft every one of which is accompanied by a much fhorter axillary fjike of three or four flowers. The fegments of the corolla are ftraight and fharp, looking reddifh (as Cavanilles defcribes them) when dry, elegantly bearded with white hairs, which, as the flowers open, feem to form a denfe web in the mouth of each.
'To this fection alfo belong, among others, the Stypbelia, tab. $64,65,66,67$, of Labillardiere.
3. Spikes axillary or terminal. Leaves heart-faped. Calyx and bradeas membranous or leafy. Five fpecies.
L. amplexicaulis. Brown. 21. (Styphelia amplexicaulis; Rudge Tr. of Linn. Soc. v. 8. 292. t. 8.)-Spikes axillary and terminal, [preading, ftalked, longer than the leaves, which are heart-fhaped, pointlefs, clafping the ftem; minutely downy beneath; recurved and fringed at the edge. Branches hairy. Drupa lenticular, of two cells.-Found near Port Jackfon. The Alems are feveral from one root, moftly fimple, round, reddifh, clothed with fine horizontal hairs. Leaves fpreading, near an inch long, half an inch wide, with many ribs. Caly.x and brateas finooth, acute. Segments of the corolla recurved, very hairy. Drupa comprefled, oblique.
L. difans. Brown n. 23,-Spikes terminal, aggregate,
zigzag. Flowers diftant. Leaves ovate, fomewhat heartfhaped, deflexed, pointlefs, minute; convex above; downy beneath. Drupa cruftaceous, obovate, flat-topped, of five cells.-Gathered at King George's found by Mr. Menzies, to whom Mr. Brown, like ourfelves, was indebted for fpecimens. The branches are long, clothed with numerous little reflexed convex leaves. Spikes very peculiar, being long, flender, with remarkably zigzag, downy ftalks. Brazeas heart-fhaped, concave, ribbed, permanent. Calyxleaves very broad. Segments of the corolla recurved, very denfely bearded.
4. Spikes terminal. Calyx and bratteas ratber leafy. Drupa
dry. Leaves not heart-_baped. Eight fpecies.
L. microphyllus. Brown n. 26. (Perojoa microphylla; Cavan. Ic. v. 4. 29. t. 349. f. 2.)-Spikes cluftered, of few flowers. Leaves of the calyx pointed, half membranous. Bracteas leafy, ribbed. Leaves oval, flat, obtufe, pointlefs; of the fame colour on both fides. Drupa cruftaceous, of one or two cells.-Native of the neighbourhood of Port Jackfon. A pretty little /brub, with minute, rather imbricated, fmooth, thickifh leaves. The little fpikes of flowers, cluffered about the ends of each branch, form round heads. The inner leaves of the calye are narrow, acute, finooth, and thin. Segments of the corolla thick, recurved, very denfely covered with white hairs, as in L. difans, and indeed the generality of the fecies.
5. Stalks axillary, two-flowered; bere and there only fingleflowered; in which cafe there, are feveral brädeas. Drupa dry. Fifteen fpecies.
L. acuminatus. Brown n. 37.-Stalks very fhort, erect, moftly two-flowered. Leaves nearly upright, linear-lanceolate, very fharp, flat, with a briftly point; their margins rough, finely toothed.-Found by Mr. Brown in the tropical part of New Holland, as are fix others of this fection, one of them, $L$. rufaifolius, having been difcovered there by fir Jofeph Banks. Moft of the reft are natives of Port Jackfon, but none of them have come under our infpection.
This is, on the whole, a very elegant as well as natural genus, and it is to be regretted that only one of the fpecies has hitherto been made known to our cultivators of curious plants. The plumy whitenefs of the flowers gives a friking and peculiar afpect to the whole.
LEUCOPSIS, in Zoology, a genus of the Hymenoptera order, of the clafs $\ln$ fecta. The mouth is horny with fhort jaws; the mandible thick and three-toothed at the tip; the lip, which is longer than the jaw, is membranaceous, and emarginate at the tip; it has four feelers, fhort, equal, and filiform; antenne fhort and clavate; thorax with a long lanceolate fcale beneath; wings folded; fting reflexed and concealed in a groove of the abdomen. There are four fpecies, all foreign infects; three found in the fouth of Europe, and one in Tranqliebar.

## Species.

Gigas. Black ; thorax with two dorfal yellow dots ; abdomen feffite, with four yellow bands. It inhabits France; the wings are dufky; hind-thighs with numerous teeth:

Dorsigera. Abdomen feffle, black, with two yellow bands, and a dot between them. It is found in Italy, Switzerland, France, and fome parts of Germany. Head is black; thorax gibbous, black with a double tranfverfe yellow line; abdomen compreffed and grooved on the back; fting double, as long as the abdomen, and reflexed back into the abdominal groove; legs yellov, fpotted with black; hind legs toothed, with a black fpot. This beautiful infect is figured in Adams' work on the microfcope; the drawing was taken from a fpecimen in her prefent majefty's cabinet of infects.

## LE U

## I. E U

There is one alfo in the cabinet of Linnrus, now in the poffefion of our very able coadjutor, Dr. Smith, P. L. S. It appears at firft fight like a wafp, to which genus the folded wings would have referred it, had not the remarkable fting or tube on the back have prevented it. It is thought to be a fpecies between, and uniting the fphex and wafp, in fome degree partaking of the characters of both. The antenne are black and cylindrical, increafing in thicknefs towards the extremity ; the joint neareft the head is yellow ; the head is black; fo alfo is the thorax, encompaffed with a round yellow line, and furnifhed with a crofs one of the fame colour near the head. The fcutellum is yellow ; the abdomen black, with two yellow bands, and a fpot of the fame colour on each fide between the bands. The anus and the whole body, when viewed with a low magnificr, appear punctuated, and the points, when examined carefully, feem to be hexagonal, and in the centre of each hexagon a fmall hair is feen.
Petiolata. Black; abdomen petiolate ferruginous; the petiole with a yellow dot each fide. It is found in Tranquebar. The thorax is elevated, with two yellow ftreaks before; under the fcutel is a yellow dot ; the fecond fegment of the abdomen is edged with yellow, and the tail is black; legs black edged with yellow; wings black.

Cglogaster. Abdomen feffile; fcale of the thorax half as long as the abdomen. It is found in fome parts of Germany. The thorax has a yellow band behind, and the eyes are black.

LEUCORRHAA, in ATedicine, $\lambda . s x z z_{5} 5^{5} s x$, literally fignifying fluor albus, or white fux, is a diforder of the uterus or its paffages, from which a whitifh or pale coloured fluid is difcharged, accompanied by pain in the loins, confiderable lofs of ftrength, and a wan fickly arpect. It is commonly expreffed by the appellation of "the whites" by the patients, or is fimply called " a weaknefs."

Every ferous or puriform difcharge from the vagina has been comprehended under this appellation: it is obvious, however, that fuch difcharges may be various, and may proceed from various fources. They may proceed more efpecially from the veffels of the uterus itfelf, or from thofe of the vagina only. In the latter cafe, which is probably not a very common occurrence, the caufe of the excretion mult be purely local: it fometimes happens during the period of pregnancy. In thefe inftances, there mult be either a local weaknefs and relaxation of the parts, or fome irritation may exift or have been applied, fo as to excite the mucous glands, the fecretion from which ferves to lubricate the parts, to pour out their fluids in an unufual quantity. The exiftence of little aphthous ulcerations within the labia fometimes gives rife to fuch a difcharge, in which cafe there is alfo a confiderable degree of forenefs and tendernefs in the parts; and the ufe of thofe inftruments, called peflaries, has been faid to produce a fluor albus, from the pain and irritation which they occafion.

In general, however, the difcharge of leucorrhæa proceeds from the fame veffels of the uterus itfelf which pour out the catamenia. This inference may be deduced from the following circumitances. In the firt place, the leucorrhæa is moft common in thofe women who are fubject to an immoderate flow of the menfes. Secondly, it appears principally, and often exclufively, a little time preceding, and again pofterior to the menfrual difcharge ; the latter diminifing in proportion as the leucorrhæa is increafed, or feeming to be converted into the leucorrhæa. Thirdly, the leucorrhra often continues after the period when the catamenia have altogether ceafed, and frequently fhews a confiderable tendency to a periodical recurrence. And laftly,
it is commonly accompanied with the fame local and conflitutional fymptoms as an exceflive flow of the menfes; fuch as pale:ipfs of the countenance, a feeble pulfe, an un. ufual debility on taking exercife, a hurry of the breathing from even moderate exertion; and at the fame time the back bccomes pained by any continuance in the erect poflure, the extremities are frequently cold, and fome œedema affects the feet in the evening. The debility alfo manifefts itfelf by affections of the ftumach; fuch as lofs of appetite, flatulence, and other fymptoms of indigeltion ; by palpitations of the heart, with frequent fenfations of finking and fluttering about the epigaftric region, and even actual fyncope; and by a depreffion of fpirits, and a weaknefs of mind liable to ftrong emotions from flight caufes, efpecially when operating fuddenly ; in a word, by all the train of diftreffing fymptoms which have been denominated nervous. The inference, that the difcharge is uterine, is farther confirmed, when it is obferved, that it had neither been preceded nor accompanied by any fymptoms of a local affection of the vagina; and that it had not appeared foon after communication with a perfon who might be fufpected of giving infection; nor had, from the firlt appearance, been accompanied with any iaffammatory affection of the pudenda

The laft obfervation applies particularly to the diagnofis between the difcharge of leucorrhæa and that arifing from venereal infection; a point which is worthy of more particular confideration. It is very eafy to dintinguifh a fimple leucorrhæa from a recent gonorrhæa; for befides the general debility, and the nervous fymptoms above-mentioned, which frequently accompany the former, the colourlefs nature of the difcharge, which only ftiffens, without ftaining the linen, and the abtence of all heat and fcalding on paffing the urine, together with the ceffation of the difcharge at the time of menftruation, fufficiently characterize the leucorrhæa; whillt in the gonorrhæa there is itching, inflammation, and heat of urine, the orifice of the urinary paffage is prominent and painful, there is frequent irritation to make water, and the difcharge ftains the linen of a yellow or greenifh colour. But it mult be remembered, that the difcharges from the vagina, which have been denominated leucorrhæa, are fometimes opaque and of a yellowifh colour, and fometimes accompanied with a degree of ardor urinæ and inflammation of the external labia. This may happen in women of bad habit of body, or where there is ulceration in the vagina or uterus ; but in both thefe cafes the difcharge is of a fanious nature, and very offenfive; and in the latter is commonly accompanied with fevere pains in the region of the uterus, and extending from the loins round the pelvis to the groins, and even down the thighs. The difcharge is fometimes fo acrimonious, in thefe inftances, as to inflame and excoriate the paffages. In the herpetic or aphthous affection of the orifice of the pudendum, there is heat of urine with the difcharge ; but the difcharge is very fcanty, and the labia extremely tender and fore, fo as fcarcely to admit of fitting, except upon a foft feat; which does not take place either in proper leucorrhæa, or in gonorrhæa in general. . In many cafes, the circumitances of the patient, which render it either impofible or in the higheft degree improbable that any infectious connection cart have taken place, will of courfe admit of no hefitation in the decifion; and it is often upon thefe circumltances alone that the practitioner is obliged to depend in forming his opinion.

The caufes of leucorrhra are chiefly to be fought for among thofe agents and carcumitances, which tend to produce a debility of the fyitem in general, or of the uterus in particular. Of the former kind, are imperfect diet, fatigue, anxiety, and much watching; the practice of fuck-

## I E U

ling children too long; damp, clofe, and uncleanly habitations; caufes which chiefly operate among women of the lower clafs. To thefe may be added, the almoft total want of proper exercife, living too much in warm chambers, and drinking much of avarm enervating liquors, fuch as tea and coffee, which influence principally women of better ftations. The fources of local debility to the uterine fyltem itfelf are many ; fuch as blows, bruifes, and falls; frequent abortions, or frequent child-bearing without nurfing, difficult and tedious labours, profule difcharge of the catamenia, or of the lochia after delivery; venus immodica; \&c.

On the other hand, the effect of leucorthea, efpecially when it has continued long, is, in many cafes, to prevent conception and occafion barrennefs; or, if conception take place, to produce a fucceffion of mifcarriages: not to mention the conftitutional and nervous derangement already deferibed. However, if the leucorrhxa be moderate, and be not accompanied with any confiderable overflow of the catamenia, it may often continue long without inducing any great degree of debility; and it is only when the difcharge has been very copious, as well as conftant, that its effects in that way are very remarkable.

The means of cure will confift of thofe expedients which contribute to ftrengthen the general habit, and the uterine fyftem locally. The fytem generally is to be fupported by all thofe means which regimen, diet, and medicine contribute; namely, by light and nutritious diet; by moderate exercife, by fome means of geftation, as in a carriage, on horfeback, or failing (the exercife of walking, both from the conftant crect pofture, and the action of the mufcles, being liable to produce irritation, and to augment the uterine difcharge) ; by the ufe of the tepid or cold bath, according to the ftrength of the patient, and the feafon of the year; by drinking the chalybeate mineral waters ; or by taking fome of the preparations of iron in the way of medicine, efpecially the muriated tincture, or the fulphate, together with the cinchona, or other vegetable tonics. The mineral acids are fometimes beneficial under the fame circumftances.

The uterus itfelf and its cornections may be flrengthened either by dircet local applications, or by internal medicines, which are commonly determired to the urinary paffages, and from the vicinity of thefe are often communicated to the uterus. Thefe laft mentioned medicines are cantharides, turpentine, and balfans of a fimilar nature; by which the difeafe has often been relieved or even cured. The former clafs includes a variety of aftringent lotions and injections, by which the difcharge may alfo be often diminihhed, and in young women, when the complaint is recent, entirely cured. Thus the parts may be wafhed twice or three times a day with a weak folution of the acetite of lead, or of alum, in rofe water; or an infulfion of rofe leaves, or of green tea, or the chalybeate mineral waters, make very proper lotions: or thefe liquors may be thrown into the vagina twice a day, through an ivory pipe, by means of the elaftic gum. But in general injections are unwillingly ufed, unlefs when the difeale is inveterate. When the matter difcharged is acrimonious, and inflames and excoriates the parts, or excites very tronblefome and painful itching, the greatelt relief is ubtained by keeping the parts clean and cool, removing the acrimonious matter frequently by bathing with cold water, or with any of the above-mentioned altringent liquors.

Dr. Hamilton remarks, that women lhave, in many inflances, been cured of the molt obftinate habitual fuor albus by giving fuck. See his Treatife on Midwifery, pto io.

LEUCORODIUS, in Ornithology, a name by which fome have called the platea, or fpoonbill, a very remarkable kind of fork or heron.

LEUCORYX, Antilope or Aniclope leneory:, in Zoo. logy, the Gazella Indica, having fingular horns, of Nov. Com. Petrop. xiii. 470.1. ro. f. 5.Oryx of Op flian, Cyneg.ii. v. 445 , leucoryx of Pennant, is a fpecies of Antelope, which has very long, flender, upright; taper, flarp-pointed horn3, very flightly bent backwards and annulated at the bafe; the body being of a milk-white colour. It inhabits the inland of Gow Bahreia, in the buttom of the Perfian gulf, near Baffora. It is about the fize of a Welih runt or Imall cow ; the head is large and broad, with a thick broad mofe, like that of a cow, and fomewhat flouching ears; the body is thick and clumfy, and the whole is of a pure white except the middle of the face, the fides of the cheeks, and the limbs, which are tinged with red : the tail is longifh, and is tufted at the end with a brufh of hairs; the horns are of a black colour. Dr. Pallas mentions a horn, apparently belonging to this animal, or fome feccies nearly refembling it, which was found in a foffile ftate, in Siberia. The female comes into feafon in autumn, and brings forth in fpring.

LEUCOSCEPTRUM, in Botany, a new genus named ${ }^{-}$ by Dr. Smith, is derived from $\lambda_{\text {evoo }}$;, white, and sknempon, a fceptre, on account of its elegant fceptre-fhaped fpike of white flowers. The author of this genus remarks that "it has the habit of a Buddleia, but belongs to the fecond fection of $V_{\text {itices }}$ in Juffieu, near $V$ crbena; and fhould, along with Verbena, Itand near Mentba in the Linnzan fyttem."-Sm. Exot. Bot. vo 2. 113.-Clafs and order, Didjnamia Gymnofpermia. Nat. Ord. fee above.
Eff. Ch. Corolla unequal, in four fegments; the upper. mof deeply cloven. Calys five-cleft. Stamens declining, much longer than the corolla, parallel. Seeds four.

1. L. canum. Hoary Leucofceptrum. Sm. Exot. Bot. t. 116.- This is the only feecies known, and was gathered by Dr. Buchanan in the woods of Upper Nepal, where it flowers in December, and is called Mrutfola by the Nawars. The brancbes are obtufely quadrangular, compreffed, clothed with fine, denfe, whitifh pubefcence. Leaves on fhortifh, downy footitalks, oppofite, elliptical, pointed and tapering at both ends, bluntly ferrated, veiny ; green and naked above; white and downy beneath. Spike terminal, folitary, feffile, erect, cylindrical, denfe, many-flowered. Brateas fmall, in four rows, oppofite, each common to many flowers. Calyx tubular, downy; its margin obtufe, unequally fivecleft. Corolla longer than the calyx, with a fhort tube; the limb in four, very unequal, obtufe fegments, of which the uppermoft is deeply divided; the lowermolt, or lip, large, concave, and entire. Stamens declining, parallel, threadfhaped, fmooth; the two longelt double the length of the lip. Anthers roundifh, two-lobed, yellowifh. Germen fuperior, four-lobed. Style declining, as long as the longer flamens, with a cloven, acute fligma. Seeds four, truncated, naked, in the bottom of the calyx.
This is one of the numerous fplendid plants fent by Dr. Buchanan, from the mountains of Nepal, to Dr. Smith, which fo greatly enrich the work whence the above defcription is chiefly taken.

LEUCOSPERMUM, fo named by Mr. Brown, from גeuvo;, qubite, and $\sigma \pi \underline{\rho} \mu \dot{\alpha}$, the feed. Brown Tr. of Linn. Soc. v. 10. 95. Ait. Hort. Kew. ed. 2. v. 1. 195. (Leucadendron ; Salif. Parad. t. ir6. Protex, fect. 3, piltillis capitatic ; Linn. Mant. 2. 198.)-Clafs aud order, Tetrandria Monogynia.
iilonogyrid. Nat. Ord. Agzregati, Linn. Protix, Jult. Proo traces, Brown.

Gen. Ch. Cal. Common Perianth of numerous fingleflowered fcales, collected into a head, cither permanent and hardened, or membranous and deciduous. Cor Petals four, irregular, lincar; three of them cohering by their lower part; the fourth feparate and narrower. Stum. Filaments four, fhort, infurted into the petals; anthers linear, concealed by the petals, of two cells, burking lengthwife. Pij2. Germen fuperior, feffile, roundifh; itigma cylindrical, rigid, deciduous; ftigma fwelling, fmouth, fomewhat obliquc. Peric. Nut tumid, fmooth, fingle-fecded.

Eff. Ch. Petals four, unequal, three of them cohering by their lower part. Anthers funk in the hollows of the upper part of the petals. Style deciduous. Stigma fwelling, fmooth. Nut fuperior, feffile, tumid, fmooth.

Eighteen fpecies are defined by Mr. Brown, all natives of fouthern Africa, about the Cape of Good Hope, growing for the moft part in dry, fandy, rather elevated fituations. Eight of them are cultivated in the Royal Garden at Kew. The whole are divided into two fections; the firt having a rounder head of flowers, whofe calyx-fcalcs are permanent, becoming fomewhat hardened, of which defeription are fourteen fpecies; the remaining four have a flatter common receptacle, with narrow deciduous fcales, of which the innermolt are very thin and chaffy. All are forubs of rather humble growth, rarely arborefcent; many of them downy or hairy. Leaves either entire, or furnifhed with callous teeth at the extremity. Flowers yellow, in terminal heads.

An interefting fpecimen of this genus is
L. tomentofium. Brown. n. 13. Ait. Hort. Kew. n. 7. (Protea tomentofa; Willd. Sp. Pl. v. 1. 5 14. Limn. Suppl. 118. P. candicans; Andr. Repof. t. 29+.)-Style nearly the length of the corolla. Stem erect. Leaves linear or wedgefhaped, downy, three-toothed. Calyx-fcales lanceolate, nearly equal to the tube of the corolla.-This is faid to be very rare in England. Mr. Maffon fent it from the Cape to Kew in 1789 , and Meffrs. Lee and Kennedy ralfed it from feed the year following. The whole $/ b r u b$ is clothed with fine fhort down of a glancous hue, the flem rather hairy. Leaves two inches long, various in breadth, fpreading, coriaceous, dilated outwards, bluntly and unequally threetoothed at the end. Heads of flowers produced in Auguft and September, terminal, foiltary, feffile, about the fize of a walnut, variegated with orange and ycllow, their fcales tipped with dark brown. Few of the Proteaceous tribe are more difficult to increafe by cuttings.
LEUCOSTAPHYLOS, a name given by fome authors to the water-elder, or opulus.

LEVE', Fr. in Mufic, the $u p$, an unaccented part of a bar in beating time. Sce Arsis, and Accent, in Muffe.

LEVEL, a mathematical inftrument ufed for drawing a line parallel to the horizon, and continuing it out at pleafure ; and, by this means, for finding the true level, or the diference of afcent or defcent between feveral places, for conveying water, draining fens, placing the furfaces of floors, acc. level, and for various other purpofes in agriculture, architecture, hydraulics, furveying, \&c.

The word comes from the Latin libella, the crofs beam that forms the brachia of a balance, which, to be jult, mult ftand horizontally.
There is a great variety of inftruments of this kind, differently conftructed, and conftituted of different materials, according to the particular purpofes to which they are ap-

## 1. E V

plied, as the carpenters' level, mafons' level, balance Icvelt, mercurial levels, furveying and fpiral levels. But, however their conttruction may vary, they may be all referred to the following three clafes: viz. is. Thofe in which a vertical line is determined by a fufpended plumb-line, or a balance weight, and the horizontal pofition is fhewn by a line perpendicular to it. 2. Thofe which determine a level line by the furface of a fluid. 3. Spirit-levels, which point out the horizontal direction by a bubble of air floating in a fluid contained in a glafs tube. For the purpofes of agricellture, thofe of the improved water, air, fpirit, and foot kinds are moit commonly ufed.

Thofe of the firlt kind, depending upon the plumb-line, are very common, but not very accurate: the fimplett form is that of two rulers, united together in the form of the letter L ; they mult be exactly perpendicular to cach other : then if a plumb-line is fufpended from the top of the vertical ruler, and the edge thereof be made to coincide with the plumb-line, the other ruler mult be horizontal. This, when applied to the top of a wall, a beam, or floor, will thew if they are horizontal. This is the kind of level ufed by artificers: fometimes it is found like the letter $A$, of threc rulers, the plumb-line being fufpended from the vertex, and the two legs fet on the furface to be levelled. The line hangs opppofite to a mark, made on the middle of the crofs ruler, when the feet are on the fame level. Befides thefe there are many other forms. For an inftrument of this kind, fee Plate IV. Surveying, fig. 5.

Levex, Plumb, or Pendulum, that which fhews the horizontal line by means of anothe: line perpendicular to that defcribed by its plummet, or pendulum.
It confilts of two legs, or branches, joined together at right angles, whereof that which carries the thread or plummet is about a foot and a half long. This thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread paffes is hollow, that it may hang free every where but towards the bottom, where there is a little blade of filver, whercon is drawn a line perpendicular to the telefcope. The faid cavity is covered by two pieces of brafs, making, as it were, a kind of cafe, left the wind fhould agitate the thread; fer which reafon the filver blade is covered with a glafs $G$, to the end that it may be feen when the thread and plummet play upon the perpendicular. The telefcope I is faftened to the other branch, or leg, of the inftrument, and is about two feet long, having a hair placed horizontally acrofs the focus of the object-glafs, which determines the point of level, when the ftring and plummet hang againit the line on the filver. blade.

All the accuracy of this inftrument depends on the telefcope's being fitted at right angles to the perpendicular. It has a ball and focket, by which it is faftened to its foot: and is faid to have been the invention of M. Picard.

Here we may introduce an account of other levels conAructed on the fame general principle. For the foot-lcoel; fee Foot-livel.

Level, Artillery-foot, is in form of a fquare, having its two legs, or branches, of an equal length; at a juncture of which is a little hole, whence hangs a thread and plummet, playing on a perpendicular line in the middle of a quadrant ; it is frequently divided into 90 degrees, or rather into twice 45 degrees from the middle. See fog. 6.

This inttrument may be ufed on other occafions, by placing the end of its two branches on a plane; for when the thread.

## L E V EL.

ithread plays perpendicularly over the middle divifion of the quadrant, that plane is affuredly level.

To ufe it in gunnery, place the two ends on the picce of artillery, which you may raife to any propofed height by means of the plummet, whofe thread will give the degree above the level.

Level, Carpenters', and Paviors', confifts of a long ruler, in the middle whereof is fitted, at right angles, another fomewhat bigger, at the top of which is faftened a line with a plumnet; which, when it hangs over a fiducial line at right angles with the bafe, fhews that the faid bafe is horizontal.
'This and the mafons' level, though very common, are elteemed the beit for the practice of building, though the operations by them can only be fhort.

Level, Gunners', for levelling cannons and mortars, is an inftrument reprefented in Plate IV. Surveying, fig. 7, confifting of a triangular brafs plate, about four inches high : at the bottom of which is a portion of a circle, divided into $45^{\circ}$, which number is fufficient for the higheft elevation of cannons and mortars, and for giving fhot the greateft range. On the centre of this fegment of a circle is fcrewed a piece of brafs, by means of which it may be fixed, or moved, at pleafure. The end of this piece of brafs is made fo as to ferve for a plummet and index, in order to fhew the different degrees of elevation of pieces of artillery. This inftrument has alfo a brafs foot to fet upon cannon or mortars, fo as when thofe pieces are horizontal, the whole inftrument will be perpendicular.

The ufe of this level is obvious, and confifts in placing the foot thereof on the piece to be elevated; in fuch manner as that the point of the plummet may fall on the proper degree: this is what they cail levelling the piece.

The moft curious inftrument for the ufe of the artillerift, was lately invented by the very ingenious colonel Congreve, of the royal artillery; having the following qualifications viz.-I. It will find the inclination of any plane, whether above or below the horizon. 2. By applying it either to the cylinder, or outfide of any piece of ordnance, angles of elevation or depreffion may be given to the 6 oth part of a degree, with lefs trouble than the common gunners' quadrant, which only gives to the 4 th part of a degree. 3. It will give the line of direction for laying either guns or mortars to an object above or below the horizon. 4. It will find the centre of metals of any piece of ordnance. 5. With it, a point may be found in the rear of a mortar-bed, in the vertical plane of the mortar's axis; confequently a longer line of fight is given for directing them to the object than the ufual way. 6. It anfwers all the purpofes of a pair of callipers, with the advantage of knowing (to the roodth part of an inch) diameters, whether concave or convex, without the trouble of laying the claws upon a diagonal fcale. 7. On the fides of the inftrument are the following lines, viz. equal parts, folids, planes, and polygons, logarithms, tangents, verfed fines, fines and numbers, plotting fcales, and diagonal fcale of inches for cutting fuzes by. 8. In the lid of the inftrument-cafe is a pendulum to vibrate half feconds. It is likewife of fingular ufe in furveying; as, I. It takes hocizontal angles to the 6 oth part of a degree. 2. Vertical angles. 3. Levels. 4. Solves right-angled plane triangles. 5. Oblique-angled plane triangles. 6. Anfwers all the purpofes of a protractor, with the advantage of laying down angles exactly as taken in the field. N. B. Captain Jordane's ingenious inftrument anfwers nearly the fame purpofes.

Level, Majons'; is compofed of three rules, fo joined as
to form an ifofceles tringle, fomewhat like a Roman A; ac the vertex whereof is faftened a thread, from which hangs a plummet, which pafies over a fiducial line marked in the middle of the bafe, when the thing to which the level is applied is horizontal; but declines from the mark when the thing is lower on one fide than the other.

Level, Balance, for Surveying, confifts of a telefcope or ruler with fights, and another ruler fixed perpendicularly to the middle of it, in the form of T , with a weight at the lower end. The whole is fufpended by a thread, or upon centres, fimilar to a fcale beam, and the weight of the vertical leg makes the fights or telefcope affume the horizontal pofition. Its advantage is, that it adjuits itfelf to the level line, which can be transferred to any diftant object, by obferving it through the fights or telefcope. It is neceffary to enclofe it in a box or cafe to avoid ofcillation from the wind. This inftrument is convenient, but not very accurate.

Another balance level, called the "reflecting level," is of French invention, afcribed to M. Caffini. A telefcope or ruler, with plain fights, is fufpended vertically ; a mirror is fixed juft before the object glafs, being inclined at an angle of $45^{\circ}$ with the axis of the telefcope. Now as the telefcope hangs vertical, and the mirror bends the rays at a right angle, they will of courfe be horizontal. The telefcope mult be provided with a diagonal eye-piece, to bend the rays again horizontal, for the convenience of obfervation. Other modifications of this principle by Mellrs. Grandjean and Geuffanes may be found, in the volumes of the Machines approuvés par l'Academie. They are to be confidered as more ingenious in theory, than applicable to practice.

A balance level, invented by Mr. Richard Drew, is defcribed in the $25^{\text {th }}$ volume of the Tranfactions of the Society of Arts. It confints of a tube, provided with fights at both ends, and fufpended from a point confiderably above its centre of gravity. It has a fliding weight, adjuftable by a fcrew, to place the tube truly horizontal. This is, perhaps, the beft kind of balance level which has appeared.

To the fecond clafs of levels belongs the water level. This fhews the horizontal line by means of a furface of water, or other liquid : founded on this principle, that water always naturally places itfelf level.
The moft fimple is made of a long wooden trough, or canal, whofe fides are parallel to its bafe; fo that being equally filled with water, the furface thereof fhews the line of level. This is the chorobates of the ancients, defcribed by Vitruvius, lib. viii. cap. 6 .

The mafons frequently employ this, where they would make the top or courfes of a wall truly level: they form the trough by a ridge of mortar or clay ftuck round on all fides on the top furface of the wall; and filling the trough, thus formed, with water, they can meafure if it is equally deep in all parts.

This fort of level is allo made with two cups fitted to the two ends of a pipe three or four feet long, about an inch in diameter ; by means of which the water communicates from the one to the other cup; and this pipe being moveable on its ftand, by means of a ball and focket, when the two cups become equally full of water, their two furfaces mark the line of level.

This inftrument, inftead of cups, may alfo be made with two fhort cylinders of glafs, three or four inches long, faftened to each extreme of the pipe with wax or maltic. Into the pipe is filied fome common or coloured water, which fhews itfelf through the cylinders, by means of which the line of level is determined ; the height of the water, with refpect to the centre of the earth, being always the fame in both cylinders.

## L E V EL。

linders. This level, though very fimple, is yet very commodious for levelling fmall diftances:

Another water level is a glafs tube, bent into the form of U, having a cup at the top of each leg. This being mounted on a pedeftal, and filled with water, or other fluid, it will, from the principles of hydroftatics, ftand at the fame level in both cups; and by looking through the glafs, any diltant objects which appear to coincide with the furface of the water, in both cups, will be on the fame level with them.
A refleling level is, that made by means of a pretty long furface of water, reprefenting the fame object inverted, which we fee crect by the eye; fo that the point where thofe two objects appear to meet, is in a level with the place where the furface of water is found. This is the invention of M. Mariotte.

Of a fimilar nature are the mercurial levels, but they are furnifhed with two fmall fights, provided with crofs-hairs: thefe float upon the furfaces of the fluid in the cups, the crofs-hairs of each being equally diifant from the furface. A line feen through the fights will be parallel thereto, and confequently horizontal. One of thefe by Alexander Keith, efq. is defcribed and illultrated by drawings in the 2 d volume of the Edinburgh Tranfactions, p. 14, \&c. from which we fhall here fubjoin the following extract. Fig. S. (Plate IV. Surveying,) is a fection of the inftrument formed of mahogany or boxwood. A, A, are two oblong fquare cavities connected together by a narrow clofe channel, running from the bottom of the one to the other. $\mathrm{B}, \mathrm{B}$, are two grooves hollowed out of the wood, in order to contain the lights, Scc. They are fhut up by a lid, which turns upon a fcrew-nail at the centre C, as may be feen more diftinctly from fig. II.

Fig. 9. D, D, are the two fights, the one with a fmall hole, the other with a crofs-hair. Thefe fights are erected upon two pieces of ivory or hard wood, which are flaped nearly of the dimenfions of the cavities $A, A$, but fo much fmaller as to enter, without touching or rubbing on the fides. Mercury is poured into the two holes A, A, till they are about half full; the two pieces of ivory which fupport the fights are put into the cavities, and float on the furface of the mercury.

Fig. 10. is a perfpective view of the inftrument when the fights are floating upon the mercury; and fig. y. is another view of it, when the fights are taken out and the lid is open.

As the two cavities communicate with each other, the furface of the mercury in both is always upon the fame line of level; and conlequently, if the two fights are once accurately adjufted, they will ever after point out the true level, without requiring any after adjultment.

When this inftrument is to be ufed, it may be laid on any horizontal furface, and the fights will immediately become an exact level. It may alfo be fixed on a tripod as the firit-level; or it will anfwer equally well, if it is affixed to the top of a fingle flake, which is Charpened at the point fo as to be puhhed into the ground. If it is to be ufed as a pocket-inftrument, it may be made of feven inches length, being about double the dimenfions of the annexed draught. A common walking cane forms a very convenient fupport. It is affixed to the cane by means of a brafs pin E, which paffes through the hole G, and through the eye or bole of the walking ftick; and a brafs nut F , fcrewing to the male-ferew of the brafs pin, keeps them firm together. The two grooves $B ; B$, contain the two fights and brafs pin, when not in ufe. Two corks, covered

Vor. XX.
with thin leather, fited into the holes $A, A$, confine the mer cury, when the inftrument is to be tranfpurted; or, in cale the mercury is found to efcape, it may be poured into a fmall cafe, made of lignum vitx, like a tooth-pick cafe; and this may be ftopped with a cork, and made to fit into one of the grooves.
The advantages of this inftrument over the firit-level are: Ift, It requires no adjuftement, coufequently two obfervers, though otherwife not equally aceurate, mult make the fame obfervation. 2dly, With this, the level of iwenty different places may be taken during the time required to adjatt the fpirit-level for one obfervation. 3 dly, The micety of the fpirit-level depends upon the fmall curve of the glafs-tube, in the doice of which no rute can be laid down; ncither is any thing gained, in point of exactuefs, by leng thenimg the fpirit-tube above three or four inches. But every inftrament of this kind is of one ftandard; and the further the two fights are removed from one another, the more any crror is diminifhed. 4thly, This inftrument can be made perfectly juft, without taking any obfervation, or comparing it with another level. In order to do this, let the floats on which the fights reft, be of the fame dimenfion and weight, and let the crofs-hair and eye-lole be of one height, and without farther adjuftment, they will point ous the true level.

To the third clafs of levels belongs the fpirit level, called alfo the "air level," which is more accurate than any other kind, and is moft extenfively ufed. The invention of this inftrument has been afcribed to M. 'Thevenot. Others have attributed this application of a bubble of air to Dr. Hooke. The inltrument confifts of a cylindrical glafs tube filled with fpirits of wine, except leaving in it a fmall bubble of air: its ends are hermetically fealed to keep in the fluid. This bubble, being the lighteft of the contents of the tube, will, by the laws of hydroftatics, always run towards that end of the tube which is molt elevated; but when the tube is perfectly horizontal, the bubble will have no tendency towards either end. The tube is not flrietly cylindrical withinfide, though it bears that appearance ; it is flightly curved, the convex fide being upwards, and by this means the bubble will reft in the middle of the tube when it is horizontal, but approaches either end which is elevated above the other. The fimpleit form of a fpirit level for fixing any plane truly horizontal, confilts of a glafs tube of the above defcription, called a bubble tube, fixed into a block of wood, as at A B, fot . r. of Plate V. Surveying. The lower furface D E of the block is made flat ; and when the bubble C tlands between two fcratches marked on the glafs at $a b$, the line D E is horizontal. The method of making it correct is this; the tube is firit fitted into the block, the lower edge, D E, of which is placed on a bench or table as nearly horizontal as can be detcrmined, fo that the bubble ftands between the fcratches $a, b$. The level is now reverfed, that is, the end D is put where E was at firft. In this pofition, if the bubble Itands in the middie, it proves the level to be correct, and the table horizontal ; but if it runs to cither end of the tube, it fhews that end to be too much elevated: fuppofe it B, for inftance; this end of the tube muft therefore be let deeper into the wood, or the furface DE rectified to produce-the fame effect: one-halt the error mult be compenfated by this means, and the other half by rectifying the table or fupport; for $\mathcal{D} \mathcal{E}$, the level, mult now be reverfed again to verify thefe corrections; and when they are fo made that the bubble flands at $a b$, either way, the level is correct.
To illuttrate this more plannly, fee fy. 2, wiich reprefents. a fection of a bubble tube; but, for elucidation, is fhewn as
if curved much more than they are ever made. Suppofe the convex or upper furface of the tube to be a fegment of a large circle 13 CD , from the laws of hydroflatics it is plain, that the bubble of air, being the lighteft body in the sube, will certainly occupy the higheft point of the circle at C ; and the two points $13, \mathrm{D}$, being equally diflant therefrom, will be in the fame horizontal line B ED. The larger the radius of the circle D B , fo will the level be the more fenfible of any deviation from the horizontal, becaufe the bubble will have to traverle a greater diftance along the tube, in proportion to any partial clevation of either end. The numerous dipit levels applied to the delicate aftronomical inftruments made by Mr. Troughton, and defrribed in our articles Circie, Equatonal, 'Transit, \&c. are, in general, forned by grinding the inlide of the tube to a circle of near 400 feet radius. In a level of this kind, the elevation of one minute of a degree, of the line B E D, will produce a motion of three inches of the bubble; therefore a fecond will be I-20th of an inch, and may be determined to the greatelt precifion. For common purpofes, the bubble tubes have a much more rapid curvature, and are proportionably lefs fenfible, which is very proper, becaufe the bubbles of fuch delicate levels can never, in common ufe, be brought to fland at all fteady, from the bending of the floors, and tremors of the fupports they are applied to. The application of the bubble tube has been thewn in numerous inftances in the articles above-mentioned; but the inftrument denominated the fpirit-level, for furveying, remains to be defcribed here. The moft fimple form is a ruler of brafs, having a bubble tube fixed down upon the middle of it ; at each end of the ruler a fight is erected, through which the obferver views any diftant object, whofe level is to be afcertained. This inflrument is fitted upon a fupport with three legs, and has a ball and focket, by which the ruler and fights can be turned about in all directions, until the bubble fhews it to be horizontal. The inftrument in this form, which is the original, is fo extremely inconvemient for ufe, that it is totally unfit for the delicate obfervations neceffary for fetting out canals, and other works, where the conveyance of water is concerned, and is therefore but very little ufed, except in levelling for roads, where an error is of light importance. After having deferibed fome progreflive improvements in this inftrument, we fhall proceed to the defcription of the level with telefcopic fights, which is univerfally employed for the above purpofes.

The air-level, with fights, is an improvement of the fimple airlevel already defcribed; which, by the addition of more apparatus, becomes more commodions and exact.

It confilts of an air-level (Plate VI. Surveying, fig. 1.) about eight inches long, and feven or eight inclies in diameter, fet in a brafs tube, with an aperture in the middle. The tubes are carried in a ttrong, flraight ruler, a foot long, at whofe ends are fixed two fights, exactly perpendicular to the tubes, and of an equal height, having a fquare hole, formed by two fillets of brafs, crofing each other at right angles; in the middle whereof is drilled a very little hole, through which a point on a level with the inftrument is defcribed. The brafs tube is faftened on the ruler by means of two fcrews; one whereof, marked 4 , ferves to raife or deprefs the tube at pleafure, for bringing it towards the level. The top of the ball, and focket is rivetted to a little ruler that fprings; one end whereof is. fattened with ferews. to the great ruler, and the other end has a fcrew 5, ferving to raife and deprefs the inftrument, when nearly level.

This inftrument is yet lefs commodious than the following one, becaufe, though the holes be ever fo fmall, yet
they will Atll take in too great a face to detcrmine the point of level precifely.

Level', Air, with telefopic fighis. This level, reprefented in Plate VI. Surveging, fig: 2, is like the latt; with this difference, that, initead of plain fights, it carries a telefcope, to determine exactly a point of level at a good diftance.

The telefcope is in a little brafs tube, about fifteen inches long, fattened on the fame rule as the level. At the end of the tube of the telefcope marked 1, enters the little tube 1, carrying the eye-glafs and a hair horizontally placed in the focus of the object-glafs 2 ; which little tube may be drawn. out, or pufhed into the great one, for adjufting the telefcope to different fights. At the other end of the telefcope is placed the object-glafs; the fcrew 3 is for raifing or lowering the little fork carrying the hair, and malsing it agree with the bubble of air when the inftrument is level; and the fcrew 4 is for making the bubble of air agree with the telefcope. The whole is fitted to a baill and focket.
M. Huygens is faid to have been the inventor of this level; which has this advantage, that it may be inverted, by turning the ruler and telefcope half round; and if then, the hair cut the fame point that it did before the turn, it is a proof the operation is juft.

It may be obferved, that one may ald a telefcope to any kind of level, by applying it upon, or parallel to, the hafe, or ruler, when there is occafion to take the level of remote objects.

For the method of adapting al level to the meridian telefcope, fee Telyscore.

Mr. Hadley has contrived a fpirit-level to be fixed to a quadrant for taking a meridional alitude at fea, when the horizon is not vifble. See the defcription and figure of it in the Phil. Tranf. $\mathrm{N}^{\circ} 430, \mathrm{p} .167,8 \mathrm{cc}$. or Martyn's Abridg. vol. viii. p. 358 , \&c. See alfo the method of preparing and ufing a water leveh, and a mercurial level, annexed to Davis's quadrant, for the fame purpofe, by MiLeigh, in Phil. Tranf. N $45^{\text {I }}$. p. 413 or Abr. vol. viii. p. 360 , \&c.

Level of M. Hay'sens's Invension confifts of a telefcopes, a, (Plate VI. Surveriug, fis. 3.) in form of a cylinder: going through a ferril, in which it is faftened by the middle. $T h i s ~ f e r r i l ~ h a s ~ t w o ~ f l a t ~ b r a a c h e s, ~ b . ~ b, ~ o n e ~ a b o v e ~ a n d ~ t h e ~$ other below ; at the ends of which are faftened little moving: pieces, which carry two rings, by one of which the telefcope is fufpended to a hook at the ead of the frew 3 ; and by the other, a pretty heavy weight is fufpended in order to keep the telefcope in equilibrio. This weight hangs in thebox 5 , which is almoft tilled with linfeed oil, oit of walnuts, or other matter that will not eably coagulate, for more aptly fetting the balance of the weight and telefrope. The inftrument carries two telefcopes, clofe and veny parallel to each other, the eye-glafs of the one being againit the ob; ject-glafs of the other, that one may fee each way withoit turning the level. In the focus of the object-glafs of each. telefcope, muft a little hair be ftrained horizontally, to be raifed or lowered as occafion requires, by a little fcrew. If the tube of the telefcope be not found level when fuff pended, a ferril or ring, 4 , is put on it, and is to be flid along till it \&xes to a level. The hook on which the initrument is hung, is fixed to a flat wooden crofs; at the ends of each arm of which there is a book, ferving to keep the telefcope from too much agitation in ufing, or in carriage a To the faid flat crofs is applied another hollow: crofs, that ferves as accafe for the initrument ; but the two ends-areleft open, that the telefcope may be fecured from the wea-

## LEVEL.

ther, and arways in a condition to ufe. The foot of this inftrument is a round brafs plate, to which are faltened three brais reerils, moveable by means of joints, whercin are put ftaves: and on this foot is placed the box.

In the portable fpirit-level, the tube is properly fet in brafs, and fixed by means of fcrews in a fmall brafs trough, the bottom of which is ground very ftraight. The fcrews are ufeful to place the bubble in fuch a pofition that the lower furface of the trough may be parallel to a tangent fuppofed to be applied to the middle point of the curve of the level. The adjut ment is effected without much difficulty, by placing the level on an adjuttable plane, and then reverfing it. If the bubble itand accurately in the fame pofition betwcen two marks made on the tube in both fituations of the level, it follows, that neither end of the plane nor of the lower furface of the frame of the level is elevated; or, in other words, that every furface to which the level may be applied, and on which the bubble tands in the pofition here mentioned, is horizontal.

This eafy praxis may be effected in various ways, according to the nature and figure of the inftrument of which the pofition is to be determined; but the accuracy of the refult will depend upon the fenlibility of the level; that is to fay, the fpace pafted over by the bubble for every minute or fecond of the quadrant, and the certainty with which, under circumftances precifely fimilar, it fhall arrive at the fame pofition. In the belt levels the curve muit be circular ; for in fuch the bubble will move with more activity, fettle itfelf with more certainty, and defcribe equal fpaces by equal changes of inchnation. An ordinary good Cpirit-level will exhibit a movement of upwards of half an inch for each minute of inclivation, and alter the pofition of its bubble by a change of five feconds, or lefs. In fuch a tube the radius of the curve will be about 150 feet. But extraordinary levels are much more delicate. De Lalande fpeaks of a level filled with ether, the bubble of which paffed over fourteen inches by equal fpaces of one-tenth of an inch for every fecond. The radius of this curve was confequently 1719 feet; or near one-third of a mile.

The tubes of fpirit-levels are felected by trial. If a long piece of tube be uearly filled with ardent fpirit, and corked at the end, the run of the bubble may be tried with a fuitable inftrument called the level-trier, throughout the whole length on all fides. By this means it may be known whether, and in what parts, it may be defirable to divide the tube for the purpofes of filling and clofing. It is remarkable that thefe tubes in general prove either good thoughout, or good for nothing; for it feldom happens, where one good level can be taken, that the remainder is unferviceable. A refpectable mathematical inftrumentmaker affures us, that he finds it a good practice to go to the glafs-houfe and caufe the tubes to be drawn without fuffering them to be turned round.

But the molt regular and accurate levels are obtained by grinding the infide of the tube. For this purpofe, a cylindrical piece of wood is turned fo as to go eafily through the portion of tube intended to be ground. It is then worked in the tube with water and fine emery in the ufual way. As foon as the polifh has by this means difappeared on one fide, the tube is cleaned, filled, and tried; and accordingly as its figure proves to be more or lefs ftraight or curved, the granding is either repeated or difcontinued. Some operators polifh the infide again after grinding; but this has not been found to increafe their fenfibility:

From the great delicacy of the fpirit-level, compared with the few obfervations here prefented on the plumb-line,
the former inftrument may appear greatly to deferve the preference. Aftronomers are not however agreed on this point. When a fpirit-level is adjulted by reverling, at a certain temperature, and both ends of the bubble marked, it may be allowed that the inftrument may be fucceffully applied to ufe. But if the temperature be raifed, the fpirit will expand, ard of courfe the bubble will become fhorter. Whence it appears neceflary that a divifion and adjulting piece fhould be applied, from experiment, to afcertain the true ftation of the bubble at different temperatures; and even this application feems fcarcely adcquate to fupply the place of repeated adjutlments. The variation of the bubble will differ according to the quantity of fpirit contained in the tube. In two grod levels, of nearly the fame magnitude and figure, we found it amount to oncfifth of an iuch for every ten degrees of Fahrenleit. The bubble therefore may be one inch longer in winter than in fummer, which in thefe individual levels amounts to near one-third of the fummer length. The curvature of a fpirit-level will alfo vary from unequal temperature; fuch, for example, as may arife from one end of the tube being touched or breathed upon, while the other end is left at the original temperature. The error from each of thefe caufes may amount to feveral minutes, as is eafily fhewn by trial ; but we do not find that the prefence or abfence of funflime caufes any perceptible difference. It is probable that the rays may not \{peedily alter the temperature, on account of the tranfparency. And with regard to thefe three latt fources of error, it muft be allowed that they are eafy to be avoided, and indeed not likely to be prefent in the operations of accurate obfervers.

We have, in Plate V. Surveying, given figures of two levels by the moft celebrated makers, the late Mr. Jeffe Ramiden, and another by Mr. Troughton: of the former, A B, fg. 3 , is the telefcope, having the fpirit-level C D fitted in a brafs tube, fixed benearh it. The telefcope is fupported at its ends by refting on angular notches in two pieces of brafs, Y I, Y 2, called the zyyes, from their refemblance to that letter. It is keld in the angles of the wyes by a clip $r$ r, fhutting down over each and pinned faft. The wyes are fupported on a brals bar E E, the middle of which has a large circular aperture in it, to receive a compafs needle. A bottor plate $a \mathfrak{a}$, being forewed under this aperture in the bar, and a glafs cover fitted over it, forms the compals-box $F$, in which the magnetic needle turns round. The bottom $a$ a of the compafs-box has a long axis faltened to it, which is fitted into the dome of the circular plate G, and alfo pafies through a \{pherical ball, fhewn by the dotted lines to be fcrewed faft to the underfide of the dome of the plate. Upon this axis, the telefcope-level and compafs-box turn round horizontally: the ball, jult mentioned, is received in a correfponding cavity in the focket R , which is part of the plate H. By this ball and focket the two plates G and H are united, but not confined to be parallel, though they are called the parallel plates. Four fcrews (two of which are feen at I K) pafs through the plate H , and their heads fupport the plate G, which can, by means of them, be placed horizontal, (and confequently the axis fixed in it vertical,) though the lower plate is not horizontal, which will depend upon accident, as it is fupported on three legs fet on the ground, and may therefore partake of its inclination. The legs are not fhewn in fog. 1, but are the fame as thofe feen in fig. 3 , at LMN: they are all jointed into the fame piece of brafs $O$, which has a large fcrew on the top of it, entering a female fcrew in the interior of the projecting part R, fig. 3, of the plate H. When ${ }_{4} \mathrm{H}_{2}$
shut

## LEVEL.

Ghut up, the three legs form one round flaff, and are fecured for carriage by rings put on them: when opened out, they make a very firm ftand on the ground, though it be ever fo uncren. Thefe being the chief parts of the inftrument, we have wily to notice the contrivances for adjulting every part to perform accurately. The mill-headed nut $d$, at the top of the telefcope, being turned, thrufts forth a tube e, contained within the external tube of the telefoope, and carrying the object glafs, which is by this means adjufted to its focal ditance, fo as to fee an objeet diftinelly at any diftance. The telefcope has two wires in the eyeend at $f g$ croffing each other perpendicularly: it is by interfecting thefe the object is viewed. The eye-piece, $L$, of the telefcope flides in its tube to adjut the focal dittance of the eye-glaftes. That thefe wires may be feen diftinctly, the lesel is fufpended from the telefcope at one end by a ferew D, which adjuits it parallcl to the axis or line of fight of the telefcope. At the oppofite end $\mathbb{C}$ is another fcrew adjutment, to make it parallel in the direction fideways, that is, in the fame veritcal plane with the axis of the telefcope. The $\mathrm{Y} \mathbf{z}$ is fupported in a focket M, and can be raifed or lowered by the ferew N , to make the level and telefcope truly perpendicular to the vertical axis reprefented by the dotted lines. The forew $O$ is for turning the axis about to direct the telefcope to any object: it operates upon a ring or clump of brafs P , which enclofes, and is fixed to, the axis when the icrew $S$ is turned, but when this fcrew is flack, the clump telcafes the axis, that the telefcope may be turned round readily, to bring the defircd object into the field of view: then by ferewing S the telefcope is made falt, but may ftill be turned a fmall quantity by the forew O to direct it exaetly to the object.

The compals contained in the bar E E is for taking bearings of any olject; but as its ufe is not connected with the operations of levelling, and has been fully defcribed under the articie Circumferentor, we refer to that article.

Previous to taking any levels by this inferument, the adjuitments fhould ali be verified by the obferver; for though they are ever fo accurately done by the maker, they are not to be depended upon after the inftrument has been carried about, or ufed; and for this reafon they are all fo contrived, as to be done with care in the open air. The procefs is as follows: open the three legs, and fet them firmly upon the ground, placing the parallel plates G and H as nearly horizontal as can be gueffec.

IIt. Adjuft the level C D to be parallel to the telefcope in the following manner: Open the clips $r, r$, which confine the telefcupe in the wyes, and turn the fcrew N till the bubble comes into the middle, as is fhewn by two fcratches on the glafs tube. Now lift the telefcope gently out of the wyes, and reverfe or turn it end for end, and if the bubble flands where it did before, all is right; if it goes to either end, obferve how much it is from the centre, and by turning the fcrew N deprefs the end towards which the bubble runs, (or, what has the fame effect, elevate the other end,) until the bubble returns oue-half the quantity of its error. Now by the fcrew D alter the level the other half the error ; if thefe halves were correctly ellimated, it will be right, as is proved by the bubble flanding right on returning the telefcope to its original pofition. If not right now, the adjultment mult be repeated till the bubble tands right either way, which proves the level and the telefcope to be exactly parallel ; the two cylindrical parts of the telefcope, where the wyes receive it, being made precifely the fame diameter.

2dly. To make the crofs-wires in the telefoope interfeat eactr other in the axis or line of collimation thercof.- The eye-piece L being drawn out to fee the wires diftinctly, direct the telefcope to any dittant object, and by the nut $d$ adjuft the focal diftance to fee it clearly: felect fome flraight line in the diftant object, as the fide of a window, \&c. Then by the fcrews N or O , one elevating the telefcope, the other moving it fideways, and by turning the telefcope in its wyes, bring one of the crofs-wires to coincide with the Atraight line of the diftant object, without regarding the level. Now turn the telefcope half round on its own axis, as it lies in the wyes; and if the crofs-wire is truly in the axis it will not appear to have changed its pofition; but if it has, the wire mult be moved, by turning an oppofite hair of the four fcrews at $f g$ : by thefe move the wire acrofs the field of view one-half of the error, and by the fcrews N or O turn the telefcope back the other half. The other wire is now done in the fame manner, by obferving its coincidence with a diftant object, and then turning the telefcope half round on its own axis; and both wires may be proved by obferving a fmall object, as a circular chalk mark, \&c., to be in the interfection of hoth wires; and turning the tube round on its axis, it will, if right, appear in the interfection in all pofitions. The inftrument is now prepared for taking levels in the manner explained under Levelline; and, if carefully ufed, need not be re-adjufted for many days.

The level above defcribed, is that which is in the moot general ufe, great numbers having been made by Mr. Ramfden, and fince his deceafe by his numerous pupils. It is certainly an excellent inftrument in the hands of thofe who are ready and expert in the manupilation of the adjuftments jult defcribed, and who are caretul to repeat them when necefflary.

The initrument delineated in fog. 4. has lately been brought forwards by Mr. Edward Troughton. Its contruction is fo compact, that the parts are little liable to derangement, and therefore do not need fo many provifions for adjufting, by which the inflrument is fimplified and rendered more portable. $A B$ is the telefcope, and $D E$ the lesel ; its brafs tube being partly received into the telefcope, and foldered falt thereto, fo as to be in no danger of altering its pofition: the telefcope is fcrewed to a ftrong brals bar FF, which fcrews faft to the top of a conical focket $G$, that turns upon a vertical axis faftened to the plate H : this is united to the lower plate I by a ball and focket, and the four fcrews fcrewing through the upper plate, and refting on the lower, give the means of always fetting the axis vertical : the joints $O$ for the three legs $L, M, N$, are fixed to the lower fide of the plate H : the compafs-box $P$ is fupported over the level by four fmall pillars; by this means it is more readily obferved than when beneath, and gives the means of laying the telefcope fo clofe to the brais bar F, that it is much more firm than the former inftrument. The bubble of the level is fo long, that its ends appear on both fides of the compafs-box, and is fhewn to be in the middle by feratches on the glafs at $a b$, as ufual.
The fcrews which hold the telefcope to the plate $\mathbf{F}$ are covered by caps of brafs, which defend them from accidentai alteration, but admit their adjuftment when neceffary. To make the tclefcope exactly perpendicular to the vertical axis, the only adjuftment the infrument requires befides this is the eye-piece. It has, in heu of cro's-wires, a fimall micrometer or divided fcale, of mother-of-pearl, fixed perpendicularly a arofs the field of view, the divided edge interfecting the line of collimation : the central divifion of the

## LEVEL

fcale hias a fmall hole through it for diftinction. It is this by which the levels of objects are obferved, and it therefore crofles the axis of the telefcope. It can be adjuited exattly to this by a forew $d$ at top, and another $e$ beneath the tube. The manner of adjufting this inftrument is as follows: the legs being fet on firm ground, the vertical axis is adjufted, in the fame manner as every other level is preparatory to making obfervations, viz. by fetting the telefcope over any oppofite two of the four ferews in the parallicl plates, and turning thefe fcrews, one in and the other out, till the bubble comes right; then turn it half round, by applying the finger and thumb to the large milled nut on the top of the focket G. If it is level when thus reverfed, all is right; if not, it fhews the level is not perpendicular to the axis, and one-half the error mult be corrected by the fcrews under the ends of F , and the other half by the fcrews of the parallel plates, the telefcope being turned over the other pair of fcrews; and they are adjufted in the fame mnanner. Now the axis is vertical, as is fhewn by the bubble flanding ftill while the telefcope is turned all round. The plate F, being once adjufted in this manner, will not foon be deranged, and when it is will immediately difcover itfelf, and be as eafily rettored. The line of fight, or line of collimation of the telefcope, is made parallel to the level, by an actual trial in the field, which indeed is the molt accurate method, and is reforted to for very delicate purpofes. in the inftrument before defcribed, to verify the adjuftments after making them, the method of trial is applicable to a level of any kind, and is defcribed under Leveling. .The micrometer fcale in the eye-piece is very ufeful in levelling; it gives the means of roughly eftimating equal diftances from the inftrument in any direction. A man who attends the obferver holds up a ftaff of tix feet, or any other length, perpendicular, and the oblerver, looking at it through the telefcope, notices how many divifions of the micrometer fcale the ftaff appears to fubsend; then, if the man recedes from the inltument until the fane flaff reaches the fame number of divifions, he will be at the fame diltance from the inftrument. This property is extremely convenient in many inftances which occur in the ufe of a level.
Level, American, is an inttrument which is formed of two pieces of thin wood of equal length, joined together at top, and connected below by a crofs bar ; from the angle at top a lead plummet is fuspended by a fmall cord, which, when the inilrument itands level on both legs, trikes upon a mark in the centre of the comecting bar, as reprefented by iz, fig. 4. in Plate VI. Surveging. The manner of ufing it is fimply this: At the place from which the level is to be taken, drive a wooden peg in the ground, clofe in to the top, upon which one of the legs of the frame may rett; then bringinis round the other leg till it touch the ground, there drive in a fecond peg, turning round the other leg as before; and where it touches the ground again, drive in another peg, and fo on along the whole line to be levelled. Thus, with very little trouble, and with as much accuracy as with the fine!! fpirit-level, will the courfe of the drain be eafily afcertained. But as it is neceffary the drain fhould have as much declivity as to allow the water to run freely, it will be requifite, in taking the level, to regulate the directhon of the line accordingly. Half an inch fall in the length of the frame will be fufficient, and fometimes even lefs. For this purpofe, it will be expedient to have, befides a number of wooden pegs, one iron pin, with inches and halves marked regularly upon the fides of it from the top downwards. After having drove in the firlt wooden peg at the point from whence you mean to conduct the drain, and
having refted the one leg of the frame upon it, turn round the other till it be level with the firlt peg; there put in the iron pin, fo that this leg of the frame may reft on the top of it when level; then drive in a wooden peg fo far, as that the top of it may be half an inch lower than that of the iron pin. Place the leg of the frame again upon this fecond peg, curn it round to a level, putting in the iron pin till the top of it be equal with the foot of the frame; then drive in another wooden peg clofe by the fide of it, till the top of the wooden one be half an inch lower than that of the iren pin. Proceed in this manner fo far as you mean to carry the drain, which will have the fame degree of declivity all the way along. is line thus fet off is narked from $c$ to $d$ in the figure. When made on a fmaller feale, it is ufcful in afcertaining the proper defcent along the bottom of a drain, while the workmen are laying it; but when made for this purpofe, the crofs bar mult be fixed to the bottom of the legs, as marked with dotted lmes in the plate.

There is a watering level which is much ufed in fome places, which is formed of different pieces of wood, \&c.; the ufual length given it being five feet and a half, and the height from four feet to four feet and a h.lf, according to the height of the perfon who is to make ufe of it.

The oljed ffaff, fig . 5, Plate V I. Surveying, fhould be madee exactly of the iame height with the level. The crofe piece, fig. 6, fhould be fufficiently large to be feen diltinctly at a diftance, and muft be painted white for the purpofe.
This level, in the experience of Mr. Marinall, has been found " preferable to any other level now in ufe, as being equally accurate in afcertaining the relative heights of diftant objects, as in minutely tracing itep by ftep the required line of communication, fo as to give cvery part of it an equal and uniform defcent." In its ufe in fetting out a level, to as to fix the fall accurately at one inch, foot, or yard, in a hundred of any of them, on the face of the level, which is found in general to be the moft proper; ; it is directed to meafure out one hundred fect on level grourd, placing the level at one end, the object-ftaff at the other, and then adjulting their tops to a dead level, by a dead level line exaetly drawn on the face of the implement (viz a line drawn at right angles with the upper edge of the top rail,) as fhewn at $a$, in the $\mathrm{fi}_{f}$ ure, then meafuring one foot downward onthe ftaff, and there holding a rule or other ftraight edge level acrofs the flaff; bringing the top of the level, by railing its binder foot, to range accurately with the upper fide of the rule, and while they remain at relt in this pofition, a mark mult be made where the plummet-line refts againt the face of the level. After this meafure out a hundred yards, and proceed in the fame manner, in order to prove or rectify the firt mark, on which a permanent line muft be funk on the face of the level $b$, in the figure, which in water-work is better than the plumb-line. Where the ground to which the water is to be conducted can be feen from the place whence it is to be taken, the flaff fliould be fet upon the higheft part to which it is defirable to raife ?e water, and the level at the fource, and after having correctly adjufted the top of the latter to that of the former mark, where the plummet relts on the face of the level, where it refts between $a$ and $b$, it is neceffary to confider the cafe, as, where the extent of land is frall, and that of the water unlimited, litile fall may be fufficient ; but in the contrary circumftances, it would be improper to let it wafte by the way more than is neceffary; of courfe where the plummet relts much within the water-line, the ftaff muft be moved and fet lower down on the flope till the requifite fall is gained. But where the plummet is found to rell on the $\begin{gathered}\text { righto }\end{gathered}$
right-hand fide of the water-line, mark the plan and draw a pencil line, (which will be fufficiently durable for a fingle work, and may afterwards be eatily rubbed out on the face of the level,) correfponding to the line of the plummet, as the dotted line $c$, and thus fix the fall in this cafe, always making due allowance, in tracing and ftaking out the line with the level thus fet, for the crookednefs of the courfe; as from this lengthening the line, the declination of the channel is proportiunally leffened.
It is fuppofed further, that "many ingenious additions" might be made to this level; but that "they would be injurious to its prefent fimplicity." Any country carpenter maty be eafily inftru\{ted to conftruct it in its prefent form, and " any common labourer be eafily taught to ufe it, either in forming roads or water-courfes." It is, however, beft adapted to the latter ufe.

Dr. Defaguliers contrived an infrument, by which the difference of level of two places, which could not be taken in lefs than four or five days with the beft telefcope levels, may be taker in as few hours. The infirument is as follows:

To the ball C (Plate VI. Survejing, fis. 7.) is joined a securved tube $\mathrm{B}-\mathrm{A}$, of a very fine bore, with a fmall bubble at the top A, whofe upper part is open. From the conftruction of this intrument, it is evident, that if it be inclined in carrying, no prejudice will be done to the liquer, which will always be right both in the ball and the tube, when the inllrument is fet upright. If the air at C be fo rexpanded by heat, as to drive the liquor to the top of the tube, the cavity A will receive the liquor, which will come down again, and fettle at D , or near it, according to the level of the place where the intrument is, as foon as the air at C returns to the fame temperament as to heat and cold. For preferving the fame degree of heat, when the different obfervations are made, the machine is fixed in a tin-veffel, EF, filled with water up to $g h$, above the ball, and a very fenfible thermometer has alfo its ball under water, that one may obferve the liquor at D , in each experiment, when the liquor in the thermometer ftands at the fame height as before The water is poured out when the inftrument is carried, which may be done conveniently by means of the wooden frame (fig. S.), which is fet upright by three ferews, $\mathrm{S}, \mathrm{S}, \mathrm{S}$, and a line and plummet P P (fig.9.) At the back part of the wooden frame (fig. 10.) from the piece at top, K, hangs the plummet $P$, over the brafs point at $N$. $\mathrm{M}, m$, are brackets for keeping the upright board, K N , at right angles with the horizontal one at N. The machine feen in front is reprefented fir. 11 , fuppofing the fore-part .of the tin veffel tranfparent; and here the brafs focket of the recurved tube, into which the ball is fcrewed, has two wings at II, fixed to the bottom, that the ball may not break the tube by its endeavour to emerge, when the water is poured in as high as $g h$.

After Dr. Defaguliers had contrived this machine, he contidered, that as the tube is of a very fmall bore, if the liquor thould rife into the ball at A (fig. 7.) in carrying the initrument from one place to another, fome of it would adhere to the fides of the ball A , and upon its defcent in making the experiment, fo much might be left behind, that the liquor would not be high enough at D to thew the difference of the level; therefore, to prevent that inconveniency, he contrived a blank fcrew, to fhut up the hole at A, as foon as one experiment is made, that in carrying the machine, the air in A may balance that in C, fo that the liquor fhall not run up and down the tube, whatever degree of heat and cold may act upon the inftrument, in going
from one plase to another. Now becaufe one experiment may be made in the morning, and the water may be fo cold, that when a fecond experiment is made at noon, the water cannot be brought to the fame degree of cold it had in the morning ; therefore, in making the firlt experiment, warm water muft be mixed with the cold, and when the water has ftood fome time before it comes to be as. cold as it is likely to be at the warmelt part of that day, obferve and fet down the degree of the thermometer at which the fixit dtands. and likewife the degree of the water in the barometer at D ; then forew on the cap at A, pour out the water, and carry the inftrument to the place whofe level you would know; then pour in your water, and when the thermometer is come to the fame degree as before, open the forew at top, and obferve the liquor in the barometer:

The doctor's fcale for the barometer is ten inches long, and divided into tenths; fo that fuch an inftrument will ferve for any heights not exceeding ten feet, each tenth of: an inch anfwering to a foot in height.
The doctor made no allowance for the decreafe of denfity in the air, becaufe he did not propofe this machine for meafuring mountains (though with a proper allowance for the decreafing denfity of the air, it will do very well,) but for heights to be known in gardens, plantations, and the conveyance of water; where an experiment that anfwers to two or three feet in a diftance of twenty miles, will render this a very ufeful inttrument. Defaguliers's Exp. Phil, vol. ii.' p. 372, \&c.

Level is a term uled to denote a length or pound of a canal, and alfo the adit or fough to a mine or engine-pit.

Level-pegs, are fmall flakes ufed in levelling out an in. tended canal; and they are ufually placed at the level of the top bank, as at d, Plate I. Canals, fr. 7 and 8.

LEVELLING, the art or act of finding a line paralle! to the horizon, at one or more ftations, in order to deter. mine the height of one place with refpect to another ; for the laying grounds even, regulating defcents, draining moraffes, conducting waters, for the irrigation of land, \&c.

The firit procefs, preparatory to taking any levels, is to prove the correctnefs of the inftrument you employ for that purpofe. Some inflruments are contrived to prove themfelves, as defcribed in Level; but others require an actual trial in the field, which is a general method, and applicable to a level of any kind. If the level is made with plain fights, the proof is very fimple: firft fet it level, and obferve fome dittant object ; then turn the level, end for end, and obferve the fame object through the other fight. If it is the fame bothways, all is right; if not, the level mult be altered one-half of the error thus difcovered, which is doubled by this method of trial. For inflance, if the line of fight pointed down the firlt time, it will point as much upwards when ufed at the osther end. A level with :i telefcope cannot be ufed at either end, and there fore this method is inadmiffible, and the following may be adopted.
Choofe a fpot of ground where it is tolerably level for about twenty chains; fet up the inftrument at the point B, fig. I. Plate VII. Surveging, and, levelling the telefcope by the paralliel plates, that the bubble will ftand while it is turned all round, direct the telefcope to a target held up by an affiftant, upon a take driven in the ground at D , at 20 chains diftant. Your affiftant mult, according to your fignals, elevate or deprefs the vane of the target, till it appears in the interfection of the crofs wires; now meafure and write down the height $\mathrm{B} b$ of the centre of the telefcope above a ftake driven into the ground at B, fuppofe it four feet; and alfo write down the height $\mathrm{D} d$ at which the vane of the tar-

## LEVELLING.

get flands, whicit fuppofe fix fect "the difference between them, two feet, fhews that $B$ is two feet higher than $D$; but the line $b l$, being a tangent to the carth's furface at the point $B$, will be the apparent level; and the true level will be found, by deducting the allowance for 30 chains, fhewn by the table of the earth's curvature to be . 041 of a foot. Making, therefore, the true difference of level bet ween B and D to be I 959 feet, to prove this, level it the other way, removing the inltrument to D , and the target to the fake at B. Obferve in the fame manner as before, and if it gives the fame difference of level as before, after deducting the allowance, the initrument is correct; if, on the other hand, the refults by the two miethods do not prove the fame, take half the difference between the two, and elevate or deprefs the target that quantity, according as the lait obfervation was greater or lefs than the firlt, and adjult the initrument, either by the fcrew under the level, or the fcrews of the crofs wires, until they appear to cut the vane of the target fo corrected, when the bubble is in the middle. The inftrument is now corrected, but the trial thould bc repeated to make it certain.

The following method of adjufting a fpirit-level is rather preferable, as it does not require the inftrument to be removed; but it is only applicable to thofe inftruments where the telefcope lies in wyes, and can be removed. Set up the level, as at A in fre 2, fo that you can fee both ways for about soo yards; fix up a thaff in each direction at B and C, 100 yards diftant, fo that the two thaves and the telefcope are in a line. Now give your affiltant two circular pieces of card, about twice the diameter of the telefcope where it lies in the wyes, with altole through the centre cE each, large enough to receive the tube of the ere-piece of the telefcope; now level the telefcope, and your affirtiant applies one of the cards againft one of the flaves, $B$ for inftance, and moves it up and down, till its centre appears to the obferver to interfect the wires. The affiltant now faftens it to the ftaff at $a$, by two pins, baut fo that the centre hole can be feen clear through by the fide of the flaff. The telefcope is now turned half round, and directed to the other ftaf C , which is fitted with a card at $b$, the fame as the former. This being done without ailturbing the inflrument, take the telefcope out of its wyes, and Gut diown the clips again; caray the telefcope to one of the ftaves $D_{\text {, and applying its eye-piece to the hole }}$ in the centre of the card at $a$, direct the telefcope to the wyes of the level, and, looking through them, if the card 3 . on the diftant flaff $C$ appears to fit in the wyes, the level is proved correct ; if it does not, mark the flace where the card $a_{i}$ is fixed to the ftaff: $B$, unpin it, and flide it up or down, till the dittant card appears to fit in the wyes. Mark this polition of the card, rize at $d$, and pin it on in its firlt polition; repeat this operation at the ftaff C , and the card 4, will be removed to E. 'The figure explains the principle of this procefs: in the firlt operation the teiffonpe fet out the inclined line A $a$, inflead: of a horizontal line; the next operation was obferving the inclined line A ts; the third operation at the ftaff B formed a continuation of the inclined line $b . \mathrm{A}$ to $d$; and the fourth operation continued $a \mathrm{~A}$ as far as $e$ in this dtate it is evident, if the fpaces $a, d ; b ; c_{3}$ each of which are double the error of the inftrument, are divided into two equal parts at the points $f$, $g$, that the line $f \mathrm{~A} g$, will be truly horizontal, and the inftrument may be adjufted by the fcrews under the level, fo as to poiat to $f$ or $g$ when the bukble is in the middle.

One place is faid to be higher than another, or out of level with it, when it is more remote from the centre of the aarth; and a line equally diftant from the centre of it in
all its points, is called the fine of true kevel : whence, becaufe the earth is round, that line naut be a curve, and make a part of the earth's circumference, or an arc concentrical with it, as the line BC FF G, Plate VII. Surveying, fig. 3, all the points whereof are equally diftant from the centre of the earth A .

But the line of fight, which the operations of levels give, is a tangent, or a right line perpendicular to the femi diameter of the earth; one extreme of which tangent being the point of contact, the other will be that of a fecant drawn from the centre of the earth : and the point which determines it, will be above the furface of the earth, and of the true level, as much as that fecant exceeds the radius, or femidiameter of the earth.

This extremity of the tangent is faid to be in the apparent level, as being that given by the fight ; but is eafily reduced to the true level, becaufe we know-by trigonometry, how much each fecant exceeds the radius; and becaufe by meafuring, we have difcovered the precife length of that radius. Or, fince the apparent level between the places B and C is $B D$, and the true level is the arc BC ; it is plain that the former rifes above the latter by the line C D. But by a well known property of the circle $\overline{2 \mathrm{AC}+\mathrm{CD}} \times \mathrm{CD}=$ $\mathrm{BD} \mathrm{D}^{2}$, and the diameter of the earth being fo great with refpect to the line C D at all diltances to which the operation of levelling commonly extends, that 2 AC may be fafely taken for $2 \mathrm{AC}+\mathrm{CD}$ without any fenfible error, we fhall have $=A C \times C D=B D^{2}$, and $C D=\frac{B D^{2}}{2 A C^{\prime} \text {, i.e. the differ. }}$ ence between the true and apparent level is equal to the fquare of the diftance between the places divided by the diameter of the earth, or the rife of the apparent above the true level is proportional to the \{quare of the diftance. It was for want of the knowledge of this, that the ancients were not able to reduce the apparent level'to the true one; and accordingly, to prevent falling into an error, never levelled above twenty feet at once, where fuch reduction was not neceffary.

By the table fince made, it appears, that at the dittance of 100 yards the apparent level is raifed above the true one about one-third of a line ; fo that the ancients, in this refpect, were mose fcrupulous than needful. By means of this reduction, we are now afle tor level diftances of one or two miles at a fingie operation, which the ancients could not.do in lefs than tiree hundred.

The following table, for fhewing the height of the appa: rent level above the true, was calculated by Mr. Fergufon, to the extent of a whole degree of a great circle on the earth's furface, and it agrees fo nearly with one of the fame. fort iut. Dr. Loag's Altronomy, as not to differ quite two inches from it at the end of the whole degree, which contains 60 geographical miles, equal to $69 \frac{1}{+}$ Englifh miles. The ufe of this table is as follows: If the quantity of an arc of a great circle on the earth's furface is given in minutes. or feconds of a degree, its meafure may bc found in feet and inches. Thus, fuppofe the are contains ter feconds, which is the fixth part of a geographical mile, its mearure is-1015. feet 8 inchas. So an arc of one minute of a degree, which is one geographical mile, contains 6094 feet, or 203.1 yards In foot; which is 271 yards i: foot longer than an Englifh mile. To find how far one can fee in a true horizon. (as at fea) when the eye is raifed to any given height above the horizon:. fuppofe the eye of an obferver upon a hhip at fea.to, be 23 feet two inches above the furface of the water, he will then fee $30,4 \%$ o feet all around him, or to the diftance of 5 geographical miles.

Suppofe:

## I.EVELLING.

Suppofe the top of a mountain in the fea to be feen at the ditance of 60 geographical miles, or one degree, by an obferver, whofe eje is clofe at the furface of the fea; the height of that mountain is 319 r feet 1 jinch, nearly, above the furface of the fea. An Englifh mile is 52 So feet, a geographical nuile 6094.

Suppofe a fpring to be on one fide of a hill, and an houfe on an oppofite hill, with a valley between them; and that the furing feen from the houfe appears, by a levelling inftrument, to be on a level with the foundation of the houle, and is a mile from it ; the apparent levelof the fpring is $10 \frac{6}{10}$ inches above the true level of the houfe: and this difference would be fufficient for the water to be brought in pipes from the fpring to the houfe; the pipes being laid all the way in the ground.
If the diffance of the object be greater than 60 minutes, or geographical miles, its height above the true level may be found thus. Suppofe an eye at the furface of the fea fees
the top of a mountain, which he knows to be 90 geographiscal miles, or a degree and a half dittant from him: take half that number of miles, and multiply the height of the apparent level above the true, anfivering to that half diftance, by 4 ; and the product will give the perpendicular height of 'that mountain. Thus, the half of 90 is 45 , againft which (in the table) ftands 1794 feet 11,763 inches; which being multiplied by 4 , gives 7179 feet 11 inches for the perpendicular height of the mountain above the level of the fea.

According to thefe meafures, the earth's circumference is ${ }^{131} 3^{1,630,400}$ feet, or 24,930 Englifh miles.

At the diftance of $I$ fecond of a degree (or $\frac{1}{6}$ th of a geographical mile) the height of the apparent level above the true is . 0029547 parts of an inch; at two feconds diftance it is four times as much; at three feconds, nine times; at four feconds, 16 times as much; and fo ort, always increafing in proportion to the fquare of the diftance.

A Table, flewing the Height of the apparent Level above the true, at any Difance within a Degree of a great Circle on the Earth's Surface; calculated to the $\mathbf{1} 000$ dth Part of an Inch.

Fergufon＇s Tables and Tracts，p．243，\＆c．See De－ pression of the Horizon．

The operation of levelling is as follows：Suppofe the height of the point A（Plate VII．Surveying，fig．4．），on the top of a mountain，above that of the point B ，and at the foot thereof，required：place the level about the middle difance，between the two points，as in D，and flaffs in A and B；and let there be perfons inftructed with fignals for raifing and lowering，on the faid ftaffs，little marks of pafte－ board，or other matter．The level being placed horizontally by the bubble，\＆cc．look towards the ftaff A F，and caufe the mark fo raifed to be lowered，till the middle，upper edge，or other moit confpicuous part，appear in the vifual ray．Then meafuring exactly the perpendicular beight of the point E，above the point A，which fuppofe 6 feet 4 inches，fet that down in your book：then turn the level horizontally about，that the eye－glafs of the telefcope may be ttill next the eye when you look the other way（if you have only plain fights，the inftrument need not be turned）； and caufe the perfon at the ftaff B to raife，or lower his mark，till fome confpicuous part of it fall in the vifual ray， as．at C ；then meafure the perpendicular height of C above B，which fuppofe 16 feet 8 inches；fet this alfo down in the book above the other number of the firf oblervation； fubtract the one from the other，the remainder will be 1o feet 4 inches，which is the difference of level between A and B，or the height of the point A above the point B．

Note，If the point D，where the inftrument is fixed，be in the middle between the two points A and B ，there will be no neceffity for reducing the apparent level to the true

Vos．XX．
level；the vifiual ray，in that cafe，being raifed equaily above the true level．
If it be farther required to know whether there be a fufficient defcent for conveying water from the fpring $\AA$ to the point B，Plate VII．Survering，fg．5－－Here，in re－ gard the diftance from $A$ to $B$ is conficerable，it is re－ quired that feveral operations be made．Having then chofen a proper place for the firft flation，as at I，fet up a ftaf in the point A ，near the － pring，with a proper mark to flide up and down the itaff，as $L$ ；and meafure the diftance from A to I，which fuppofe 2000 yards．Then the level being adjufted in the point $I$ ，let the mark $L$ be raifed and lowered till fuch time as you fpy fome confpicuous part of it through the telefcope，or fights of the level，and meafure the height A L，which fuppofe 13 feet 5 inches．But in regard the diftance A I is 2000 yards，you milt have recourfe to your table for a reduction，fubtracting ro inches 3 lines，which will leave the height AL， 12 feet 6 inches 9 lines；and this note down in your book．Now turn the level horizon－ tally about，fo as the eje－glafs of the telefcope may be towards the ftaff at $A$ ；and fixing up another ftaff at $H$ ， caufe the mark $G$ to be moved up and down，till you fpy fome confpicuous part through the telefcope，or fights． Meafure the height H G，which fuppofe 6 yards， 4 feet， 2 inches．Meafure likewife the diftance of the points $I, H$ ， which fuppofe 1300 yards；for which diftsnce，according to the table， 4 inches 3 lines mult be fubtracted from the height HG，which，confequently，will but leave 6 yards， 3 feet， 9 inches， 9 lines，to be taken down in your book．

This done，remove the level forwards to fome other emi－ 41
nence，

## LEVELLING.

wenec, as E, whence the faff H may be viewed; as alfo another ftaff at $D$, near the place whither the water is to be conveyed. The level being again adjufted in the point $\mathscr{E}$, look back to the itaff H ; and managing the mark as before, the vifual ray will give the point F. Meafure the height HF , which fuppofe in feet 6 inches. Meafure, likewife, the diftance HE, which fuppofe 1000 yards; for which ditance the table gives 2 inches, 5 lines of abatement; which being taken from the height if F , there will remain In feet, 3 inches, 7 lines, which enter in your book. Lattly, turwing the level to look at the next ftaff D , the vifual ray will give the point D. Meafure the height of D from the ground, which fuppofe 8 fect 3 inches. Meafure alfo the diftance from the itation E to $B$, which fuppofe 900 yards ; for which diftance the table gives 2 inches, I line of abatement ; which being taken from the height BD , there will remain 8 feet in lines, which enter as before.

For the manner of entering down obfervations in your book, obferve, that when a proper place or \#ation for the level, between the two points, has been pitched upon, you mult write down the two heights obferved at that ftation in two different columns, viz. under the firft column, thofe obferved in looking through the telefcope when the eye was from the fpring, or towards the point, which we may call back-fights; and under the fecond column thiofe obferved when the eye was next the fpring, which we call forefights, in the manner following:

Having fummed up the heights of each column feparately, fubtract the leffer from the greater, the remainder will be the difference of level between the points $A$ and D ; as in this example;

$$
\begin{aligned}
& \text { feet. inch. line. } \\
& 29: 10: 08 \\
& 23: 10: 04 \\
& \hline 6: 00: 04-\text { The difference of height, or leveI, } \\
& \text { between the points } \mathrm{A} \text { and } \mathrm{B} .
\end{aligned}
$$

If the diffance of the two points be required, add all the diftances meafured together; and dividing the difference of height by the yards of the diftances; for each 200 yards you will have a defcent of about 2 inches 9 lines. This problem may be otherwife folved in the following manner: let the line $f \mathbb{g}$, Plute VII. Surveying, fo. 6. repretent the line of fight of the telefcope drawn from $f$, the interfection of the crofs-lairs, through $g$ the centre of the object-glafs; and the points $b, b$, be the marks on the glafs tube, or \{pirit-level, $a b c$. While thefe parts of the inftrument are immutably fixed, with refpect to each other, it is manifeft, that as often as the air-bubble is exactly reduced to the marks $b, b$, the line of fight will be always reduced to the fane polition, with refpect to the horizon, or to a plumb-line. Nor is it at all neceflary, in the bufinefs of levelling, that the line of fight and plumb-line flould be exactly at right angles; but only that the angles they make fhall be always the fame. Let $p$ and $q$, fge $q$, be two given points in-two
remote places, and let it be required to find which is the lower, and how much. Let $p a$ and $q b$ reprefent two ftraight Itaffs, or poles, fixed upright by means of a plumbline. Having placed the telefeope by the fide of the pole $p a$, and directed the line of fight to the pole $q b$, alter its clevation by the fciew adapted to this purpofe, till the airbubble refts exactly at the marks upon the tube. Then let an alfittant nark the point $b$, which appears to be covered by the crofs-hairs; and alfo the point $a$ exactly upon a level with the crofs-hairs; which is eafily done by a common iquare applied to the fide of the pole $p a$. Then remove the telefcope to the pole $b q$, and here lct the fame things be repeated; that is, let $d$ be the place upon a level with the crofs-hairs, and $e$ the point upon the other pole $\beta, a$, that appears to be covered by them while the air-bubble relts at the fame mark as before. Bifect the interval $a c$ in $g$, and the interval $b d$ in $s$, and the points $g, b$, will be upor a level: that is, if we fuppofe $g p$ pqb to reprefent a long canal full of ftagnating water, the points $\delta, h$, will both be in its furface; and, confequently, taking the leffer depth $p g$ from the greater $q h$, their difference $q r$ fhews how much the point $q$ is below the point $p$ or $r$.

If the places $p, q$, cannot be feen from each other, or if the difference of their heights be greater than the length of any common poles, then one or more intermediate ftations mult be chofen; and by repeating the fame practice between. every two fucceffive flations, we fhall find the level of the extremes.

When the points $g, h$, are once found upon two polesinot far afunder, it will be convenient, by moving the crofs-hairs, to rectify the line of fight, fo as to be nearly coincident with the line $g h$, or with a line parallel to it, for then in future levellings, at greater diftances, the marks. $b, e$, will be-lefs. fubject to fall above or below the poles.

This reciprocal way of lewelling feems to be the moflexact of any, efpecially if it be performed by: two inftruments made to agree together before-hand; which may be done by placing them together, and by altering the crofs-hairs in cither of them, till the fame mark upon a remote objcet is covered by both the croffes, while both the bubbles reft at their marks upon the tubes. Then may two obfervers find the marks upon the oppolite poles at the fame time ; and confequently, the refractions of the rays in the air, whaterer be their quantities, will be equal as near as pofible : and then the refult of the practice will be as accurate as if there had been no, refractions at all. Fur let the curve bia, fis. 8 , reprefent the courfe of the vifual ray from $b$ to $a$; and let the lines $a k, b l$, touch it at $a$ and $b$. Then, becaufe the points $a, b$, are very nearly upon a level, the denfity and conftitution: of the air and vapours at the fame inftant wifl. be nearly the fame in each place; and by confequence the curve $a=2$ and its tangents at $a$ and $k$, will be equally in , clined to the chord $a b$. For the fame reafons the curve emd will be fimilar and equal to the curve aib, being fituated fo very near to it- Thercfore, the angle edtr, under the chord $e d$ and tangent $d n$, will be equal to the angle $a b l$, or $b a k$; and, confequently, fince the angles $q d n_{0}$ $p^{a k}$, are made equal in the two obfervations, by taking away the equal angles edin, $b a k$, caufed by the equal refractions, the remaining angles $q d e, p a b$, will be equal to each other, as if there were no refractions at all.

If the reciprocal obfervations be made about the middle of the fame day, when the air is the purctt, there will fcarcely be any occation for two inltruments: but if they be made near the morning or evening, even on the fame day, an equality of refractions cannot be depended upon, unlefs they

## LEVELLING.

are made at the fame intant. The members of the Royal Academy of Sciences at Paris tell us, in their Account of the Meafure of the Earth, they often found that an object, which at break of day appeared in the level, and fometimes a little above it, did afterwards, when the fun was up, appear below it. And, on the contrary, after the fetting of the fun, objects far dittant appeared to be raifed fo fenfibly, that in lefs thaa half an hour their apparent height was augmented more than three minutes. As to the caufe of thefe ap. pearances, they add, that the coolnefs of the night condenfes the vapours, which defcend to a lower place, leaving the air in the ligher itations more pure than in the day time. And on the contrary, when the heat of the fun has made a part of the vapours to mount to more elevated fations, there mult he lefs difference of the mediums, and confequently a lefs refraction.

Setting afide the curvity of a ray, which Mr. Picard tells us is fcarcely fenfible about noon, when the diftance of the object does not exceed 1000 toifes, the line of fight through the telefcope may be fet perpendicular to a plumbline, or parallel to the horizon, in this manner. Having found two points $g$, $h$, fig. 9 , upon a level as before, let $g i$ be perpendicular to $g c$, and gut $c b$ in $i$, and having computed the line $k i$ (as follows), and made a mark at it, place the level at $g$, and alter the place of the crofs-liairs in the focus, till they appear to cover the point $i$, when the air-bubble is at its marks, and the bufinefs is done. Now the line $b i$ is equal to the fquare of $g b$ applied to $2 g t$, and, confequently, may be found by meafuring the dittance $g h$, and dividing its fquare by the diameter of the earth, which may be fuppofed equal to $2 g \varepsilon$, though it is not exactly fo, the earth being not exactly fpherical. For bifecting $g b$ in $k$, draw $c k$ cutting $g i$ in $l$; and fince the triangles $k_{g} l_{,} k, c_{g}$ are fimilar, we have $k l: k_{g}:: k g: k$, and by doubling them all, we have $k i: g b:: g b: 2 k c$. Mr. Picard computes that when the diltance $g_{b}$ is 300 toifes, or 1800 Paris feet, the line $b i$ is one inch: and hence any other $b i$ may be found for any other known diftance; it being as the fquare of the diftance $g b$.

Hence, when the inftrument is thus rectified, the point $b$ upon the level with $g$, may be found by one ubfervation ; that is, by marking the point $i$ covered by the crofs-hairs, and by computing $i b$ by the rule above. As the intervals between the Itations mult be but fmall in this method, becaufe of refractions, as was faid above, the readielt way is to make them all equal ; which may be known exact enough for this purpofe, by obferving whether the pole be removed to fuch a diftance, that its image (or the image of any given part of it) in the focus of the telefcope fhall be always of the fame length, being meafured by the diltance between two parallel hairs in the focus: and then the fame allowance mult always be made for the depth of the point $b$ below $i$.

Lattly, by means of thefe parallel hairs, it is eafy to find when the telefcope is placed in the middle between two fiations; and then the points upon a level at each pole are prefently found, by directing the telefcope firft to one pole and then to the other, and by marking the points covered by the crofs-hairs. And thefe points will be upon a level, notwithftanding any refractions of the vifual rays, becaufe the refraction of each ray will be equal. Smith's Optics, book iii. chap. It.

Dr. Halley fuggefts a new method of levelling, which has been put in practice by fome of the French academy : this is performed wholly by means of the barometer, in which the mercury is found to be fufpended to fo much the lefs beight as the place is farther remote from the
centre of the earth. Hence it follows, that the different heights of the mercury, in two places, give the difference of level.
Mr. Derham, from fome obfervations he made at the top and bottom of the Monument, found that the mercury fell one-tenth of an inch at every 82 feet of perpendicular afcent, when the mercury was at 30 inches. Dr. Halley allows of one-tenth of an inch for every 30 yards; which, confidering how accurately the barometers are now made, an inch, in fome of them, being divided into an hundred, or more parts, all very fealible, he thinks this method fufficiently exact to take the levels for the conveyance of water, and lefs trable to errors than the common levels.
The fame author found a difference of three inches eighttenths, between the height of the mercury at the top and bottom of Snowdon-hill, in Wales.

Mr . Fengufon has calculated the following table, for fhewing how much the mercury would fink in a barometer at given heights above the earth's plane furface; and confequently, how the perpendicular height of any hill may be found thereby.

## LEVELLING.

By this table, and a common barometer tube, the perpendicular height of any hill may be found in the following manner.

The lower end of the tube being immerfed in quickfilver in the common way, and the tube fixed to a board, let a fcale, eighteen inches in length, be divided into inches, and each inch into a hundred equal parts, by diagonal lines, the divilions to be numbered downward from the top. This fcale mult be made to flide in a groove on the board, and have a crofs index to flide upon it to any divifion.

Then, at the bottom or foot of the bill, place the fcale fo as the beginning of the divifions at its top may be jult even with the top or furface of the mercury in the tube. This done, carry the machine up to the top of the hill; then fet the index to the furface of the mercury, and it will fhew how much the mercury has funk in the tube, at the top of the hill, from the point where it food when at the bottom; and the number of feet expreffed in the table, againt the Jike finking of the mercury, will be the perpendicular height of the hill.

Thus, fuppofing the mercury had funk eight inches and three bundredth parts of an inch, the height of the hill muit be 8500 feet, or a mile, and foméwhat more than a quarter. Proportionable allowance is eaflly made for intermediate heights in the table, which are only to whole hundredths of feet.

As Mr. Derham found the difference of height of the mercury at the bottom and top of Snowdon-hill, in Wales, to be three inches eight-tenths (the fame as three inches eighty hundredths) it fhews, that the height of that hill is 3700 feet, or almoft three quarters of a mile.
N. B. 660 feet make an eighth part of a mile, 1320 feet a cuarter of a mile, 2640 feet half a mile, 3963 feet three quarters of a mile, and 5280 feet make a whole mile. See Barometer and Atmosphere.

Fo: the common occafion of levelling to be performed, without much apparatus of inftriments, time, or trouble,
the following method may ferve: fet a pole upright in a fpring, pond, river, or other place, whence water is to be brought, and mark how many feet and inches are above water. Then fet up another pole, of equal length with the other, in the place to which the water is to come. Place the centre of a quadrant on the top of this laft pole, the phummet hanging freely; fpy through the fights the top of the pole that is in the water, and if the thread cuts any degree of the quadrant, the water may be conveyed by a pipe laid in the earth. If you cannot fee from one extreme to the other, the operation may be repeated in the manner already directed.

Levelling Staves, are inftruments ufed in levelling; ferving to carry the marks to be obferved, and at the fame time to meafure the heights of thofe marks from the ground. They ufually confitt each of two long fquare wooden rulers, made to flide over one another, and divided into feet, inches, \&c.

The levelling ftaff is reprefented in Plate VII. Surveying, Fir. 10. It is compofed of two pieces which flide on each other, as $a a$ and $b b$ : they are each of about five feet in length, fo as to form, when fully extended, a rod of ten feet. They have a graduated line of feet into hundredth parts. The index, $c$, flides firmly on them; and is moved up or down (by fignal) by the attendant who carries the ftaff, till the oblerver finds it coincide with the interfecting wires of his telefcope. Its height on the flaff, of courfe, marks the difference of the level; and it has two horizontal and parallel black ftripes, which, at confiderable diftances, are of ufe to direct the eye more readily to the fidacial edge at $x$.

With regard to the manner of directing its application in the bufinefs of draining, it has been obferved, that after it has been properly adjutted, and the ftaft about ten feet in length, with the moveable vane or fight, has been affixed to it, the inftrument fhould be fet up in a fituation between the object from wherce the level is to be taken, "nd that to which it is to be directed, provided the diftance from the inftrument to each of them is not too. great. The fituation of it fhould alfo be no higher than the length of the faff will anfwer, and fo as it may be feen from it both ways; then the man with the itaff fhould be directed to hold it at the main fpring, or place from whence you mean to carry the drain; and after directing the telefcope to the faff, and adjuiting it to a level, make a fign to him to move the fight up or down, till it be exactly oppofite the crofs-hair in the telefcope. This done, without fhifting the inftrument from its firft pofition, asd cautioning the man to fix the fight to the ftaff at the point directed, he may proceed forty or fifty yards farther; and after having again adjufted the level, make a fign to him to move to higher or lower ground; till the fight on the ftaff coincide exactly with the crofs-hair or wire on the telefcope. He may then leave a peg at the place where he held the ftaff, and proceed in like manner to other ftations, till the whole line is finifhed; leaving pegs, or making pits, at the places where the ftaff is held during the operation.

But if the length of the line to be levelled requires the inftrument to be fhifted from its firlt pofition, the level muft again be taken from the latt ftation where the Itaff was held, and the fight on it fixed in the proper place, as before directed; proceeding in the fame manner at every forty or fifty yards in length, till the whole is accomplifhed. After the line is thus levelled, and afcertained by marks left at every ftation where the ftaff was fixed, it may again be examined, and other pegs put in between the firt, the better to direct the workmen in cutting the drain; giving the live

## I. E V

$Q_{u c h}$ turvings, and even fmall deviations from the courfe of the level, as may fhorten or Itraighten it, and humcur the fituation of the ground. And for the fake of accuracy, where the iwork requires it, efpecially if the water is to be conveyed to any conliderable diftance, or wanted to fupply a houfe, or for the purpofe of irrigation, the levels may be proved by reverfing the former line of direction. The fpirit level is alfo neceffary for afcertaining how fuch fall can be obtained from the drain to the nearelt outlet where, the wa.ter can be difcharged; the fhorter that diftance the better, provided fall enough can be gotten. It is often neceflary to level'a mach longer dittance than the length of the drain may require to be cut, in order to come at the true level.

Levelling of Land, in Agriculture, the method of filling up the holes, hollors, or other depreffions and inequalities that are met with in lands, whether they are in the ftate of fward, or in that of tillage. It fhould always be performed in fuch a manner, as the parts thus filled up may at firlt be fomewhat higher than the common furface round them, in order to allow for the fettling, which neceffarily takes place; and fhould be done with fuch materials as can be moft convenientiy procured, and which are proper for the purpofe, being filled in an even and regular manner, and well trodden down at the time. The ridges of fuch lands as have been long under the plongh alfo fometimes require to be levelled down, the proper methods of doing which, under different circumftances, will be taken notice of under that head. Care is, however, conftantly to be taken in the execution of this fort of bufinefs. See Ridge.

Levelling Poles, long wooden rulers, divided inco feet and inches, made to flide over each other, ferving to carry the marks to be obferved in levelling, as well as to meafure the heights from the forface of the ground. They are likewife termed ftaves occafionally. See Levelling Staves, -upra.

LEVEN, in Natural Hifory, a term ufed by Boccone for the milky juice contained in the globules placed at the tops of the italks of red coral. Thefe round buttons are the only part of the coral which are foft while under water, and from thefe the milky juice is eafily expreffed by a gentle fqueezing between the fingers. The globules are each made up of five or fix little cells, not communicating with one another, and each containing its own feparate quantity of this white and thick Huid. When the coral is newly taken up out of the fea, this juice is of a fharp, acrimonious, and altringent tafte; but when it has been fome time expofed. to the air, it lofes the acrimony, and the aftringency of the tafte only remains. This change in the talte is made in fix or eight hours, in hot weather, and the juice, in the fame time, lofes its colour and confiftence, growing hard and brown. Philof. Tranf. N- 100.

LEUENFIORDE, in Geography, a town of Weftphalia, in the principality of Calenberg, on the Wefer; 25 miles W.N.W. of Gottingen.

LEVENHOOKIA, in Botany, named in memory of the celebrated microfcopic philofopher Anthony Van Leeuwenhoek, whofe works, as Mr. Brown obferves, abound with excellent obfervations on the Itructure of vegetables. Eff. Ch, Calyx fuperior, two-lipped, in five deep fegments. Corolla tubular; limb irregular, in five deep fegments; the fifth (or lip) unlike the reft, vaulted, longer than the column, articulated with the tube, and moveable. Column erect, attached below, like the lip, to the fide of the tube. Lobes of the anthers one above the other, divaricated. Stigmas swo, capillary. Capfule of one cell.

## L E V

L. pufilla, the only known fpecies, found on the fouthern coalt of New Holland by Mr. Brown. A little fmooth herb, with nearly the afpect and flature of Radiola. Leaves alternate, ftalked; thofe about the tops of the branches crowded, internixed with cluttered forvers. The moveable joint of the lip is analogous to the irritability in the column of Stylidium, and anfwers the fame end, which is the prefervation of the organs of impregnation; for this lip, which is deflexed in the expanded flower, when affected by any irritating caufe, is turned upwards with violence, fo as to cover the upright and immoveable column with its concave part. Brown.
Levens, Leva, or Levencz, a town of Hungary, near the river Gran, where the Turks were defeated, after a defperate engagement, in the year 1664, with the lofs of 12,000 men killed, and 1500 taken prifoners, with their artillery, \&c.; 24 miles N.N.E. of Gran.

LEVENTAN, a lake of Pruffia; 56 miles S.E. of Konigfberg.

## LEVENTI. See Lafend.

LEVER, Sir Asutov, in Biography, was the fon of fir D'Arcy Lever of Alkington, near Manchefter. He finifhed his education at Corpus Chrifti college, Oxford; and on leaving the univerfity he went to refide with his mother, and afterwards fettled at his family-feat, which he rendered famous by the beft aviary in the kingdom. He next extended his views to all branches of natural hiftory, and became at length poffeffed of one of the fineft mufxums in the world, fparing no expence in procuring fpecimens from the moft diflant regions. This mufrum was difpofed of by lottery in 1785, but to the great lofs of the proprietor. It was, for fome years after this, exhibited to the public at a fmail charge, but is now difperfed, the articles having been fold feparately by auction. Sir Afloton died in 1783. Europ. Mag.

Lever, or Leaver, in Mechanics, an infexible. ftraight bar, fupported, in a fingle point, on a fulcrum, or prop, and ufed for the raifing of weights.

The word is formed of the French levier, which fignifies the fame; formed of the verb lever, or Latin lczare, io raifc.

The lever is the firft of thofe called mechanical powers, or fimple machines, as being, of all fuch, the moit fimple; and is chiefly applied for raifing weights to fmall heights.

In a lever there are three things confidered: the weight to be raifed, or fuftained, as O, Plate XXX. ATecbanics, fig. 4. ; the power byi which it is to be raifed, or fultained, as $B$; and the fulcrum or prop, $D$, on which the lever is fultained, or rather on which it moses round, the fulcrum remaining fixed.

Levers are of three kinds: fometimes the fulcrum, or centre of motion, is placed between the weight and the power, as in fig. 4. This we call a lever of the firf kind, or vectis beterodromps; to which may be reduced fcufars, pincers, fnuffers, \&c. Sometimes the weight is between the fulcrum and the power, which is called a lever of the fecond kind, as in fig. 5. Of this kind are the oars and rudder of a boat, the mafts of fhips, cutting knives fixed at one end, and doors whofe hinges are as the fixed point. And fometimes the power acts between the weight and the fulcrum, which is the lever of the tbird kind. Such is a ladder ifted by the middle to rear it up againt a wall : thefe two are called vedes homodromi.

In this laft, the power mult exceed the weight in proportion as its diftance from the centre of motion is lefs than the diftance of the centre from the weight. And as the firft two kinds of leyer ferve for producing a flow motion by afwift one, fo the laft ferves for producing a fwift motion of

## 1. E V

the weight by a flow motion of the power. It is by this kind of levers that the mufcular motions of animals are perforned, the mufeces being inferted much nearer to the centre of motion than the point where the centre of gravity of the weight to be raifed is applied; fo that the power of the mufcle is many times greater than the weight which it is able to fultain. Though this may appear at firft a difadvantage to animals, becaufe it makes their ftrength lefs: it is, however, the effect of excellerit contrivance; for if the power was, in this cafe, applied at a greater diftance than the weight, the ligure of animals would be not only awkward and ugly, but altogether unfit for motion; as Borelli has fhewn in his treatife "De Motu Animalium." The power of the lever is founded on the following theorem; viz. "That the fyace, or arc, defcribed by each point of a lever, and confequently the velocity of each point of a lever, is as its diltance from the fulcrum, or prop."

From hence it follows, that the action of a power, and the refiftance of the weight, increafe in proportion to their diftance from the fulcrum.

And hence alfo it follows, that a power will be able to fultain a weight, if the diftance of the point in the lever, to which it is applied, be to the diftance of the weight, as the weight to the intenfity of the power; which, if it be ever fo little increafed, mult raife the weight. Sce this doctrine demonftrated under the word Meciavic Powers; and farther illuftrated under the word Balance; between which and the lever there is a great analogy; a lever of the firtt kind being a fort of theelyard to raife weights.

The power and action of the lever will be fully illuftrated by the following propofitions:

1. If the power applied to a lever of any kind futtain a areight, the power is to the weight in a reciprocal ratio of their diftances from the fulcrum.
2. The weight of a lever of the firft or fecond kind, A B, fig. 4, the diftance of the centre of gravity from the fulcrum C V, and the diftances of the weight, and the power A C and C B, being all given, to find the power that will fuftain it. Suppofe the lever void of gravity, but in lieu thereof a weight hung at $V$ : if then $A C$ be made to $C V$, as the gravity of the lever to a fourth number, we fhall have the weight which the lever is ahle to futtain; and this fubtracted from the given weight, the remainder will be the weight to be futtained by the power. Let CB then be to C A, as the remaining weight to a fourth weight, and we fhall have the power to be applied in B , in order to fultain the given weight with the given lever.
3. The gravity of a lever of the firft or fecond kind, A B, the diftance of the centre of gravity from the fulcrum CV , the diftances of the power, and the weight BC and CA , being all given, to find the weight to be fullained. Find the part of the weight fuftained by the lever alone, as in the former problem: in the fame manner find the other part of the weight, which the power applied in B is able to fultain; add the two numbers together, and the fum is the weight required.
4. The gravity, and centre of gravity F , of a lever of the fecond kind C B, fig. 5 , with the weight G, its diftance from the fulcrum $\mathbf{C A}$, and from the power CB, being given, to find the power capable of fuftaining the weight. Suppofe the kever void of gravity, but in lieu thereof a weight equal thereto hung in $F$, the power required to ful. tain the lever alone; then find the power requiifte to fuftain the given weight $G$; add the powers together, and the fum will be the power required.
5. If a power applied to a lever of any kind lift a weigkt, the fpace of the firlt is to that of the laft, as is this laft to a

## LE V

power able to funain the fame weight; whence it follors; that the gain of force is always attended with the lofs of time, and vice verfa.
When the two arms of a lever are not in a right line, but contain any invariable angle at C , fig. 6 , the lever is called a bended lever; and is evidently of the firt kind, and the law of the equilibrium is the fame; $i_{0} c_{0}$ of the power $P$ be applied at B to the arm C B, and the weight W acts by means of a pulley M , in the direction $\mathrm{A} M$, perpendicular to the arm A, the power and weight will fultain each other, if $P$ be to W , as CA to CB , or $\mathrm{P} \times \mathrm{CB}=\mathrm{W} \times \mathrm{CA}$. If feveral powers act upon the arm CA , find their centre of gravity, A, on the arm C A, and fuppofe all the powers to be united there; and if the power P be to their fum as $\mathrm{C} A$ to C B, it will futtain them. The fum of the powers being given, it is manifelt that the farther their centre of gravity $A$ is removed from the centre of motion C , the greater refiftance they will oppofe againtt the power $P$, and it will require the greater force in the power to overcome them. Hence Galileo juftly concludes, that the bones of animals are the tironger for their being hollow, their weight being given; or if the arm CBF reprefents their length, the circle CHD a fection perpendicular to the length P , any power applied along their length, tending to break them; then the ilrength or force of all their longitudinal fibres, by which the adhefion of the parts is preferved, may be conceived to be united in A , the centre of the circle C H D, which is the common centre of gravity of thofe forces, whether the fection be a circle or annulus. But it is plain that when the area of the fection, or the number of fuch fibres is given, the diflance CA is greater when the fection is an annulus than when it is a circle without any cavity: confequently the power with which the parts adhere, and which refifts againlt $P$, that endeavours to feparate them, is greater in the fame proportion. For the fame reafon, the italks of corn, the feathers of fowls, and hollow fpears, are lefs liable to accidents that tend to break them, than if they were of the fame weight and length, but folid, without any cavity. In this inflance, fays Mr. Maclaurin, (View of Sir. 1. Newton's Phil. Difc. book ii. chap. 3. (13.) art only imitates the wifdom of nature. See Mechanical Pozers.

Lever, or Veclis, in Midiwifery, an inftrument ufed to facilitate the birth of the head of the child, when it remains long fixed in the brim of the pelvis of the mother. It is ufually called the lever of Roonhuyfen, the name of a furgeon of Amiterdam, who has the credir of having invented, or firlt made ufe of it. Roonhuyfen is faid to have been inftructed by Dr. Hugh Chamberlen in the method of ufing the forceps, (fee that article,) for which he paid him a confiderable fum of money: but finding, in many cafes, great difficulty in introducing the fecond blade of the forceps, he confined himfelf to the ufe of a fingle blade; and procuring an inftrument to be made upon that principle, he called it his lever. Ruyfch was alfo faid to participate with him in the ufe of this new contrivance. It was for a long time applied with great caution, and only fhewn to fuch of their pupils as paid them a fpecific fum for the purpofe. At length De Vifcher and Van de Poll, two phyficians of Amitterdam, purchaied the fecret of a defcendant of Roonhuyfen, and publifhed a defcription of the inltrument, and of the manner of ufing it, in the Dutch language. This account was, many years after, tranflated into - French by M. Preville, and affixed to his tranllation of Smellie's Treatife of Midwifery, to which he added an engraving of the inftrument.

The lever is a flat piece of iron, twelve inches in length,

## I. E V

one inch in breadth, and a quarter of an inch in thicknefs. It is itraight in the middle for four inches, and moderately curved at cach end. (See, Plate Surrery.) In ufing it, one or two tingers of the right hand (the woman lying on her left fide, as in a natural labour) muft be introduced under the pubes, and fo far, if practicable, as to reach an ear of the child, when the lever is to be flowly and gradually infinuated between the fingers and the head of the child. The fingers are now to be withdrawn, and the bandle of the lever to be raifed towards the belly of the woman, and gently moved about, until the head of the child is lodged in its curve. The more completely the curve touches and embraces the head of the child, the more fpeedily and eafily the delivery will be effected. During every pain, the handle of the lever mult be raifed with the right hand, and its middle preffed Jown with the left hand. This will prevent the foft parts of the woman covering the os pubis from being injured. When by this means the head of the child has been made to defcend into the vagina, the left hand muft be removed from the middle of the inftrument, and applied over the anus and the perinzum, to guard thofe parts, (which will be found to be much diftended,) and to prevent their being lacerated; for which purpofe, alfo, the whole of the operation (which will ufually be completed within between ten and twenty minutes) muft be performed flowly and cautioufly, imitating as much as poffible a natural labour.

For further information on this fubject, fee Dr. Bland's Account of the Invention and Ufe of the Lever, publifhed in the fecond rolume of Medical Communications, $1 / 90$.

Leverano, in Geography, a town of Naples, in the province of Otranto; 7 miles N. of Nardo.

LEVERET, amonglt Sport/men, a young hare, in the firf year of its age.

LEVERETT, in Gcography, a townihip of America, in Hampflaire county, Maffachufetts, near Connecticut river; 94 miles $W$. from Botton; incorporated in 1774 , and containing 711 inhabitants. A copper-mine has been lately difcovered in this townhhip.

LEVERIDGE, Riciard, in Biography, was a finger of Purcell's fongs, in the time of Charles MI. and in that of William and Mary. During the reign of queen Anne, he performed in 1 jo6 the part of lir Trulty, in Addifon's Rofamond; and in the firft attempts at opera on the Italian model, he fung his part in Englifl, in Canilla and Thomyris; while Nicolini, Valentini, and the Margarita, verformed their parts in Italian.
He had a deep and powerful bafe woice; was a ufeful performer on the Englifh ftage on many occafions, particularly at Covent Garden, where he attached himfelf to Rich, and his pantomime.entertainments, to the end of his life. He was nor, however, without genius for poetry and compofition, as far as a ballad went. We remember his finging one written and fet by himfelf," Gholts of every Occupation,", and feveral of Purcell's bafe fongs occafionally, which, fifty years ago, feemed antediluvian ; but as he gencrally was the reprefentative of Pbuto. Neptune, or fome ancient divinity, it correfponded perfectly with his figure and character. As he was not only a celebrated: finger of convivial fongs, but the writer of many that werein great favour with lingers and hearers of a certain clafs, who more pioully performed the rites of Comus and Bacchus than thofe of Minerva and Apollo, he had always a crowded houfe at his benefit; nor did he leave this fublunary world, or the fage, till 1758 , at 88 jears of age.

LEVET, in Geagraphy, a town of France, in the de-
partment of the Cher, and chief place of a canton, in the diltrict of Bourges; 6 miles S. of Bourges. The place contains 645 , and the canton $52 \sigma_{3}$ inhabitants, on a territory of $232 \frac{1}{2}$ kiliometres, in 16 conmmunes.

LEVI, Bex-Geranoma, in Biograply, a learned rabbi, who flourifhed in the fourteenth century, was born in Pro. vence about the year 1290. His ctebrity is founded chiefly on his philofophical and theological writings. He was a difciple of Arillote, and philofophizes in the fpirit of his mafter, when diffuling fubjects of facred literature. He died in 1370, when he was So years of age. He was, author of "Commentaries" on all the books of the Old Teltament, of which fome are inferted in the great bibles of: Venice and Bafil; and others were feparately printed at Pefaro, Venice, and Paris. He was author of a philofophical work, entitled "Millemot Hafchem," or "The Battles of the Lord," divided into treatifes on the immortality of the foul, the knowledge of future cyents, prophecy, the interpretation of creams, the omnifcience of God, \&ec.; and of various other treatifes, which wereformerly preferved in MS. in the Vatican library, and in that belonging to the congregation of the fathers of the oratory at Paris.

Levi, Ifle dus Fort, in Geography, an ifland in the riverSt. Lawrence, Upper Canada, in front of the townhip of: Edwardfburg. On this ifland are the ruins of a French fortification.

LEVIEION, a town of Perifa, in the province of Irak ; $3^{6}$ miles W.S.W. of Ifpahan.

LEVIER, a town of France, in the department of the Doubs, and chief place of a canton, in the dittrict of Pontarlier; 10 miles W. of Pontarlier. The place contains 106 9 ; and the canton 7727 inhabitants, on a territory of 310 kiliometres, in $1 ;$ communes.

LEVIGATION, the reduction of hard and ponderous bodies, as coral, tutty, precious ftones, \&c. into a fine fubtil powder, by grinding them with water upon porphyry, or the like, as painters do their colours.

Levigation is much ufed in pharmacy and chemiftry; but unlefs the grinding inftruments be extremely hard, they will wear away, fo as fometimes to double the weight of the medicine thus managed.

LEVIKATE, in the Jewijb Culfoms, a term ufed by authors who have written on the law and cufloms of the Jews, to denote particularly that law of Mofes, which obliges one brother to marry the widow of another, who died without children, to raile up feed to him.

The word is derived from levir, which fignifies, in Latin, the hufband's brother, or the brother-in-law' and the word levirate has been hence formed, to exprefs the law whereof we have been fpeaking.

This law, which is an exception to that which condemns. marriages between brothers and fifters, and between bro--thers-in-law and fifters-in-law, feems to have been in ufe among the Hebrews and Canaanites before the time of Mofes ; fince Judah gave his firlt-born Er, and Onan his. fecond fon, fucceflively to Tamar, and obliges himfelf to give her likewife to Selah his third fon. Calm. Dict. Bibl.
LEVISANUS, in Botany, a name given by Petiver, who wrote it Lezuifunus, in honour of the Rev. Dr. Lewis, who fent him feveral plants as: well as fhells from Madras. The Cape flarub to which this appellation was given, having been referred by Limmeus at one time to Brwnia, at another to Protea, is now Leucadendron Levifanus, Brown Tr. of Linn. Suc. v. 10. 55. (See Leucablidilos.) Schreber in his Gen. Pl. 149, eftablifhed another Lovijanus out of

Brenia;

Brunic；but this is now Staivia of Willdenow，Sp．Pl． V．8． 1144 ，a name which we prefume will remain．

LEVIT＇A，in Geography，an ifland in the Grecian Archi－ pelago，about cight miles in circumference．N．lat． $37^{\circ}$ ． E．long． $26^{\circ} \mathbf{1 4}^{\prime}$ ．

LEVYTE，an inferior kind of minifter in the Jewifh ta－ bernacle and temple，who had the care and management of the facred utenifis．

The word comes from the Greek heurnt，the root of which is the name Levi；which was given to that patriarch by his mother Leah，from the Hebrew Mi＇，lavah，to be tied，or united；Leah hoping，by the birth of this fon，to be more clofely linked to her hufband Jacob；and，therefore， in a large fenfe，the Levites were the pofterity of this pa－ triarch，and conitituted one of the twelve tribes of Ifrael． In a more reftrained and peculiar fenfe，they were a lower order of ecclefiaftical perfons，inferior to the priefts，and their affiftants in the facred fervice．The fons of Levi were appointed to this office，in confequence of the extraordinary zeal they difcovered againft idolatry，in the cafe of the golden calf．Exod．xxxii．26． 28.

When God miraculoufly deftroyed all the firft born of the Egyptians（Exod．xii．29．），he fpared the firt born of the $I$ Iraelites；and in order to preferve the remembrance of the miracle，and of that great deliverance from their bondage in Egypt，which that miracle occafioned，he was pleafed to appoint that for the future all the firft－born males＂fhould be fet apart unto himfelf．＂（Exod．xiii．12．16．Numb． viii．17．）But afterwards，on the occafion above men－ tioned，the whole tribe of Levi had the honour affigned them，inftead of the firt－born of IIrael．＂And that it might appear there was a juft fubfitution of the Levites for the firit－born，number for number，he ordered an eftimate to be made of both；and when，on cafting up the poll，the firlt－ born were found to exceed the Levites by 273 ，the furplus was redeemed at the price of five fhekels a head，which was paid to the priefts for the ufe of the fanctuary．（Numb．iii． 14 ，ad fin．）We may here obferve，as a circumitance worthy of notice，that the pofterity of Mofes were no more ithan common Levites，while the defcendants of his brother Aaron were advanced，by the appointment of his law，to the dignity of the priefthood．（ ${ }^{1}$ Chron．exiii．13，14．） This is a plain evidence that Mofes was not influenced by any worldly or ambitious views，or rather that he was not the contriver and author of the law which he gave to Ifrael， but received it from God：for if he had framed it，it is na－ taral to fuppofe that he would have made fome better pro－ vifion than he did for his fons，and for the grandeur of his houfe，and not have advanced his brother＇s above his own．

The Levites were originally divided into three claffes，or families，frons the three fons of Levi，Kohath，Gerfon， and Merari；but afterwards by David into twenty－four courfes．I Chron．xsiii．6．ch．xxviii．11－13．

The Levites，in the Jewih church，were an order in－ ferior to the priefts；and anfwered，iu fome meafure，to deacons，in the Chriftian church．On their firft inftitution， a great part of the fervice that was affigned them was pe－ culiar to the ftate of the Ifaelites at that time；and it was fervile and laborious．But when they were fettled in the land of Canaan；and the tabernacle was no longer carried about as before，the fervice of the Levites was，of courfe， changed，and became much more eafy．On which account， ir the time of David，they were thought fit to enter on their office at the age of 20 years；whereas，by the original ap－ pointment of Mofes，they were not admitted till they were ${ }_{2 j}$ or 30 jears of age，and were difcharged at 50．（Numb．
iv．3．13．43 ch．viii．24，25．）It is an opinion among the Jews，that the Levites paffed through four different degrees． From one month old to their twentieth year they were in w ftructed in the law of God；from twenty to twenty－five，；in？ the functions of their miniftry ；from that period to thirty， they ferved a kind of apprenticefhip，beginning to exercife themfelves in fome of the lower branches of the facred fer－－ vice；and laftly，when they attained their thirtieth year， they were fully inftituted in their office．A fimilar grada－ tion，probably borrowed from that of the Jewifh Levites， has been obferved among the veftal virgins；and fome have fuppofed that this gradation is referred to by the apofle， when he tells Timothy，that they who perform the office of a deacon well purchafe to themfelves a good degree；ха⿱口⿰口口ov $\beta \times 9_{\mu x \%}$ I Tim．iii． 13.

We have already obferved，that the Levites were oric ginally ditributed into three families；and in David＇s＇time， they were diftinguifhed into three claffes，to each of which a different fervice was affigned；and probably each was di－ vided into twenty－four courfes．The firft clafs was ap－ pointed to affif the priefts in the exercife of their minittry ； the fecond clafs formed the temple choir ；the third clafs had the charge of the feveral gates of the courts of the fanctuary affigned them by lot．（I Chron．xxvi．1．15．19．＇ 2 Chion．） xxxy．15．viii．14．）The Levites exercifed the office of magiftrates，which office belonged to them，not as Levites， but as perfons who generally addited themfelves more to the Itudy of the law，and had more leifure to attend on the． duties of the magifracy，than others who were employed in fecular bufinefs．The magiftrates of different ranks，both the＂fhophetim＂and＂hoterin？，＂were very generally， though not always，chofen out of the tribe of Levi．Thus， the prophetic curfe，denounced by Jacob againt Levi， （Gen．xlix．7．）was remarkably accomplifhed，（though in effect converted into a bleffing，）not only in refpect to the appointment of their habitation，but likewife of their offices and employments；more of them，than perhaps of all the tribes taken collectively，being officers and judges through－ out the whole country；and probably，as the rabbies tell us，fome of theni were generally directors of their feminaries of learning．Of the confecration of the Levites，and of the ceremonies attending it，we have an account in Numb．viii． 10， 11.

As to the refidence and fubfiftence of the Levites，we may obferve that they had no fettled lands allotted them for their maintenance，as the other tribes had，but lived chiefly on the offerings made to God．（Deut．xxiii．1，2．）．They were diftributed through all the tribes，each of which gave fome of their cities to the Levites，amounting in all to the number of thirty－five，with grounds in their neighbourhood for the fubfiftence of their flocks．（Numb．xxxv．4，5．） In the weeks of their attendance at the fanctuary，they were maintained by the dues arifing from the facrifices；befides thefe dues，the firft fruits，which were brought to the temple，and the money paid for the redemption of the firt－ born，contributed to their fubfiftence．But，when they were out of waiting，their maintenance partly arofe from the glebes belonging to their cities，and chiefly from the tithes of the produce of the whole country，which the law allotted to the tribe of Levi，（Numb；xyiii．25．）a teath of which they paid to the priefts．See Tirue．

According to the numeration made by Solomon，from the age of twenty there were thirty－eight thoufand Levites capable of ferving：twenty－four thouland of thefc he ap－ pointed for the daily miniftry under the priefts；fix thoufand to be inferior judges in the cities，and to decide matters re－
lating

## I. F. V

lating to religion, and of no great confequence to the flate; four thoufand to be door-keepers, and to take care of the riches of the temple; and the relt to do the oflice of chaators, or fingers.

LEVITICAL Degrees, in Laev. Sec Marmage:
LEVITICI, in Church Hifory, a fect of heretics, who fpring from the Gnoftics and Nicolaitans.

LEVI'I'ICUS, a canonical book of the Old Teftament, fo cailed from its containing the laws and regulations relating to the priefts, Levites, and facrifice: Sec Caxion and Pentateuch.

LEVIT'Y, the priwation or want of weight in any body, when compared with another that is heavier.

In whica fenfe, levity ftunds oppofed to gravity.
The fchools maintain, that there is fuch a thing as pofitive and abfolute levity, and impute ro this the rife or emergency of bodies lighter in fpecie than the bodies wherein they rife.

But we find by experience, that all bodies tend towards the earth, fome flower, and fome fatter, in all fluids, or mediums, whether water, air, \&c. Thus, cork is only faid to be lighter than gold, becaufe, under equal dimenfions, the gold will fink in, and the cork fwim upon water.

Archimedes has demonftrated, that a folid body will float any where in a fluid of the fame fpecific gravity; and that a lighter body will keep above a heavier. The reafon is, that of bodies falling towards the earth, thofe which have a like number of equal parts, have equal gravity $;$ fince the gravity of the whole is the fum of the gravity of all its parts. Now two bodies have an equal number of equal parts, if under the fame dimenfions there be no intervals deftitute of matter; whence it follows, that as no portion of matter is fo fmall, but that the body wherein it is contained may be wholly divided into parts equally fmall, there can be no reafon for the defeent of thefe, which will not equally hold for the defcent of that.

Hence it may be concluded, that thofe bodies which do not equally gravitate under the fame dimenfions, do not contain equal portions of matter; and, therefore, when we fee, that a cube of gold fublides in water, at the fame time that an equal bulk of cork fwims upon it, it is evident, that the goid mutt have a greater number of equal parts of matter, under the fame bulk, than the cork; or the cork muft have a greater number of vacuities than the gold; and that there is alfo in the water a greater number of vacuities than in gold: See Fluids, and Specific Grivity.

Hence we lave a clear idea both of denfity or gravity, and of levity; and know, that the latter cannot, in a dtrict fenfe, be accounted any thing pofitive, but only a mere negation or abfence of body; which desermines that body to be lighter than another which contains more matter.

Dr. Hook, it is true, feems to maintain fomething like a pofitive levity; which, if we miltake not, is what he means by the term levitation; riz. a property of bodies directly contrary to that of gravitation towards the fun.

This, he thinks, he has difcosered in the tlreams of fe. veral comets; which, though they had a defcent from the nucleus of the comet towards the fun, yet they quickly returned, and went uppofite to the fun, and that to a prodigious extent. In effect, where the power of gravitation ccales, it fhould feem fome fuch contrary force docs begin ; whereof we have inftances in the phenomena of attraction. I'his is what fir lfaac Newton calls the wis repellens, and appears to be one of the laws of nature; without which it would be hard to account for rarefactions and fome ather appearances.

Vol. XX.

## I. E V

LEVIZANO, in Genyraply, a town of Italy, in the department of the Panaro; lix miles S.s. E. of Mudena.

LEUK, a fmall town of Switzerland, built upon aa cminence about a mile from the Whine, and the principal place of one of the dixains of the Vallais; containing two churches and a large palace of the bifhops of Sion. At the diftance of fix miles $N$. are celcbrated baths, faid to b beneficial in rheumatifms, difeafes of the fkin, Scc. and to refemble thofe of Bath. Here are feveral fprings of different warmth and of different qualities, According to accurate experiments, the mercury in Fabrenbeit's thermometer, when planged into the principal fource, food at 115 , and at $\$ 20$ in the fpring which flows near the bridge over the Dola. Leuk is diftant 20 miles E. from Sos .

LEVFOPOL, a town of Rutlia, in the province of Tanris ; 80 miles S. of I'erekop. N. lat. $45^{\circ} \mathrm{G}^{\prime}$. L. loné. $3 t^{\prime \prime} 24^{\prime}$.

LEUNCI, AVIUS, Jonn, in Fiografby, an eminent man of letters in the feventeenth century, fon of a gentlman of Wreltphalia, was brought up to the profeffion of the law, with which fcience he was intimately acquainted, as well as with literature in general. He was a great traveller. and refided a confiderable time in 'l'urkey. Ife died at Vienna in 1693 , about the 6oth year of his age. From his knowledge of the Turkinh language he was erabled to collect fome raluable materials for the hiftory of that nation, which he publifhed under the title of "Hiltoriz Mullimanicæ T'urcarum," and his "Annales Tuzcici cum Supplemento et Pandectis Hilt. Turcicæ." His intimate knowledge of the Greek language was difplayed in feveral Latin tranflations of Greek authors, viz. Xenophon, Zozimus, the annals of Conltantine Manaffes, and of Michael Glycas; the Greek abridgment of the fixty books of Roman law; various works of St. Gregory of Nazianzen, \&c. Bayle.

LEVONOVK, is Geography, a town of Ruffia, in the government of Irkutfl, on the Lena; 52 miles S S.W. of Kirenf:
L.EUPOLD, JAmes, in Biograpby, a very celebrated nechanician, and noted for his conftruction of mathematical inftruments, and other machines for the elucidation of facts in philofophy, was commiffary of mines to the king of Poland, and a member of the Royal Society of Berlin, and other fcientific bodies. He died at Leeipfic in 1727 , after having acquired celebrity by the publication of a work, which is ftill highly efteemed, entitled "Theatrum Machinarum," in three vols. folio.

LEVRET, Anprriw, an eminent French furgeon and accoucheur, was admitted a member of the Royal Acadeny of Surgery at Patis"in February, 7742 . He obtained a high and extenfive reputation in his department of the art, by the improvements which he made in fome of the initruments recellary to be employed in certain dificult cafes, (efpecially the forceps,) and by the prodigious number of pupils whom he inftructed. He was employed and honoured with official appointments by all the female branches of the royal family. He publithed feveral works, which underwent various editions and tranflations. "Ubfervations fur les caufes et les accidens de plufieurs' accouchemens laborieux," Paris, 1747. To the fourth edition, in 1 r70, were added, "Obfervations, on the lever of Rocnhuyfen." "Onfervations fur la cure radicale de plufieurs polypes de la matrice, de la gorge, "et du nez, operée par de nouveaux moyens," ibid. $17+9$, Sce. "Suite des obfervations fur les caufes et les accidens de plufietrs accouchemens laboricux," jbid. 17jx. "Explication de plufieurs figures fur le mécha. nimme, de la groffeffe et de l'accouchement," ibid. 1752. "L'Art des accouchemens démontré par des principes de

## LE U

phyfique et de mechanique," ibid. 1753 , \&c. "Efai fur l'abus des regles generales, et contre les préjugés qui s'oppofent aux progres de l'art des accouchemens," ibid. $1 \% 66$. Eloy Dict. Hit.

LEV ROUX, in Geography, a town of France, in the department of the Indre, and chief place of a canton, in the diltrict of Chateauroux; 10 miles N. of Chatearroux. The place contains 2800 , and the canton 8904 inhabitants, on a territory of $352 \frac{1}{2}$ kiliometres, in 15 communes. N. lat. $46^{\circ}$ 59. E. lang. $1^{\circ} \mathbf{1 r}^{\prime}$.

LEUSDEN, Jons, in Biography, an eminent philologit, was born at Utrecht in $6^{2} 4^{\circ}$ He laid the foundation of a learned education in his native city, and then went to Amiterdam to improve himfelf in the Hebrew language, and in the knowledge of the Jewif ritual from converiation with the learned rabbis. He obtained, in the year 16.49 , the profeflorlhip of Hebrew and Jewilh antiquities at Utrecht, which he held, with great reputation, till his death in 1699 He was a capital critic, and was highly celebrated as a teacher. He gave correct editions of the works of Bochart and Lighfoot, and of Poole's Synopfis. His own writings are numerous and very valuable, of which the principal are "Clavis Hebraica et Philologica Vet. Telt." $4^{\text {to. "Clavis }}$ Greca Novi Teft. cum Amnot." "Compendium Græcum Novi Teft." "Philological Notes upon Jonas, Joel, and Hofea," two vols. 8vo. Moreri.

LEUTENBERG, in Geography, a town of Germany, in the county of Schwartaburg-Rudolitadt, on the Sorbitz; near which are mines'of filver and copper ; eight miles S.E.. of Saalfeld. N. lat. $50^{\circ} 28^{\prime}$. E. long. in $35^{\prime}$.

LEUTHEN, a town of Silefia, in the principality of Breflau ; ro miles W. of Breflau.

LEUTKIRCH, a town of Bavaria, near the Efchach, on a heath to which it gives name. This town was free and 'imperial till the year ISO2, when it was conveyed, among other indemnities, to the elector of Bavaria. It has a Lutheran and a Roman Catholic church, together with a nunnery of Francifcans. The magiftrates are mofly Lutheran; 28 miles S. of U/m. N. lat. $47^{\circ} 53^{\prime \prime}$. E. long. $10^{\circ}$.

LEUTMischl, or Litonysl, a town of Bohemia, in the circle of Chrudim; 22 miles E. of Chrudim. N. lat. $49^{\circ} 47^{\prime}$. E. long. $165^{\prime}$.

LEUTO, Ital. in Mufic. See Lute, and Tineorbo.
LEUTSCH, in Geography, a town of the duchy of Carniola ; eight miles S.S.E. of Hydria.-Alfo, a town of Hungary, which has frequently fuffered from fire; 14 miles W. of Szeben.

LEUTZBURG, a town of Switzerland, in the canton of Berne; fix miles S. of Brugg.

LEVY, Levare, in Law, lignifies to gather or collect ; as, to levy money, to levy troops, \&c.

Levy fometimes alfo denotes to crect, or fet up; as, to levy a raill. Levy a'fo fignifies to raife or cait up ; as, to levy a ditch. To levy a hire of lands, is to pais a fine.

LEVYING ATon:'y wuithout Confent of Parliament. No fubject of Ergland can be conltrained to pay any aids or taxes, even for the defence of the reaim or the fupport of government, but fuch as are impofed by his own confent, or that of his reprefentatises in pariament. LEUZE, in Geography, a town of France, in the department of the Jemappe, and chief place of a canton, in the diftrict of Tournay, feated on a brook near the Dender ; sight miles E, of T'ournay. The place contains 3528 , and

## L. E W

the canton 14,448 inhabitants, on a territory of $122 \frac{1}{2}$ kilio. metres, in 15 communes.

LEWALDE, a town of Pruffia, in the province of Oberland ; 12 miles N.N.IV. of Soldau.

LEWA RDEN, a city of Hoiland, and capital of Friefland, fituated in a quarter called "Ooltergoo." From being a fmall town in 1190 , when it was furrounded with a wall, it has become large, rich, and populous, fortified with ramparts, and defended by a large ditch, battions, and other works: the flreets are regular and fpacious, and feparated by eanals which interfect each other, facilitate communication with the fea and with the internal parts of the province, and contribute to an extenfive trade with Holland, Bremen, Hamburgh, and other places. The town houfe, crected in 1715 , is a handfome building. The magiftracy confilts of three burgo-mafters and nime echevins; 28 miles W. of Groningen. N. lat. $53^{\circ} 12^{\prime}$. E. long. $5^{\prime \prime} 43^{\prime}$.
I.EWCKOCE, a town of Poland, in Podulia; 44 miles N.N.E. of Kaminiec.

LEWDNESS is punifhable by our law by fine, imprifonment, and fuch corporal infamons punifhment, as the court may think meet, according to the heinoufnefs of the crime. (I Hawk. 7.) And Mich. ${ }_{5}$ Car. II. a perfon was indicted for open lewdnefs, in fhewing his naked body in a balcony, and other middemeanors, and was fined two thoufand marks, imprifoned for a week, and bound to his grood behaviour for three years. (I Sid. 168.) In times palt, when any man granted a leafe of his houfe, it was ufual to infert an exprefs covenant, that the tenant fhould not entertain any lewd women, \&ic. See Adultery, Bastaidd, Bawdy-house, Incest, \&c.

LEweHAGEN, in Geograpby, a town of Pruffia, in the circle of Natangen ; eight miles E.S.E. of Konigßerg.
LEEVEN, a town of Bohemia in the circle of Leitmeritz; eight miles N.E. of Leitmeritz.

LEWES, a confiderable borough and market town in the hundred of Barcombe, rape of Lewes, and county of Suffex, England, is fituated on the eaftern extremity of one of thofe bold and fertile eminences zalled the South downs, and fo juftly ceeebrated in the topography of that county. Lewes, being anciently a demefne of the crown, appears to have appertained to the South-Saxon kings, then to the Weft-Saxon, and afterwards to the Saxon and Davifh monarchs of all England; and, though each of thofe revolutions by which it changed its royal lord, removed the court till farther from this town, its natural advantages fecured it a refpectability not inferior to that of the firlt boroughs in the kingdom. During the Danifh ravastes from the clofe of the eighth century to the beginning of the eleventh, Lewes was rendered, both by art and wature, the molt eligible place of refuge for the inhabitants of the adjacent country, and a firm barrier, againat the invaders. In the reign of Athelltan, Lewes was a very confiderable place; for it was then the chief town and mart of more than half the thire. And in that king's ordinance for prohibiting the coinage of money, except in towns of efpecial note, Lewes was allowed two mints, and Chichelter but one; a proof of the early refpectability of the former. On the death of Edward the Confefor, this town, with the other appanages of the crown, devolved to Harold, and on his cefeat was given by the Conqueror to his for-in-law William, lord of Warren, who made it his chicf refidence, and built here a grand manfion and fortifications ; the gate and two towers of his cafte tull remain. In the time of Edward the Confefior here were 127 burgeffeg. Lewes con. inued in the poffeffion of the lords Warren for nearly three centuries, when the male line being extinct, it defcended to Richard Fitz-Allen, earl of Aruncel, fon of Alice, filter of the late earl of War-

## L E W

## I. E W

ren. In his heirs the barony of Lewes has continued to the prefent time. A memorable battle was fought in the vicinity of this town in the year 126., between Henry III. and the confederate barons under Simon de Montfort. A particular account of this is printed in Lees Hillory, \&c. of Lewes, Svo. $179 \%$.
Lewes is a well built town, and one of the largeft and mort populous in the county. It had formerly twelve parilh churches, which are now reduced to fix, including St. Thumas at Cliffe, fo called from its ftanding under the high chalky cliffs at the out-fikits of the town. The other cluurches are All-Saints, St. John's under the Callle, St. Michael's, St. Peter's and St. Mary's Wettout, now called St. Anne's, and St. John's, Southover. The diffenters, who have been refpectable and numerous in this town, have alfo their places of worthip.
Lewes is a borough by prefcription, but not incorporated; the civil government is velted in tivo conftables, who are annually chofen by the burgefles. Two members have been returned to parliament ever fince the 26 th year of Edw. I. The right of election is in the inhabitants paying fcot and lot, in number abont 310 . In the year $150+$ an act of parliament was obtained for holding the fhire or county-court alternately at Lewes and Chichelter. From the town-book, fince that time, a few items may be extracted, calculated to difplay the local and general cultoms of the ages in which they occurred. In $15+2$ the duke of Norfolk's officers were treated with "t two couple of rabbits," price $6 d$. ; a potlle of fack, $6 d$. ; a quart of fack and a quart of red-wine, $6 \mathrm{~d} . \ln 1544$, the " year's wages" of John Payne, one of the burgeffes in pariliament for this borough, was 63 fhillings. The two burgefles were paid 6l. ros. in the year 1555. The following year was dittinguifhed by the burning of four men, in this town, for "herefy." Here are a free grammar-fchool, a charity--Cliool, and feveral private charities. On the banks of the river Oufe, which is navigable for barges, are feveral iron-works, where eannon of fmall fizes, and feveral other articles, are calt.
Leves is 40 miles diitant from Chichefter, and 49 from London. Four fairs are held annually; and a weekly market on Saturdays. The population, in the year 1801, was ftated in the parliamentary return to be 3309 , occupying $\$ 12$ houfes. The fummer aflizes are alternately held here and at Horham.
A priory of Clunize monks, the firt and chief houfe of that order in England, was founded at Lewes, in ro78, by William lord Warren and Gundreda his wife. Here was alfo a priory of Grey Friars; and two hofpitals dedicated to St. James and St. Nicholas.

LEIVESTEIN, a town of Pruffia ; 16 miles N.W. o Ratitenburg.
LEIVIN, a town of Silefia, in the principality of Glatz; 15 miles W. of Clazz. N. lat. $50^{\circ} 14^{\prime}$. E. long. $16^{\circ} 4^{\prime}$.
LEWING, in Melallurgy, the fifting of the ores of metals in water. This is done in fine fieves moved backward and forward under water; and is the method of feparating the finer part of the ores which had fubfided among the larger. lumps, under that part of it feparated for ufe in the various wanhings. The coarfer matter, left in the fieve, is powdered agrain with the larger maffes, and all thus fifted together for the blowing-houre.
L.EWIS I.o in Biography, emperor and king of France, furruamed L: Dibonnaire, the fon of Charlemagne, by a fecond wife, was born in 778 , and while a child he was crowned king of A quitaine, to which ttate he was fent to refide. Inere he was carefully educated in the dead lan.
guages, and in the other branches of learning that were cultivated at that period. During his admimftration in Aquitaine, on account of the fuavity of his manners, he obtained the furname already mentioned; and at lis father's death in 814 , he fucceeded to the imperial throne, without oppofition. At this period he had three fons, Lothaire, P'epin, and Lewis, anong whom he divided his dominions: the firtt he railed to the dignity of emperor by afociating him with himfelf; the fecond he created king of Aquitaine; and to the other he gave the title and power of king of llavaria. A.worfe fyitem could not have been adopted, which becwis found to his coit, as each of his fons, feeling them:i-lves indeperdent of the father, violated every tie of filial and fraternal duty. Bernard, king of Italy, natural fon of Pepin, the eldert fon of Charlemagne, took up arms with the hope of depofing Lewis, but his army, in the critical momest, deferted him, and he was obliged to throw himfolf at the emperor's feet, to implore that clemency, which his mildeeds were ill calcu. lated to infpire. The einperor referved him to the affembly of the fates of Aix-la-Chapelle; by whom his conduet was inveftigated, and himfelf and affociates were condemned to death. This fentence was commuted for that of depriving the guilty of their eyes; the extreme torture of the operation was the caufe of Bernard's death, which happened almolt immediately after the crucl deed had been performed. The recollection of the fufferings of his nephew fo afficted the mind of Lewis, that he performed a public penance on account of it, a circumftance that rendered him contemptible in the eyes of his fubjects. The herce nations of the rorth, fcarcely to be controlled by the genius of Charlemagne, difdained the weak arm of his fucceffor, and it was with the ut. mof difficulty that their rude affaults were repelled, and themfelves confined within their proper circle. The molt difaftrous events of this pariod were the death of the emprefs, and the fubfequent marriage of Lewis with Judith, daughter of Guelf of Bavaria, whofe fpleidid accomplifhments concealed an ambitious mind, the fource of equal calamities to her confort and the empire. For a time Lewis was obliged to refign his power, but the jealouly of his three fons againit each other caufed a change in his favour, and he was again reftored to power. The three brothers, in $8_{32}$, joined in a new league againft their father; they were fupported by the pope, Gregory IV., and the emperor, deferted by his troops, furrendered himfelf a prifoner to his undutiful children. He was now folemnly depofed, the imperial dignity was conferred upon Lothaire, and Judith was fent into a nunnery. The misfortunes and diftreffes of the great ever affect the minds of the multitude, and the compaffion of his people foon began to operate in favour of the fallen fovereign. Pepin and Lewis took up arms againlt their elder brother, who was obliged to throw himfelf at the feet of his father, and alk his pardon. Lewis was again reconciled to the church, and replaced on the throne by the bifhops. He now recalled his emprefs Judith, whofe mind, unbroken by adverfity, engaged in new plots againtt the government, with the hope of advancing her fon Charles, to the prejudice of the other branches of the family. She had the addrefs to caufe him to be declared king of Neultria, and afterwards, on the death of Pepin, king of Aquitaine, in oppofiticn to the claims of the fons of Pepin. This circumftance induced Lewis of Bavaria to affemble an army, with the intention of feizing for himfelf as much of the territory bordering on his dominions as he could occupy. He accordingly made himfelf malter of the beft part of Germany: the unwelcome news was received by the emperor at a moment when his mird was broken down with age, and with terror occafioned by a total eclipfe of the fun: he withdrew from the feat of gover!

## L E WIS.

ment, to an inland in the Rhine, where he refufed almoft all fuftenance, excepting the elements adminittered at the facrament, and died at the age of fixty-two, in the year 840 . He appointed Lothaire his fucceffor in the empire, but his Lait moments were embitered with the molt lively refentment araint the king of Bavaria: he was reminded by the binhop of Mente that it was his duty to forgive; he replicd, "I pardon him, but tell him from me, that he mult feek pardon of God, for having broug'1: my grey hairs with forrow to the grave." The placid virtucs and the urbanity of tersper, which diftinguiferd the charneter of this emperor, very ill compenfated for the miferies which were engendered by his feeble adminitration ; and a prince, to whofe name has been added the epithet of gente, lived without the regard, and expired without the regret of his fubjects.
Lewis II, emperor and king of lealy, the eldent fon of tle emperor Lothaire I., was created by his father king of Italy in 844, and was fent to Rome, where he was crowned by pope Sergius II. In about two years he returned to Germany, and was affociated with his father in the empire. An irruption of the Saracens gave hin employment; he haftily went into Italy, and defeated them in feveral engagements. He afterwards called a council, to be held at Teffino, for the reformation of ecclefiaftical abufes. In $8 ; 5$, by the death of Lothaire, he fucceeded to the title of emperor, in addition to his kingdom of Italy. The repeated incerfions of the Saracens called forth his military talents and ardour, and the factions of his own nobility were a fource of much unealinefs and great diforders. He lived, in general, on good terms with the holy fee, and in $S_{1}-1$, was crowned king of Lorraine by pope Adrian II. He died in 8-5, greatly refpected by his fubjects, to whom he adminitered juitice with impartiality.

Lewis III. emperor, called alfo Lewis IV. was fon of the emperor is rnuif, whom he fucceeded when he was only feven years old, in the year 889 . During the courfe of his reign, Germany was defolated by the Hungarians, and torn afunder by civil difcord. He died in 912, and his death is regarded as an era in the Germanic hiltory, as he was the lail king or emperor of the race of Charlemagne.

Lewis IV or V. emperor, fon of Lewis, duke of Bavaria, and Matilda, daughter of Rodolph I., was born in 128 \& . By the death of his father, when he was only 12 ycars of age, his education devolved chiefly on his mother, and he dillinguifhed himfelf beyond all the princes of his age. In I3 14, he was chofen emperor at Frankfort by a part of the electors, while another part of them adhered to Frederic, fon of Albert, emperor and duke of Aultria. L.wis was crowned at Aix-la-Chapelle by the archbifhop of Mentz, while Frederic received a fimilar honour from the elector of Cologne. A civil war enfued, and in 1316 an indecifive battle was fought between them, at Efslinguen on the Neckar. In Italy, the Ghibelline faction efpoufed the canfe of Lewis, while the Guelphs fupported that of Frederic, and the flames of war \{pread over Lombardy, till at length he gave his rival a fignal defeat and took him prifoner. From this period thofe contelts commenced between Lewis and the holy fee, which difquieted all the latter part of his reign. The pope, John XXII., iffued a bull, affurning the right of deciding between the competitors of the e:mp:re, and commanding Lewis to defilt from exercifing the inp rial functions, till he fhould obtain his exprefs perreifion. The emperor protetted againlt the bull, and was excommunicated. To conciliate the minds of the German princes, he made a peace with the Auftrian family, and fet at liberty duke Frederic, whom he had hitherto kept in prilen. In 3327 , be marched into Italy, and was crowned
king of that country; and in the following year he pro. cecded to Rome, and was crowned at St . Peter's by the bifhops attached to his party. The pope renewing his bulls of excommunication and depofition againit him, he retaliated by publicly pronouncing his holinets a heretic, and a deferter of his flock; and he even pronounced upon him fentence of dcath. By a change of circumfances he was obliged to quit Rounc in hafte, and from this moment his caufe declined in Italy, and he found it neceffary to return into Gcrmany. He now fought a reconciliation with the pope, and was treated with contempt. The death of John, in $1 \hat{3} 36$, was of no advantage to the emperor, as the fucceeding pope, Benedict XII., perfevered in the hoftility manifetted by his predeceflor. About the year 1336, the princes of the empire, as well ecclefiaftical as fecular, aiffembling at Spirc, declared the empire independent of the fee of Rome, and pronounced Lewis the lawful emperor : after this a diet was convoked at Frankfort, in which a conItitution was paffed into a law, for ever eftablifhing the independence of the empire. Thefe decrees did not put an end to the difputes between Lewis and the holy fee: the breach was widened by the fecret inttigations of Philip of Valois; neverthelefs, the emperor retained the allegiance of the greatelt part of the empire. He died, as he was in the act of hunting, in October 1347, at the age of fixty-three. This prince is faid to have furpaffed all his contemporaries, both in perfonal and mental qualities, and accomplifhments. His manners were gay and highly polifhed for the times in which he flourifhed; and although he was capable of concerting his meafures without affiltance, he willingly fought the aid of good counfel. He appears to have been famed for piety; for, notwithftanding the papal anathema, he received the appellation of "Molt Chriltian," and the monks of Germany, as fervile, as fuperftitions, preferved his knives, napkins, \&c. with religious veneration. Modern Univer. Hift.
Lewis I. king of France, has already been noticed under the firtt emperor of that name, having reigned as chief of the Germanic empire, and monarch of France. We therefore proceed to
Lewis II. king of France, furnamed the Stammercr, fon of Charles the Bald, who was born in 843 , created king of Aquitaine in 867 , and fucceeded his father in the throne of France in 877 . This prince expofed his kingdom to the fatal confequences of a weak and divided adminiftration. To obtain the fupport of the principal people, he profufely lavifhed the honours and eftates of the crown upon thofe who made the earlieft application, fo that having exbaufted his bounties, thofe who were the laft to prefent their claims were difappointed in their hopes and expectations. Neglected themfelves, they murmured, and denied the right which he had alfumed of difpofing of thefe poffeffions, without the confent of the general affiemblies. His party prevailed by the force of numbers; and at his coronation he took a folemn oath to maintain the privileges of the grandees, and to refpect the donations which he had conferred on them. The vaffals of Lewis foon became his equals, and contended for the fuperiority. A rebellion caufed him to take the field in his own defence, but on his arrival at Autun. he was attacked with a dangerous difeafe, fufpeted to have been occafioned by poifon, which carried him off, after a reign of about eighteen menths. At the time of his death the queen was pregnant, and was afterwards delivered of a fon, who in due time fucceeded to the kingdom, under the title of Charles the Simple. Previcufly to his death, and fenfible of his approacting end, he defired that his fword and crown might be delivered to his fon,

## L E WIS.

Lemes III. king of France, who was at that time about Seventeen years of age. The great lords were defirous, int oppofition to the wifhes of the late fovereign, to eftablif? his other fon Carloman on the throne 'To prevent, however, the evils of a civil war, they agreed that the crown thould be worn by both. The divifion of territory was made in 880, when Lewis had for his flaare France Proper, and Neulria; and to Carloman were affigned Burgundy and Aquitaine. The two brothers lived and reigued together in the molf perfect harmony, and they difplayed fome of the qualities of their anceftor Pepin. They, in fome meafure, put a flop to the ravages of the northern brigands, fifty thoufand of whom had entered by the river Somme, and had taken feveral ftrong places, among which was Amiens. Lewis defeated them in an engrgement near Courtray, but having neglected to follow up his victory, they rallied, and made incurfions into Picardy; here he again encountered, and gave them a molt fignal defeat, leaving on the field of battle 9000 of the enemy, with their leader Guaramond. This victory had difplayed much wifdom and valour ; and the demife of Lewis of Germany proclaimed the moderation of the young king of France, who rejected with firmnefs the crown offered him by the inhabitants of Lorraine, and yielded to the fuperior pretentions of the emperor, Charles the Fat. The French were, however, permitted to contemplate the rifing virtues of their prince only a fhort time. While he was indulging the hope of crecting frefh trophies over the Normans, a mortal difeafe compelled him to renounce the enterprife. He returned to St. Denys, where he expired in the twentyfecond year of his age. His premature death was marked with the fufpicion of poifon, a fufpicion countenanced by the turbulent temper of the nobles, jealous of his active and glorious reign.

Lewis IV. king of France, furnamed D'Ontre-mer, beyond the fex, on account of his having been educated in England, was the only fon of Charles the Simple, by Egira, daughter of Edward the Elder. He was born in 917, and upon the depofition of his father, was taken by his mother to the court of Athelltan, in Enigland. Here he remained tith the year 936, when he was invited to return and afcend the throne of his anceftors. He landed at Boulogne, proceeded to Laon, and was crowned in that city by Artaud, archbifhop of Rheims. His return was chiefly owing to the influence of the powerful Hugh the Great, duke of France. The firl meafures of Lewis promifed to maintain the internal tranquiliity of his kingdom. To difcharge his obligation to Hugh, and to fecure the fidelity of that nobleman, he appointed him minifter, and committed the reins of government into his hands. The fervant foon raifed himfelf above the - mafter ; and the attempts which Lewis made to free himfelf from this ftate of dependeuce, gave rife to a civil war, which for feveral years threw the kingdom into confufion, By the mediation of Otho, his brother-in-law, emperor of Germany, and that of William, duke of Normandy, a peace was concluded in' 942 , betweert Lewis and his rebellious fubjects. On the death of the duke of Normandy, Lewis attempted to add that duchy to the kingdom: for this purpafe he united with Hugh the Great, in an open invafion of the country. Lewis was entirely defeated and carried prifoner to Rouen, whence he was not releafed till he had entered into a treaty to fecure the independence of Normandy; even after this he was detained in captivity till he had procured for himfelf a grant of the city and territory of Laon. Lewis feized upon the firf opportunity to avow his refentment againft his powerful vaffal, and the provinces of France were alternately aflicted by the arms of Lewis,
of Otho, and of Hugh.' During five years the flames of civil war raged without intermifion, and the precarious. peace which was concluded in a perfonal interview, may be confidered as a fufpenfion of hoftilities rather chan a reftoration of tranquillity. The latent embers of difeord were ftill kept alive: they broke ont with renewed violence, and were finally extinguifhed by the two lifters, conforts of the king and Hugh. A permanent peace was efablithed, and Lewis prepared to affert his authority over the revoited lords of Aquitaine, when his plans were broken by a fudden and accidental death. As hie was purfuing a wolf, roufed by chance, with inconfiderate ardour, his horfe ftumbled and threw him: the injury proved fatal, and in a few days he clofed his life at Rheims, after a flormy reign, having been eighteen years on the thronc.
Levis V. was affociated with his father Lothaire in thegovernment, whom he fucceeded in the year 986, being in the nineteenth year of his age. He maniffefted a violent and turbulent character : he quarrelled with the queen-dowager ; expelled the bifhop of Laon from the kingdom; and upona difpute with the archbifhop of Rheims, forcibly entered that city with a confiderable flaughter. At the time that he was preparing to march againft the Saracens, he was taken off by poifon, adminittered, it was imagined, by his own wife Conftance. With him ended the race of kings of the houfe of Charlemagne, which had fiwayed the fceptre nearly 240 years.

Lewis VI., furnamed Le Gros, fon of Philip I., was born in 108t. He was affociated with his father in the government in the year 1100 , having already acquired a high reputation for valour, prudence, moderation, and a freedom from thofe vices incident to his age and rank. By the vigour of his conduct he held in awe the difcontented nobles, repreffed the rebellious, demolifhed their cafles, and compeiled them to reftore the eftates which they had ufurped from the clergy. His mother-in-law, Bertrade, jealous of the reputation of the young prince, and confidering him as the only obllacle to the clevation of her own fons, attempted, by every means in her power, to deftroy him. He happily efcaped her machinations, and Philip, difcovering her real character, forced her to make fuch fubmifions as difarmed the refentment of his fon. In nio8, Lewis, by the death of his father, fucceeded to the throne, and in a fhort time he became engaged in a quarrel with Henry I., which may be regarded as the commencement of the long contelts between. the kings of France and England. Lewis, in the firit inflance, winhing to avaid the effufion of blood, fent a challenge to Henry to decide the point at iffue in fingle combat, which Henry declined. A battle enfued, Lewis was. victorious, and in a treaty concluded not long after, it was agreed that William, the fon of Henry, fhould do homage to the fovereign of France for the duchy of Nornaandy, which Henry himfelf had refufed to do. War was again renewed, and in an attion at Brenneville, an Englifh warrior feized his horfe's bridle, crying, "the king is taken ;" to which Lewis replied, "at chefs, the king is never taken," and inftantly laid his antagonift dead with his fword. Lewis endeavoured to deprive Henry of the dukedom of Normandy, but was unfuccefsful. In I1Ig, at a council at Rheims, in which the emperor Henry V. was excommunicated by pope Calixtus II. Lewis lodged his complaints againtt the king of England, but was unable to draw down the cenfures of the church upon him. After this the emperor, excited by Henry I., who was his father-in-law, invaded France, but the common danger induced the French to rally round the ftanfard of their king, and he flortly found himfelf at the head of $200,000 \mathrm{men}$. It was at this

## LEWIS.

crifis that the famous oriflamme, or banner of the abbey of St. Denis, was difplayed as the king's flandard. Lewis next had a difpute with fome of his prelates, which brought upon him a fentence of excommunication from the bifhops of Paris and Sens, but it was taken off by the pope. He now attempted to put an end to the fchifm in the popedom between Innocent 11. and Anaclet, the former of whom he fupported as lawful pontiff. The grofs habit of his body, from which he derived his furname, forewarned him of his approaching end, for which he prepared by fettling the affairs of his kingdom. He caufed his fon Lewis to be folemnly crowned, and when he found himfelf almolt in the laft flage of exiftence, he drew the lignet from his finger, and fixed it upon that of his fon, charging him at the fame time to remember, that the fovereign authority, of which this was the fymbol, was a public truit, for which a frict account would be required in a future world. He died in 1137, greatiy lamented by his people, whom he had never burthened with taxes, and whom, in many refpects, he had freed from the oppreffions of the great. Lewis VI. was unqueltionably one of the moft irreproachable monarchs of France. His reign is reckoned the era of the commencement in France of that balance to the power of the feudal lords which arofe from the order of citizens. He conferred new privileges on the tawns within his domains, by what were entitled charters of cominunity, and formed them into corporations or bodies politic, with the right of adminitering jutice, levying taxes, and embodying a militia within their own diltricts.

Lewis VII., fon of the preceding, was born in-1120, and fucceeded to the throne in 1137 , having by his marriage with Eleanora, the heirefs of the duke of Guieune and count of Poitou, united to the crown of France an extenfive country from the Loire to the Pyrences. He began his reign by repreffing fome outrages of his nobles, and a revolt of the commons. The electiou of ain archbihlop of Bourges, without his confent, involved him in a quarrel with the clergy, and with pope Innocent II. who fupported them. In the courfe of this difpute, Lewis made an inroad into Champagne, facked the town of Vitri, and fet fire to a church, in which more than 1300 people miferably perifhed. Struck with remorfe for this favage act, he refolved to expiate the foul crime by an expedition to the Holy Land. In 1 if ${ }^{6}$, Lewis took the crofs, and his example was followed by the queen, and all the principal nobility. In the following year he fet out at the head of So,000 men, on his march by land to Conltantinople: from this city the French army marched through Afia Minor, to Antioch, and at length undertook the fiege of Damaicus. The enterprize entirely failed, and Lewis returned difpirited and difgraced. To public calamity fucceeded the pang of domeftic mifery, and it could not be concealed from the eye of a hufband that the fidelity of his queen, who had accompanied him in this expedition, had been facrificed to her own uncle, Raymond. Ow his return he determined to divorce himfelf from the queen, which he carried into effect in 1152. By this event the provinces of Aquitaine were detached from the crown of France, and in fix weeks they were transferred to that of England by Eleanora's marriage to Henry Plantagenet, then duke of Normandy, and foon after king of England, under the name of Hemry II. The facility with which he parted from thefe wealthy provinces has for ever annexed to him, by way of reproach, the furname of Yountr. Lewis married for a fecund wife Conftantia, daughter of Alphonfo, king of Caftile, and foon after difplayed his picty in a pilgrimage to the fhrine of St. James, at Compoftella. This ipueen dying without any male iffue, he married Adelaide,
daughter of his old enemy, Thibauld, count of Champagne, by whom he had a fon, named Philip. While a mere child, the royal youth, cngaged in the pleafures of the chace, was loft in the thickneffes of a gloomy fereft, and the heir of France was condemned to pafs a tedious night, oppreffed by folitude and depair. His feeble mind was incapable of fuitaining the horror of his fituation, and when found in the morning, a dangerous fit of illnefs was the effect of the fright. The fupcrititious monarch vifited the tomb of Becket, to folicit the interpofition of a faint, who had experienced his earthly protection. Having been kindly received at Canterbury by Henry, and having prefented his offerings at the fhrine of 'Thomas, he embarked again for France, and on his arrival his heart was gladdened with the intelligence of his fon's complete recovery. The mind of the king had, however, received a blow, from the effects of which he never recovercd, and in 1180, he experienced a paralytic feizure. Senfible of the great danger which hung over him, he determined to halten the coronation of his fon, and having languifhed about a year under his malady, he expired, after a reign of forty-three years. " If," fays the hiltorian, "the prudence and judgment of the king, in refloring the dowry of Eleanor have been arraigned, his humanity has been feldom, and his piety has never been impeached. A tender hulband and an affectionate father, the errors of the monarch, were lolt in the virtues of the man."

Lewis VIII., grandfon of the preceding, was born in ${ }^{118} 8$, and difplayed, at a very carly age a martial difpofition under his father at the war in Flanders, and againft king John of England in Poitou. In 1216, he was invited by the barous of England to afcend the throne, of which their own fovereign had proved himfelf unworthy. He landed in Kent, and marched to London, where he was at firft received with refpect and gratitude : in a very fhort time the tide of public favour completely turned, and he was glad to obtain permiffion to return unmolefted. He fuccceded to the crown of France in 1223, and farcely had afcended the throne of his anceftor, when he was urged by Henry 1II. of England, to make reflitution of the provinces taken by his father from king John; he refufed, and war was dectared. Lewis was every where victorious, and the power of the Englifh in France was greatly curtailed, fo that nothing was left in their poffeffion but the town of Bourdcaux, and the country beyond the Garonne. To preferve thefe, Henry conferred on his brother Richard the title of count of Poitou, and furnifhed him with ample means to fupport his new dignity. The inhabitants of Poitou crowded to his ftandard, and the fpirit of oppofition being revived, the career of Lewis was checked, and he was glad to make a truce for three years. The court of Rome flrongly folicited the king of France to refume the crofs, and to march againtt the Albigenfes. From Lyons he directed his march along the banks of the Rhone, and invelted Avignon with 50,000 men. 'Tlke inhabitants, animated by defpair, defended themfelves with the moit obttinate valour ; and the king, after the lofs of the bravelt of his troops, was forced to grant that capitulation at laft, which he had refufed at firtt. On his return home, he was feized with an illnefs which put an end to his life, in November, 1226, after a reign of about three years.

Lewis IX., king of France, named Saint, fon of the preceding, was born in 1215 , and fucceeded to the crown in 1226: being only in the twelfh year of his age he was placed under the guardianfhip of his mother, Blanche of Cattile, who was nominated regent of the kingdom. Her firt efforts with regard to the young king was to infpire him with a love of religion, and an attachment to the prin-
ciples of pure morality. When he attained the alye fit for taking upon himfolf the rule of the kingdom, fuch was the refpect which he bore for his mother, that her authority remained unimpaired, and for feveral years they may be faid to have reinned jointly. Though the piety of this prince obtained for him the title of faint, yet he knew the limits bet ween fecular and ecclefiaftical jurifdictions, and was jealous of ufurpations in the latter. We refufed to join in the crufade recommended by pope Gregory IX., though encouraged to the undertaking by the molt flattering propofals. Lewis fhewed himfelf a good warrior by his exertions in fupprefling a revolt fupported by Henry 1II. of England : he gained two victories in perfon, and conttrained his rival to fubmit to humiliating conditions of peace. Two regula. tions proclaim the prudence and policy of this prince. The firit, under pretence of preventing ftrangers from inheriting lands in France to the prejudice of the natives, prechuded the nobles from marrying their daughters to foreigners, and reftrained them from increafing their influence by connections and alliances with the neighbeuring powers. The fecond compelled the valfals of the crowns of France and Eng. land to make a public avowal, as to which fovereign they would do homage; and, tinally, abolifhed the dangerous cuftom of adhering to either, as their caprice or intereft fuggefted. Yet, even in this edict, the humanity of Lewis was confpicuous, and his juftice indemnified thofe who achered to him for the land they forfeited, by feceding from the king of England. A dangerous indifpofition, which menaced the life of Lewis, was productive of a fatal vow to march in perfon againlt the infidels, whofe fucceffive vietories had overwhelmed the Chriltians of the Eaft : no remonitrances from his counfellors, his nobles, and even his prelates, could divert him from the refolution of fulfilling his vow. The blind zeal, however, which induced him to defcend from his throne to feek the adventures of a fpiritual knight-errant, did not prevent him from concerting his meafures with the utmolt prudence and forefight, as well with refpect to the enterprize itfelf, as the government of the realm during the king's abfence. Having entruited the kingciom to his mother, Blanche, he prepared for his departure. "To furnihh," fays the hiltorian, "f an armament equal to the arduous enterprize, France was exhaufted of troops and treafures; the fea was whitened with eighteen hundred fails; and nine thoufand five hundred horfe, and one hundred and thirty thoufand foot, have been computed as the number of the martial pilgrims. The fleef, with favourable winds, reached the coaft of Cyprus; the troops were difembarked on the friendly fhore, and during the feverity of winter, their flrength was recruited and their health reftored by the plenty of that inand." Here it was determined to make war firlt upon the fultan of Egypt, for the purpofe of facilitating the recovery of Paletine. In 1249 , he arrived at the mouth of the Nile, and leaping into the fea, fword in hand, gained the beach, and drove away the Saracens drawn up to defend it. Damietta inAtantly yitided to the aggreffor, but it was now found the expedition was ill-timed: the rifing of the Nile prevented his farther advance, and the delay introduced difeafe into his army, and all the diforders naturahy atteneant upon idtenefs and the want of fubordination. From this period he was no longer fuccefsful : every new attempt at conqueft ended in difalter, till at length himfelf, his brothers who had accompanied him in the expedition, and his whole army, were under the neceffity of furrendering themfelves prifoners. The enemy fcarcely knew any bounds to their revenge: they maffacred the captives without mercy, and even treated the fallen monarch with a great degree of infolence and ri-
gour, to which it is faid he fubmited with firmnefs and dignity. The king was at length libcrated, having firtt agreed to pay a ligh ranfom, and to agree to a truce of ten years between the Chriltians and Mahometans in Egypt and Syria. 'This treaty was punctually execued, and if high was the honour of Lewis, that upon difcovering a contiderable miltake made by the Saracens in the value of the money to their own lofs, he caufed it to be rectified. He left the country with his queen and brothers, and carricd with him about 6000 men, the fole remains of the valt army which he had collected in the ourfet of the bulinefs. He embarked for Paleftine; and though it might have been expected, that, after his late misfortunes, he would readily have relinquifhed the vain hope of eaftern laurels, and returned to the government of his own kingdom. yet he feemed unwilling to revifit his dominions without glory, trulting for tranquillity at home, in the vigilance and fidelity of his mother Blanche. His ambition now was to fecure Jerufalem from the hollilities of the Saracens; with this view be repaired the fortifications of the places till poffeffed by the Chriltians, made pilgrimages of devotion, attempted converlions, and funk the character of a mighty monarch into that of a fupertitious crufáder. News was brought him of the death of his mother, who had undergone much difquiet from various circumflances during the abfence of her fon, and whofe grey hairs were brought with overwhelming forrow to the grave. The king was now obliged to return, and in his paffage the vefiel which carried him and his family ftruck upon a rock, and was in the moft imminent danger; neverthelefs, the fortitude of the monarch was fo great, that he refufed to avail himfelf of another fhip, determining to fhare the fate of all who were expofed to fimilar rifks with-thofe that threatened his own life. On his return, he was received by the acclamations of the people; his drefs was plain; and his features were impreffed with melancholy; the former ftill bore the fign of the crofs, the latter evidently difplayed the marks of defeat. The magnificence of the monarch was, however, beheld with admiration in his reception of Henry III. of Eugland, who embraced the opportunity of an expedition into Gafcony, to vifit Paris. The fplendour of his entertainment was enhanced by the courteous manners of Lewis; and the interview between the two kings was followed by a renewal of a former truce for two years longer. He began to apply himfelf with all diligence to the government of his kingdom, by his ftrict and impartial adminitration of juftice. In the fimplicity of ancient manners, he was accuftomed to Seat himfelf under a fpreading oak at his caftic of Vincernes, and there, in perfon, to decide the caufes that were brought before him. He protected the lower orders from the oppreffions of the great, and would not fuffer his own brothers to pafs over the limits of law and equity. He was extremely fevere in every thing that regarded religion; and the edicts which he iffued againt blafphemous and impious perfons, as thofe were called who doubted the truths of an eftablifhed faith, might have been worthy of a bigotted inquifitor. So great was his character among fureign nations for equity, that he was often applied to for a fettlement of difputes between kings and their nobles. The barons of England and Henry III, in their difputes, agreed to make Lewis the arbiter ! his decifion was favourable to the reral authority, but with a large refervation of the rights and privileges of the fubject, fo that, in fact, it determined nothing. He enlarged his own kingdom by the acquifition of various places on the borders of the Low Countries, and he acquiefced in the pope's donation of Naples and Sicily to Charles of Anjou, brother to Lewis. At length the zeal for propagating his religion feized again upon the mind of

## LEWIS.

Leeris: the latent fame of collufiafin which had been damped by his defeat in Egypt was not extinguifhed; ard an opportunity was only wanting to revive the dormant embers. 'The wifdom of his regulations had reftored the tranquillity of hit dominions: his coffers were recruited, his finances augmented, and his lopes of fuccefs were expanded, and very fanguine. His filent preparations had heen incesfantly directed towards the fingle object of his devout ambition; the lofs of Antioch provoked the more immediate execution of his defigns. His example was followed by his three fons, by his nephew the count d'Artois, and by a multitude of the molt gallant firits of the court of France. He entrulted the reins of government, during his abfence, to the vigilanee and fuperintendance of Matthew, abbot of St. Denys, who derived his noble lineage from the counts of Vendome ; and to Simon de Clermont, count of Nefle, A fea-port of Languedoc, near the mouth of the Rhone, was rendered a fecond time remarkable by the embarkation of Lewis, and the fleet of France itecered immediately for the coall of Africa. An obfeure king of Tunis had pro. feffed an inclination to abjure the tenets of Mahomet for thofe of Chrilt ; and the vain report of an immenfe treafure reconciled the more interefted pilgrims to the wild and vilionary enterprifc. But caprice or policy had already united the fickle or crafty barbarian to the precepts of the Koran; and in Itead of a zealous profolyte, Lewis encountered an active and formidable enemy. The walls of Carthage were, indeed, Itormed by the impetuous valour of the French; but their flrength was exhaufted before the gates of Tunis; and the warriors of the welt panted beneath the fultry heats, and expired on the burning fands of Africa. The king himfelf was infected by the pellilential blaft, and he breathed his latt on the inhofpitable floore, in the $44^{\text {th }}$ year of his reign. In his fingular character were united the virtues of the faint and the hero: his piety and equity in peace were not more confpicuous than his fortitude and valour in wat. The father of his people, his heart fympahized with their miferics, and his hand was ever ftretched out to relieve their dilltrefs. His excellent underftanding was clouded by the fumes of enthuliafin; and the flaughter of his fubjects, his own captivity, and at length his death, were the fatal confequences of a blind fuperitition. Pope Boniface VIII. canonized him in 1297; and his defcendant, Lewis XIII., procured the day, dedicated to his honour, to be declared a general featt of the church.
Lewis X., furnamed the Boiferous, from the rude promife of his infant years, fon of Philip, was born in 1291, and fucceeded his father in 1314 . Hr, in a fhort tires after his coromation, caufed his firlt wife to be ftrangled in the prifon of Chateau Gailard, where the was confined, and endeatoured to forget the vices of a licentious woman in his nuptials with Clemence, the daughter of the king of Hungary. An empty treafury delayed, for fome time, the ceremonies of the coronation, and the king diligently applied himfelf to concilinte the jealoulies and appeafe the difcontents of his new fubjects. Jeexis, notwithitanding the furname which he had acquired, was of a quiet difpolition, and furrendered the chief authority in the thate to his uncle, Charles of Valois. The firances of the king dom having fallen into diforder, the fuperintendant, Euguerand de Mlarigni, was made a tacrifice to the revengeful paffions of the new minifter. Marigni vindicated his charafter with vehemence; but his eloquence was of no avail, he was configned to an ignominiuns death on the gibbet, and his fortunes were confifcated to the ufe of the fovereign, and were applied to defray the expences of the coronation, which was celebrated at Rheims; and as nuch as they fell flort of public expectation, fo much
did the deficiency contribute to eftablin the innocence of the unfortunate fuperintendant. Far different fupplies were neceffary for the fupport of a war with Flanders, which Lewis was defirous of engaging in, and he accordingly propofed to raife the neceffary fupplies by a general enfran. chifement throughout the kingdom. The inhabitants of the towns were already frce, but thofe of the country were not fo, and few were found willing to pay for that freedom which was forced upon them. The decree was, however, gone forth, and they were compelled to accept of their liberties upon the terms-propofed by the fovercign, who prefaced his edict with thefe words: "Since, according to natural right, every perfori onglit to be free, \&c." a maxin not very confifent with the compulfory purchafe of liberty. The money being provided, Lewis made a campaign againft de Bethune, count of Flanders, who, feeling himfelf unable to withftand the army brought againft him, determined to bend againtt the florm. By the fpecious language of fubmiffions, he involved the king in a feries of frutlefs negociations, till the feafon of action was paffed, and the lirench army was obliged to rctreat, withont obtaining any advantage. While the king, indignant at the arts of his adverfary, was meditating new projects for revenging himfelf upon his adverfary, his defigns were interrupted by death. A fudden diforder, imputed by fome to poifon, by others to drinking a glafs of cold water when he was heated, proved fatal to him in June, 1316, after a reign of about a year and a half.

Lewis XI. fon of Charles VII. was born in 442 , and at an early age difplayed confiderable talents, united to a turbulent difpofition. At the age of feventeen he headed a party of difcontented nobles, who engaged in a petty war, which was foon fuppreffed, and the prince was glad to fubmit. After this he reinftated himfelf in the royal favour by his fill and valour in relieving Harfleur, inveited by the Englifh. He was foon fent with a body of troops to affif the duke of Auftria againft the Swifs, and obtained fone advantages over them, which were fucceded by a negnciation with the Cantons, in which be concluded the firt treaty between them and the crown of France. In I446, difgutted with the afcendancy of Agnes Sorel, his father's miltrefs, he left the court, and retired into Dauphinè, in which province he excrifed the fovereign authority. He ettablifled the parliament of Grenoble, made laws, and even coined money. At length his conduct created fo much uneafinefs in the brealt of his father, that he was determined to get poffeffion of his perfon; but the pringe, being made acquainted with his intention, efcaped, and took refuge in the court of Philip the Good, cuke of Burgundy. Here he was treated in a manner confiltent with his rank; but Philip would not encourage any of his feditious projects. In the mean time the king brought back the government of Dauphinè to its ancient form, and kept a watchful eye over his fon's motions: fo jealous was he of his intentions, that the dread of being poifoned by his contrivance was the caufe of his death. In the year 1461, Lewis received the news of his acceffion to the crown of France; he did not affect to conceal the joy which the intelligence excited in his breall. The competition of his younger brother, the duke of Berri, vanihhed at his appearance, and his own coronation was celebrated with valt magnificence at Rheims, and honoured with the prefence of Philip, his noble hoft, and that of his fon, the count of Charolois. The firt emotions of the king's gratitude for the protection he had met with, was difplayed in his declaring the count his liev-tenant-general in Normandy, with a very munilicert falary; but thefe marks of elleem and confidence foon vanifhed, and
were fucceeded by an enmity between thefe rival princes, which only expired with life. The new king immediately 'difmifed the miniters of his father with difgrace, and at the fame moment releafed from imprifonment the duke of Alençon, who had been confined for treafonable practices. With regard to foreign potentates, his conduct feemed to be deftitute of every principle of jultice, and dictated merely by what appeared to be the intereft of the moment. In pope Pius II. he met with a politician more refined than himfelf, for in the hope that this pontiff would affif in replacing the houfe of Anjou on the throne of Naples, Lewis cancelled the pragmatic fanction of his father, which eftablifhed the liberties of the Gallican church : afterwards, finding himfelf deceived in his expectations, he permitted its execution in certain points. Being conftituted mediator in a difpute between the kings of Cattile and Arragon, he had an interview with the former, in which he difplayed the fingularity of his difpofition: for while the Spanih monarch with his attendants difplayed the greateft magnificence in their apparel, he appeared in a drefs of coarfe cloth, with an old hat upon his head, upon which was fluck a leaden image of the Virgin: This contraft infpired them with mutual averfion, and the two kings, after a fruitlefs conference, returned with a thorough contempt of the fordidnefs of the one and the incapacity of the other. It was a great object of his policy to reduce the formidable power of the houfe of Burgundy; and, in the execution of his plans, he was furpected of a plot for the feizure of the perfons of the duke and his fon. In return, the count of Charolois joined the duke of Brittany in caballing with his difcontented nobles, and formed a confederacy, called "the league for the public good," into which the king's brother, the duke of Berri, entered. The revolters took up arms, and the count attempting to furprife Paris, an engagement took place at Monthèri, in which the wietory remained undecided. Paris was, however, befieged, and the king, to avert the danger, followed the advice of Sforza, duke of Milan, which was to break the lexgue by liberal promifes, and trult to events for eluding the execution of them. He accordingly agreed to a difgraceful treaty in 1465, by which he ceded the duchy of Normandy to his brother, and granted lands out of the royal domains to others of the leaders. Some difputes between the dukes of Brittany and Normandy gave him an opportunity of recovering his power, and of divefting his brother of the dukedom of Normandy, and of that which he before poffefled. The acceffion of the count of Charolois to the dukedom of Burgundy on the death of his father Philip, gave Lewis much uneafinefs. The fiery temper of that prince, and his declared enmity to the king, involved them in perpetual hoftilities. In the courfe of thefe, the king's brother, whom he had been obliged to make duke of Guienne, died, not without fufpicion of poifon, and the duke of Burgundy, openly accufing Lewis of fratricide, refumed his arms. An jnvafion of France by the duke's ally, Edward IV. of England, threatened great danger ; but Lewis, adhering to his favourite principle of diverting rather than confronting a ftorm, lavifhed his treafures upon Englifh minitters and geserals, and ailured Edward himfelf by a promifed penfion of 50,000 crowns for life, by which means a treaty between them was concluded in 1475. The duke of Burgundy made a feparate peace afterwards. Having thus extricated himfelf from foreign foes, Lewis indulged his fevere difpofition in taking vengeance on domeftic traitors. The conftabie St. Pol, who had ferved under and betrayed both him and the duke of Burgundy, was brought to the fcaffold, as was likewife the duke of Nemours. The cruelty of making
the innocent children of the latter nobleman itand mume w. fcaffold, at his execution, that they might literally the fyrinkled with their father's blood, infpired univerfal horror and general deteftation of the tyrant who could devife fuch a deed. In Ity 6 , Lewis was delivered from his molt danger ous enemy Charles, who fell before Nanci; and he felt no fcruple in making all.poffible advantage of this cvent, to the prejudice of the heirefs, Charles's only daughter, Mary of Burgundy : but his attempts againft her were unfucceffful, and Flanders and Artois declared for the duchefs. Another fcheme which Lewis meditated, was to oblige Mary to marry the young dauphin, but his hoftile procedure had the effect of throwing her into the arms of Maximilian, archduke of Auttria, an event which proved the fertile fource of war for centuries. A war was the inmediate confequence of this alliance, but mutual convenience foon brought about a fufpenfion of arms. Lewis then turned his attention to the neighbouring ftates, and managed feveral negociations with his wonted dexterity. He provided for the fecurity of the family and dominions of his deceafed fifter, the duchefs of Savoy; he fupported the houfe of Medici againft pope Sixtus IV., made an alliance with Ferdinand and Ifabella, and renewed his treaty with Edward IV. One of the laft public events of this reign was the union of Provence to the crown of France, by the bequeft of Charles, count of Maine, the laft prince of the houfe of Anjou. Lewris had now attained to a flate of great external profperity, was regarded throughout Europe for his power and dextrous policy, and feared by thofe who did not efteem him. The decline of his health, and the dread of death, filled him with jealoufies and fufpicions relative to his temporal authority. The nearer he approached his end, the more he clung to life; and he endeavoured, by fuperfitious practices, to quiet the upbraidings of a guilty confcience. He had a ftrong guard round his palace, who kept at a diftance all vifitors, except a very few, whom he permitted into his prefence fingly. He changed his domeftics every day, facrificed many to his fufpicions, and felt more dread than he infpired. "The walls of the cafle," fays the hiftorian, "were covered with iron fpikes, a guard of crofs bow-men watched the gates and ramparts night and day, and the guilty tyrant heard his enemies in every paffing wind." Earth was in vain ranfacked to revive his jaded appetites; heaven was invoked with prayers and proceffions to avert his impending doom; all hope was fled, and his favourite, Oliver le Dain, pronounced to him the fentence of certain and approachirg diffolution; the king heard him without betraying any emotions of terror: he fent for his fon Charles, and employed his laft moments in advifing him to cherifh the princes of the blood; to govern by the counfels of his nobles; to maintain the eftablifhed laws of the kingdom; and to diminifh the extraordinary impoits with which he had burdened his fubjects. This laft effort exhaufted the ftrength of the fainting monarch, and he died, after a reign of twenty-three years, in Auguft 1483. Dreaded by his fubjects, whom he had continually oppreffed, and detefted by his neighbours, whom he had affiduoufly deceived, he yet obtained from the obfequious temper of the reprefentative of St. Peter, the title of Chrifo tian King, a title that was ever after held by his fucceffors. He inftituted the order of St. Michael. He was author of feveral ufeful eftablifhments, and the adminithtration of jufice was generally pure where he himfelf was not concerned.
Lewis XII., fon of Charles, duke of Orleans, defcended from Charles V., was born in 1462 : he married Joañ, daughter of Lewis XI., and at the death of that monarch, in 1483 , and the acceffion of Charles V1II. he ftood as prefumptive heir of the crown, with the title of duke of Or.

## L E W IS.

leans. On the death of Charles, in 149 S , he fucceeded to the crown without oppofition. Among the very earliefl efforts of his reign were his attempts to diminifl the taxes levied upon the people. He is alfo celebrated at this period for the well known fentiment with which he quieted the apprehenfions of his enemies. "It is," faid he, "not for the king of France to revenge the injuries done to the duke of Orleans." Turning his attention-to the daties of his new ftation, he introduced various reforms into the civil adminiftration and military difcipline, exhibiting at the fame time a fteady mind in every thing which he undertook. He was anxious to obtain a divorce from his wife, the daughter of Lewis XI., becaufe, being deformed, the was not likely to bring him any children, and alfo, becaufe he wifhed to efpoufe Anne of Brittany, widow of the late king, who had refumed her duchy. The pope, Alexander VI., was ready to favour him on this occafion, in order that, in return, he might obtain an eftablifhment for his natural fon, Cæfar Borgia. On the oath of the king of France, that he had never confummated the marriage, the holy pontiff declared the union void and illegal. Jane lubmitted with decent refignation to a fentence which deprived her of a crown, retiring to a nunnery, in which the took the veil, and clofed a life of humble virtue; and, in January 1499, he was married to Anne of Brittany. The queen, though willing to afcend the throne of France, was anxious to fecure the independence of her native duchy, and flipulated, that if their union fhould be productive of two fons, the younger fhould inherit Brittany, with all the prerogatives of its former princes. This agreement proved ineffectual, by her having no fon, and by the marriage of her eldelt daughter Claude to Francis, count D'A ngoulefme, who afterwards afcended the throne. The claims of Lewis upon the Milanefe, and the kingdom of Naples, new began to excite in his breaft the ambition of conqueft ; he accordingly made an alliance with the Venetians, and, in conjunction with them, invaded the dominions of Ludovico Sforza, duke of Milan. The French generals, in the fhort fpace of three weeks, made themfelves mafters of Milan, Genoa, and all the ftrong places in the country: Lewis entered Milan in triumph, while Sforza retired with his family and treafures to Infpruck. A fudden revolution caufed the expulfion of the French, and the return of the duke, but the troops of Lewis fhortly entered the Milanefe, and got poffeffion of the perfon of the duke, who was fent into France, where he died. Lewis now made a treaty with Ferdinand of Arragon, for the partition of the kingdom of Naples between them. In 1501 this plan was fucceiffully executed, and Frederic, king of Naples, expelled from his dominions, put himfelf into the hands of Lewis, as the molt generous of his two enemies. Ferdinand was not content with a part of the conqueft, but took every method to fecure to himfelf the whole fpoils; and by means of his famous captain, Gonfalvo de Cordova, obtained poffeffion, in 1503 , of the whole kingdom of Naples, after defeating the French at Seminara and Cerignole. It was on this occafion that Gonfalvo got pofferfion of the young prince, whom be conveyed to the king of Arragon, and though treated with lenity, he was for fifty years the captive of the court of Spain, till Death, that lait friend to captives, extinguifhed in him the Arragonefe line 'of Neapolitan kings. In the year 1507, a revolt of Genoa called Lewis, in perfon, into Italy with a powerful army ; he entered it as a conqueror, feemingly bent on vengeance, but his natural clemency was difplayed in a moderate chaftifement which he inflicted upon it. In the following year he joined the famous league of Cambray againit the Venetians, formed by the temporary union of powers
mutually jealous of each other, and oppofite in interefts. Lewis became a party in the league through the influence of cardinal d'Amboife. He even marched at the head of his army, and, in May 1509, gained a complete victory at Aignadel, which reduced the republic of Venice almoft to ruin. Its fafety arofe from that difunion which might be expected in a league formed of fuch difcordant materials. Pope Julius II. who had chiefly contributed to its formation, refolved, after the purpofes of his own ambition were anfwered, to employ all his efforts to expel the foreign powers from Italy. With this view he made peace with the Venetians, and openly declared war againft the French. A new league was now formed, of which Julius was the chief mover: he attacked in perfon the duke of Ferrara, its ally, and excommunicated the council of Pifa, which had been affembled under the aufpices of Lewis and the emperor. The military reputation of the French was ably fupported by the duke of Nemours, who, in 1512 , gained the battle of Ravenna, but fell in a rafh purfuit of the enemy. The king, his uncle, was deeply affected by the lofs of him, and of many other brave men; and deprecated a victory purchafed fo dearly. In a fhort time after this, the Swifs overran the Milanefe, and the French were expelled. It was again recovered, and again loft. At this period Henry VIII. of England joired the papal league, invaded Picardy, and routed the French in an action, fince denominated the battle of the Spurs. Henry purfued his career of fuccefs, which was interrupted by the retreat of the Swifs and the defertion of his allies; he determined, therefore, to repafs the feas with the greater part of his army, ill compenfated for the expence with which it had been attended. In 1514 the queen died, and he propofed marriage to Mary, fifter of Henry VIII. : his offers were accepted, and a league offenfive and defenfive was formed between the two kings. Lewis, however, was obliged to purchafe this alliance with a great fum of money, inltead of receiving a portion with his wife. It was agreed that Henry hould receive the payment of a million of crowns, being the arrears due by treaty to his father and himfelf; and that the princefs Mary fhould bring four hundred thoufand crowns as her portion, and enjoy as large a jointure as any queen of France. Lewis alfo agreed that Tournay fhould remain in the hands of the Eniglifh; and that Richard de la Pole, an exile in France, who affected to revive the pretenfions of the houfe of York, fhould be banifhed.

The new queen, being young and beautiful, was welcomed with univerfal acclamations by the people; who rejoiced in an alliance that converted a formidable enemy into an important friend. In the midft of feftivities given on account of the marriage, formidable preparations were made for renewing the war in Italy; but his defigns were broken. He had often repeated the adage, that " love is the king of youth, but the tyrant of old age," and he was now condemned to experience its truth. His conftitution, already fhaken, was exhaufted by his affection for Mary, with whofe beauty, grace, and numerous accomplifhments he was enchanted. He died within three months of his marriage by a diforder of debility, in the feventeenth year of his reign, and the fifty-fourth of his age. The character of this prince was diftinguifhed by a fuperior integrity, feldom to be difcerned in princes; and though fometimes the dupe of his goodnefs of heart, and often of the treachery of his neighbours, yet he well deferved the appellation of "the father of his people." In him expired the elder branch of the houfe of Orleans, and the ficeptre of France was transferred to that of Angoulefme.

## L E W IS.

"Hillory," fays the biographer, " has taken pleafure in recording, that when, according to the ufual cuftom, the criers announced his death, it was done in thefe words," the good king Lewis, the father of his people, is dead." He was naturally inclined to economy: this was onee made a topic of ridicule in his prefence, to which he replied, "I had rather fee my courtiers laugh at my avarice, than my people weep at my extravagance." In his manners and converfation, Lewis was affable, mild, and cheerful, prone to fallics of innocent pleafantry, and fond of literature. He affembled men of learning at his court, and employed them in public affairs. Greek was firtt taught at the French univerfities in his reign.

Lewis XIII., fon of Henry IV., 'by Mary de Medicis, fuccecded to the throne in 1610, under the regency of his mother, being only in the thirteenth year of his age. He was declared in his majority in the year 1614, and foon after the ftates-general were convoked. At the meetings of this aflembly many abules were difcuffed, and fome few were remedied. During the minority of the king, France had been, on account of the mal-adminitration of the queen, a feene of faction and civil commotions: thefe troubles continued, and were greatly aggravated by a religious war. Lewis's character, as it opened, difplayed that propenfity to be governed, which indicates weaknefs of mind, together with much coldnefs and indifference. The great duke of Sully, inflexible in his plans, confiding in the integrity of his own heart, and difdaining the arts of courts, found that fincerity, which had been efteemed by Henry, no longer acceptable; he indignantly retired to the eftates which he had purchafed through the bounty of the late king, and refigned his offices. Every day now revealed the afcendency of Concini, who endeavoured to remove from the eyes of the people the unpopular circumitance of foreign birth, by affuming the title of marquis d'Ancre. During the adminiltration of this favourite, the annals of France, as they refpect the internal affairs of the country, prefent a dreary profpect of uninterefting anarchy and barren difcord. The princes of the blood, infatiate of power, and the nobles turbulent and difcontented, repeatedly erected the ftandard of revolt againft the regal authority; as frequently, with contemptible levity, they courted the returning friendflip of the crown, whofe timid counfels were content to foothe, without prefuming to reprefs, their capricious arrogance. Amidlt thefe hoftilities at home the king concluded his marriage, and received at Bourdeaux the hand of Anne, the infanta of Spain. Immediately after the celebration of that ceremony, Lewis marched at the head of his army with the view of reducing the prince of Condè, in order that he might imprefs his fubjects with favourable fentiments of his courage and activity. The approach of winter fufpended the operations of the contending parties, who, while they rejected all terms of accommodation, feemed ftudious, in every enterprize, to avoid the effufion of blood. With the return of fpring the royal forces were again affembled, and were again led on by the prefence of their fovereign; but much was the furprize of his fubjects to learn the intelligence that the king had fubfribed a peace, and fubmitted to the demands of thofe princes whom he had fo lately declared traitors to his throne. In 1617, Concini was murdered in the Louvre, at the inftigation of Luynes, whom he bad introduced to the king, and whe now fuperfeded him in the royal favour. The principal events which occurred in this reign during the adminiftration of Luynes, were quarrels with the queenmother, and a renewed war with the Calvinitts, who were headed by the duke de Rohan. During this war Luynes died, and the Calvinifts obtained an advantageous peace.

In 1624, cardinal Richelieu, who, while bifhop of Luçon, had been gradually rifing to political reputation, acquired the chicf management of affairs, which he held with unco:strouled fway fo long as he lived. This great minifter found a very difficult takk before him, owing to the weaknefs of the king, the felfifh ambition of the nobles, and the prevalence of dafferent factions. War broke out again with the Calvinifts, who complained that the conditions of a former treaty had not been obferved. The fovereign appeared in arms, but the chief honour was due to Richelieu, who, after a long fiege, took Rochelle, by means of a vaft dyke throwa acrofs the harbour to cut off fupplies by fea. This important conquelt was the means of reducing the party to civil obedience, and, to the honour of the victor, they were ttill allowed a good fhare of religious liberty. In addition to the civil contentions, a war with Spain broke out in 1635, which was at firt unfuccefsful on the part of France; but at length the Spaniards were reduced to fue for peace. Inz the mean time the fpirit of Richelieu's domeltic adminiliration was highly arbitrary, and the king difplayed great harfhnefs in his addreffes to the parliament. The laft of his favourites was Cinqmars, who was recommended to the monarch by his miniter, but who was led by his ambition to cabal againlt his friend and patron. His ruin was the confequence, and Lewis gave him up to execution with the moft perfect indifference. (See Cinquars.) On the morn. ing of the execution of this man, intelligence was brought of the furrender of Perpignan, and the total difcomfiture of the enemy, of which facts the minilter apprifed the king in a fingle and very fhort fentence, "Your troops are in Perpignan, and your enemies in their graves." Immediately after thefe events, Mary de Medicis clofed a wretched life, reduced to the utmoft indigence, at Cologne. The filial affection which Lewis denied to her while living, was revived on the news of her death; but the attention of France was now completely engrofled by the approaching difiolution of him, whofe daring counfels had driven her into banifhment. The glories and life of Richelieu drew near their end; after the reduction of Perpignan, exhautted in body, but ftill vigorous in mind, he had approached the capital by flow and triumphant journies; his laft moments attefted his afcendancy over the fovereign. On bis deathbed he protefted to Lewis, that his counfels had ever heen directed to the honour of the crown and the welfare of the kingdom. (See Ricueliev.) From the death of this minitter, Lewis afpired to hold the reins of government for himfelf: the war was profecuted with diligence, vigour, and fuccefs, and the fpirit of Richelieu feemed ftill to impel the machine which his genius had fet in motion. But victory could not check the progrefs of difeafe, and Lewis was fenfible that the inevitable moment was rapidly approaching when his life and reign muft terminate together. A flow fever had already worm him to a ikeleton, and he prepared to meet with firmnefs and compoiure the laft fcene of human greatnefs. "When," fays the hiltorian, "his phyfician, at his earnelt defire, numbered the fleeting minutes that remained, and pronounced that his life could not exceed two or three hours; he received the intelligence with refignation, and even fatisfaction; and looking fervently up to heaven, added, "Well! I confent with all my heart." The prediction was ftrictly verified by the event, and he ex. pired in the forty-fecond year of his age, and in the thirty-third of his reign. In ellimating his character; he was devout, but his devotion hewed itfelf in minute obfervances and fubmiffion to his confeffors. He was not greatly addicted to pleafure, and the miltreffes on whom he beiloned his farvurs, were rather the objects of his jealouly
than of his love. He had a fhare of judgment and folid fenfe, and did not want decifion. In the adminitration of jultiee, he was inclined to rigour, and thence acquired the epithet of "The Juft;" though it muft be admitted that his adminittration of juftice was frequently impeached by his feverity, and fometimes by his cruclty.

Lewis XIV., fon of the preceding, was born in 1638 , and fucceeded to the crown, under the regency of his mother, Anne of Auftria, on the death of his father in 1643. She foon refigned herfelf to the influence of cardinal Mazarin, who had fucceeded Richelieu in the laft reign. In the early part of this reign, the kingdom was involved in a bloody and extenfive war with the houfe of Auftria. The peace of Munfter, in 1648, relieved France from the greater of her foreign foes; but it was foon fucceeded by the civil war of the Fronde, during which the royal family was obliged to leave the capital, and wander as fugitives from province to province. The education of the young king was much neglected, and he was left ignorant of the points of knowledge moft ufeful and reputable to a prince. The more valuable part of his reading was the tragedies of Corneille, which improved his tafte, and gave him ideas of true grandeur; but the want of folid inftruction moral and literary, marked his character through life. The leffon moft ftrongly impreffed on his mind in his very childhood, was the fentiment of his own importance, which, though it led him to adopt a dignified propriety of conduct, nourifhed in him that pride and vanity, and that impatience of controul, which were the leading features of his reign. Taught by flatterers that he himfelf was every thing, and that his fubjeets were nothing in the comparion; he was habituated to think no facrifice of their's too great for the promotion of his glory and the gratification of his defires. The convulfions of the ftate had not ceafed when Lewis XIV. had attained the age fixed for his affuming the reins of government, and his majority was folemnly dechared in parliament; but he was ftill in leading-ftrings, influenced wholly by the counfels of his mother, and he feemed to inherit her fond partiality for Mazarin, though he was fhortly after, by the infligation of his parliament, obliged to give him up, and fuffer him to retire into exile. No fooner was it known that Mazarin had left the city of Paris, than the king was welcomed by the inhabitants with the loudeft acclamations, and he found himfelf freed from the clamorous importunitics of a difcontented parliament, and firmly fixed on his throne. Scarcely, however, was he expelled by the general voice of the nation, and by the royal declaration, than he was recalled by the king, and, to his own infinite furprize, entered Paris once more in full power, and without the lealt difturbance. The king received him as a father, and the people as a matter; but the cardinal, amidat the fatisfaction of this change, could not reprefs his contempt of the national levity. The minifter applied himfelf with vigour to extinguinh the fparks of revolt; and, in 1653, the war of the Fronde was terminated with his complete triumph. Condè, who had joined the Spaniards, continued to maintain a kind of civil war on the frontiers, where he was held in check by his rival in glory, the great marfhal Turenne. In 1659, the peace of the Pyrences advantageounly concluded the long quarrel with Spain. One of its conditions was the marriage of the king with the infanta Maria Therefa, which took place in 1660 . The king, during the life of Mazarin, interfered very little in public affairs; but after his death, in 1661, Lewis began to govern for himfelf, and from that moment the poft of prime minitter became vacant: he had, however, able men about him ; among the $[$ e was Colbert, who had been recommended to him by

Mazarin, as a moft able financier. To his genius was owing the revival of commerce and the marine, and all the fplendid eftablifhments of arts and manufactures which adorned the carly part of this reign. It was he who, though not learned himfelf, was capable of appretiating the true value of literature, and fuggefted to the king, his mafter, that plan of penfioning all the eminent men of letters throughout Europe, which, at a comparatively fmall expence, fecured to him more adulation from perfons of real learning, than any prince of modern times. His leading object was perfonal grandeur. In whatever point any other prince had attained to greatnefs, he was refolved to emulate him. He employed all the refources of a rich and flourifing country to furpafs every competitor, in whatever could conduce to his glory. This fpirit led him to attempt many great and ufeful projects, but for want of limit and moderation, it defeated its own purpofes, and exhaufted its means before it had attained its end. The age of Lewis XIV. was that in which the reputation of France for arms, arts, literature, and magnificence, ftood at its higheft pitch; at the fame time, it was that which demonftrated its wretchednefs and humiliation, and the impartial hiftorian has held up the king rather as the fquanderer of his country's profperity, than as the author of it. Of the wars of this monarch we cannot pretend to give a detailed account; the moft that this article will allow will be a fketch of the principal events of the reign, as connected with the perfonal character of the king. A quarrel concerning the precedence between the French and Spanifh ambaffadors at London, gave occafion to Lewis to affert in fuch high terms the fuperiority of his crown, that the point was never after contelted. Shortly after, the infolence of the French ambaffador's fervants at Rome, having brought upon them an attack from the pope's Corfican guard, in which fome were killed, and the French quarters violated, the king feized upon Avignon, and obliged the pope's nephew, a cardinal, to come to Paris and afk pardon; the Corfican guard was broke, and a column was erected in Rome as a memorial of the event. War with Spain was renewed in $166 \%$; the king in perfon took the field, though the meafures of the campaign were probably directed entirely by the great Turenne. The whole of Flanders was reduced in this campaign, and at the clofe of it Franche Comptè was conquered. A triple alliance between England, Holland, and Sweden, checked the progrefs of the French arms; and produced the peace of Aix-la-Chapelle in 1668. In 1672 Lewis, with a vaft army, commanded by the ableft generals, burf upon the provinces of Holland ; and Amfterdam, the capital, was refcued from his grafp only by laying the furrounding country under water. At this juncture, William, prince of Orange, raifed to the office of itadtholder, revived the drooping fpirits of his countrymen; and the principal potentates of Europe, alarmed at the fuccefs and ambition of France, leagued againft her. Holland was now evacuated as fait as it had been over-run. The French arms were again turned upon Franche Comptè; it was conquered a fecondtime, and became infeparably annesed to the crown of France. War with Spain, the empire, and other powers, continued fome years longer, but it was terminated, in 1678 , by the peace of Nimeguen. Lewis, attended by all the pomp and luxury of a court, formed feveral fieges in perfon; he carried with him hittoriographers to record his exploits, and every art was employed to exalt him in his own eftimation, and in the eyes of Europe. He received from his fubjects the title of "Le Grand," which for a confiderable time feemed durably attached to his name; but he lived to lofe it in the eftimation of foreigners, and it has, by the events of the laft twenty years, finally become obfolete among his own
countrymen.

## L E WIS.

countrymen. 'The peace of Ninegucn did not terminate the projects of Lewis XIV.; he attacked, and brought to fubmilfion, the piratical fates of Algiers, Tripoly, and T'unis; and next, upon very trifing grounds of offence, made war upon Genoa, and forced the doge to come in perfon and akk pardon of the king. With pope Innocent XI, he quarrelled refpecting the fuppofed ri, hhts of the Roman church, and becaufe he inlifted upon retzining the franchifes of embalfadors from Rome, which other powers had agreed to renounce, as inconfiftent with a fafe and regular police. On this occafion Lewis declared to the nuncio, "that he would never take the example of others as the rule of his conduct, but that it was for him to give the example." He was now ambitious of the fame that would attach to the extirpation of herefy from his kingdom. Calvinifm, in France, fince the rictory over it by Richelieu, had become a peaceful feparation from the national church, and its fectaries were ufeful citizens chiefly attached to manufactures and commerce. Lewis, animated by a fpirit of intolerance and birotry, undertook to put an end to it. The privileges of the Proteftants were openly violated: miffionaries were fent for their converfion, fupported by dragoons; and feverities were exercifed, which excited the horror and indignation of all the reformed Itates of Europe. In 168 ; the revocation of the ediet of Nantes, firlt granted by Henry IV. and confirmed by Lewis XIII. deprived the Proteltants of all exercife of their religion, and tore from them their children to be educated Catholics. The tyrant at the fame time iffued his decrees againft emigration, asd placed guards on his coaft ; neverthelefs valt numbers efcaped from his machinations, and carried their arts and induftry to foreign and hoftile nations. Lewis, though a pretended votary to religion, and a zealous fon of the church, was not free from that licentioufnefs which is regarded as highly culpable by perfons of real and unaffected piety. Several miltreffes, in fucceffion, enjoyed his favours; with one of whom, madame de Montefpan, a married woman, he lived a long time, in the moit open manner, and indulging her haughty and capricious humour. Her influence declined with her perfenal charms, and the king's advancing years; and the was fuperfeded by the widow Scarron, elevated from that low condition to the title of madame de Maintenon, a perfon who, by the powers of her underftanding, and confummate fkill in the art of pleafing, obtained a complete afcendency over the king's mind. On the death of the queen he privately married her, but fhe was never acknowledged as queen. The league of Auxbourg, formed in 1687, bet ween the emperor and moit of the German princes, the king of Spain, the United Provinces, the duke of Savoy, and other Italian potentates, had for its object the reduction of the power of France. The great leader in this league was William, prince of Orange, who, when he afcended the throne of England, contrived to add that kingdom to the confederacy. The forces of France had proved victorious in many quarters; marfhal Luxembourg, and other eminent generals, renewed the fucceffes of the former war, and the king in perfon took Namur. The defeat at La Hogue was, however, a fatal blow to the French marine ; the finances of the country began to be depreffed, a circumitance that led to much domeftic diftrefs, and Lewis XIV. was obliged, in the midtt of victory, to fign the general peace of Ryfwick in 1697. The declining health of Charles II. king of Spain, who was without hcirs, became a fubject of univerfal intereft with refpect to the difpofal of his vaft inheritance ; and Lewis, fearing left it fhould fall into the hands of the houfe of Auftria, joined England and Holland in a fcheme for the partition of the Spanifh dominions. At length, however, the dying king
made his will, appointing, as his general heir, Philip, duke of Anjou, fecond grandfon of Lewis. The wary monarch forefaw the danger of accepting the legacy, but was decided by a regard for the glory of his houfe, and the wifh of uniting the interefts of two great monarchies, which had generally been at variance. The hopes of the king have been completely difappointed, and every attempt to form an union of iuterelt and affection between two nations radically oppofite in character and circumilances, has teen bafled. Neither the intrigues nor the power of the prefent emperor of France have, at prefent, been able to effect that which was unqueftionably an objeet near the heart of Lewis XIV.
The jealoufy excited in England and Holland by this acceffion to the influence of France, was converted into open hoftilty by the imprudence of Lewis in declaring the fon of James II., king of England, at the deceafe of his father in 1701. This ftep, contrary to the unanimous advice of his council, and his own judgment, was taken in confequence of a generous emotion of pity for the family of his royal friend, enforced by the folicitations of madame de Maintenon; it was not only impolitic, but, in fact, it amounted to a declaration of war, becaufe an article in the peace of Ryfwick, explicitly acknowledges William's title to the crown of England. A new league was immediately formed between the maritime powers and the emperor of France; and the death of king William, during the preparations for war, did not prevent its being carried into execution under his fucceffor queen Anne. From this period to the year 1711 , the reign of Lewis was one continued feries of defeats and calamities; and he had the mortification of feeing thofe places taken from him, which, in the former part of his reign, had been acquired at the expence of many thoufand lives. The domettic mifery of Lewis had kept pace with the public calamities ; the court, the fplendour and magnificent entertainments of which had excited the admiration and envy of Europe, had long been impreffed with a deep and fettled gloom. The art of furgery, in Europe, was jet feeble and crude; a fiftula, with which the king was attacked, fpread a general alarm; and though the operation was fuccefffully performed, yet he never recovered his accuftomed \{pirits, but led a more ferious and retired life, and chiefly devoted his hours to the converfation of madame de Maintenon, whofe influence increafed with his years. To his own private afflictions were added many family loffes. The death of the king's only fon, which happened in 1712 ; the duke of Burgundy, the duchefs his wife, and their eldeft fon, all fwept away within a few months, and laid in the fame tomb; the only furviving child at the point of death; thefe private woes, added to thofe of the public, mark the clofe of the reign of Lewis, as an era of calamity; and a wretched people, who conceived that their own happinefs was concerned in the glory of the king, awaited in filence to behold the former greatnefs of their monarch extinguifhed by the dark cloud of mifery which obfcured his fetting fun. Another mortification remained for the king; he had enlarged the canal of Mardyke, and formed an harbour there, equal, it was thought, to that of Dunkirk. The embaffador for England remonftrated againft this evafion of the treaty of Utrecht, and Lewis was under the neceffity of difcontinuing the works. At the age of feventy-feven, that vanity and ambition which had agitated the years of manhood were nearly extinguifhed. He coolly liftened to the folicitations of the unfortunate James, who afpired to afcend the throne of his late filter, queen Anne, already filled by the elector of Hanover, under the title of George I. To the importunities of the prince he granted a fmall fupply of money, and a veffel fitted out in the name of an individual; but while

## L E WIS.

that enterprize hung in fufpence, Lewis was feized with a mortal difeafe which foon brought him to the grave. In his lat hours he difplayed a greatnefs of mind worthy of his exalted fituation. "Why do you weep," faid he to one of his domeftics, "did you think me immortal ?" His fortitude was tempered with humility; he recollected his own weaknefles, and had fufficient magnanimity to confefs them; his advice to the infant that was to fuceced him was to avoid that glory which he had hoped to attain by war, and to confider the happinefs of the people as the principal object of his government. To madame de Maintenon he left no tixed Itipend, but contented himfelf with recommending her to the care of the duke of Orleans. She retired to St. Cyr, which had been founded, at her perfuafion, for the education of young ladies, and demanded but little more than 3000 . per cinnum during her life; this was regularly paid till her death, which happened in about four years. Lewis XIV, had the misfortuna of outliving his popularity, and an indecent joy was manifefted by the people at his funeral. As a monarch he had none of the commanding qualities which create a natien or an era, and would fcarcely have been diftinguifled from common princes under common circumftances. The mafculine beauty of his perfon was enbellifhed with a noble air; the dignity of his behaviour was tempered with the higheft affability and politenefs; elegant without effeminacy ; addieted to pleafure without neglecting bufinefs; decent in his vices, and beloved though invetted with arbitrary power. Neverthelefs his qualities feemed thofe that rather attract a momentary regard, than command a permanent efteem. Thie talents, the fire of the ftatefman, and the hero were ftill wanting; vanity rather prompted him to infult, than ambition to enflave his neighbours. Though he frequently took the field, and reduced countries and the ftrongeft towns, yet in all his campaigns he never expofed his life to the hazard of à battle. The age of Lewis XIV. will always be a memorable period in his country and of Europe. His own intellectual acquifitions were very limited, but he was the patron of learning and fcience.

Lewis XV., fon of the duke of Burgundy, (grandfon of Lewis XIV.) was born at Verfailles in 1710 , and fucceeded to the crown on the death of his great grandfather, when he was but five years of age. By the laft will of Lewis XIV., a council of regency was appointed during the minority of the young king, at the head of which was the duke of Orleans. That nobleman, however, difgulted with an appointment which gave him only a calting vote, appealed to the parliament of Paris, who fet afide the will of the late king, and declared the duke fule regent. His firlt acts were extremely popular, and gave the molt favourable ideas of his government and character. He reftbred to the parliament the right which had been taken from them, of remonftrating againt the ediets of the crown; and compelled thofe, who had enriched themfelves during the calamities of the former reign, to reftore their wealth. The young king was placed under the tutelage of Fleury, bifhop of Erejus, afterwards cardinal, who, by his infinuating and very gentle manners, acquired his affection and efteem. His minority ended in 1722, and he was folemnly crowned; but the regent retained his chief power during another year. He now refigned his high office as prime minifter to the duke of Bourbon, who negociated a marriage between the king and Maria Leczinfki, daughter of Stanillaus, king of Poland, which took place in 1725. Shortly after this, Fleury became prime miniter; which polt, notwithflanding his great age, he held till his death in $17+3$. The fpirit of his government was econumical and pactic; and a war with the empire, in 1733, was the principal foreign occurrence.

This terminated in the annexation of Lorraine and Bar to the crown of France. Lewis lived for fome years in conjugal affection and fidelity with his queen, by whom he had one fon and feveral daughters. At length, however, he was captivated by the allurements of fome ladies of the court, and receired, it is faid, the favours of three fifters at the fame period: and from this time he indulged his propenfities for the female fex without moderation and delicacy. On the death of the eniperor Charles VI. in 1740, a new continental war was excitcd. France joined with Pruffia and Poland, in raifing to the empire the elector of Bavaria, in oppofition to the interelts of the houte of Aufria, whofe caufe was maintained by England, Holland, and Sardinia. In 1744 Lewis took the ficld in perfon, and was at the reduction of feveral ftrong places; but at Metz he was attacked with a dangerous illnefs, which occafioned a general contternation through France. His recovery was celcbrated with all thofe tranlports of joy which could proceed from the awakened fenfibility of a nation, then renarkable for an enthufiaftic attachment to its fovereigns. The furname of "Well-bcloved" was given to the king on this occafion ; and, in return for the affection of his people, he difplayed the feelings of a good heart, and exclaimed very fincerely, as well as very naturally, "How fweet is it to be thus loved I What have I done to deferve it?" Soon after his recovery, he beheld at a diftance the bloody battle of Fontenoy, gained by marfhal Saxe. The French were generally fuccessful in Auftria and the Dutch Netherlands, but were defeated in Italy; and their marine was totally ruined by the Englifh. The treaty of Aix-la-Chapelle, in 1748, reftored peace to Europe: and, as far as the exhaufted finances of France would allow, ufeful plans of domeftic improvement were executed; and the moft fplendid eftablifhment of the reign, the royal military fchool, was inftituted in the year 175 I . About this time, fome warmly contefted difputes between the magiftracy and clergy occafioned the interference of the king, who, inftead of making a firm decifion between the contending parties, upon principles of juftice and true policy, acted the part of a defpot, by alternately banihing both. It was in confequence of the ferment produced by thefe quarrels, that a fanatic, named Damien, was induced, in 1757 , to attempt the life of the king at Verfailles, in the midit of his guand. He received a flight ftab between his ribs. Damien was evidently infane : he was inftantly feized by the foldiery, and put to the rack, in which he endured the molt exquifite tortures that the wit of the moft favage hearts could invent. In the midat of thefe he perfifited in an obftinate manner to declare, that he had no intention to take away the life of the king: his only object was to wound him, that Almighty God might by that means affect his heart, and thereby incline him to reftore peace to his dominions. Thefe expreffions had no weight with his mercilefs tormentors, who configned him to the moft terrible death which they could devife. This circumftance had probably fome effect on the king himfelf; for he foon after banihed the archbifhop of Paris, and accommodated matters with his parliament. The war of 1755 had brought the nation to the brink of ruin, when Lewis implored the affiftance of Spain; and on this occafion the celebrated "Family Compact" was figned, by which, with the fingle exception of the American trade, the fubjects of France and Spain were naturalized in both countries, and the enemy of one fovereign was to be in: variably regarded as the enemy of the other. At shat time, the acceffion of Spain to her caufe only added new laurels and acquifitions to Great Britain. Lewis's attachment to a feltinh and imperious miltrefs, madame de Pompadour, who

## L E WIS.

was allowed to appoint and difmifs minifters and commanders at het pleafure, and facrificed every thing to her avarice and ambition, was greatly inftrumental in producing the difafters which followed one another at this period in rapid fucceffion. The conclufion of the feven years' war, in 1763 , gave the nation repofe, but not without a confiderable diminution of territory; and in the following year, the fociety of Jefuits, as celebrated for their great learning as famous for their unbounded intrigues, was abolifhed in France. The death of madame de Yompadour did not free the king from female influence, who by this time had incurred all the habits of a confirmed debauchee. He fell under the dominion of madame de Barre, who, by her diffolute arts, provoked his languifhing delires; and his latter years, as might have been anticipated by the conduct of the former part of his life, was difgraced by the grofeft fonfuality. At the fame time, the government became more fevere and arbitrary. Though the arms of Lewis had extinguifhed the flame of freedom in Corfica, in France it was revived by the breath of the parliaments, and cherifhed with a fond regard that threatened the moit important confequences. An edict iffued by the king, which transferred fome nerr and extraordinary powers to the grand council, was ftrenuoufly oppofed by the parliament of Paris. Sixty-four members of that affembly voted for utterly abolifhing that council; and the queltion was loft by a majority of two, though all the princes of the blood attended to fupport the court ; and the duke de Choifeul endeavoured to overawe the independent fpirit of the patriotic party, by continuing in the affembly throughout the debate. The minitter, finding his exertions in the fupport of defpotifm of no avail, attempted to conciliate thofe whom he had vainly endeavoured to intimidate. Hitherto the fovereign had refifted the folicitation of the people to reltore the parliament of Brittany: he now afpired to popularity, by doing of his own accord that which he had been frequently importuned to grant; and the duke de Duras was fent into that province to re-eftablinh the parliament, and to recal the members from exile. But conceffion, which a fhort time before would have been afcribed to the benignity of the monarch, was now attributed to his fears; and the parliament had fearcely affembled before they convinced their countrymen, that oppreffion had confirmed, and not extinguifhed their zeal for the public welfare. The province of Brittany had long groaned under the iran rule of the duke d'Aiguillon; who for four years had perfecuted with unremitting vengeance M. de Chalotais, the attor-ney-general to the parliament. That unfortupate gentleman had oppofed, with the indignation of a virtuous magiltrate, the oppreffive meafures of the duke; he was therefore driven into exile, and purfued from dungeon to dungeon, till at length a fentence was procured againft him that would have invotved his life, and which his cruel perfecutor was hattening privately to carry into execution. The parliament of Brittany interfered, and prevented the perpetration of fo foul a deed. The refcue of M. de Chalotais laid open a fcene of the blackeft iniquity; and the parliament of the province, poffeffed of new proofs, commenced a procefs againtt the duke d'Aiguillon, whofe trial was conducted in the prefence of the king, the princes of the blood, the peers, and the parliament of Paris. Before fo high a court thus fpecially affembled, the written proceedings carried on againit M. de Chalotais were produced, and difclofed fuch a complicated fystem of guilt and cruelty as exceeded every thing that could have been imagined. Amidtt thefe domeftic difquietudes, the dauphin, afterwards Lewis XVI., received the hand of Maria Antoniette, fifter to the emperor of Germany. The crowd that eagerly preffed forward
to be fpectators of the firesworks, difplayed on this occafion, was fo great, and the confufion that prevailed was fo completcly overwhelming, that feveral hundred perfons perifhed, by being literally trampled to death. This lofs, however, which was felt in one way or other by almoft all the families of Paris, did not divert the public attention from the profecution of the duke d'Aiguillon. But at the moment that the nation was expecting, with the mof earneft folicitude, the decifion of this mof important caufe, Lewis thought proper, by a violent exertion of his power, to put a flop to the whole courfe of juftice, and to all farther inquiries into the conduct of the duke. All the parliaments of the kingdom made a common caufe : the ordinary courfe of juftice was furpended; and, in conclufion, the king, in 1771, overthrew the whole fytem of judicial adminiftration, and eftablifhed a new one. This was not effected but with force. The language of the parliament of Paris was worthy the indignant feelings of free men: "Your edict, fire," fay" they, "is deffructive of all law: your parliament is fworn to maintain the law; and the law perihing, they fhould perih with it : thefe, fire, are the laft words of your parliament." Lewis, unaccuftomed to fuch language, prepared to fupport his authority by the moft violent meafures. In the dead of the night, the members were roufed from their flumbers by parties of the guards fent into each houfe, who prefented to every individual a lettre de cachet, which enjoined them to declare whether they would refume the adminiftration of juftice. In the moment of confufion, feveral of them were furprifed into acquiefcence; yet they foon retracted, and, in the end, the whole body of parliament was banifhed the capital. Here then was the foundation of that revolution, which mult be touched upon in the next reign, and which has introduced fuch fcenes into the political world which the wildeft imagination could not have conceived. The exhaulted ftate of the finances fuggefted new and burdenfome impolts on the great body of the people, which augmented the public difcontents. In the midt of thefe, Lewis found no folace even in the company of his mittrefs madame de Barrè: her beauty proved infufficient to excite defire; and he became difcontented with himfelf, and with all about him. A fucceffion of miftreffes became neceffary to roufe the languid appetites of the king. One of thefe, who was infected with the fmall-pox, communicated the difeafe to the king, who in a fhort time died of it, unpitied and unlamented, May 1774, in the fixtieth year of his reign. He had loft his only fon in $1 ; 65$, and his crown devolved upor his grandfon.
Such was the fate of Lewis XV., who at lengtts fell a victim to thofe fenfual appetites, in the gratification of which he had facrificed his own fame, and the welfare of his fubjects. The enviable appellation of ruell-bcloved, which he was confcious, as we have feen, he had not merited, bat which had been conferred in the moment of danger by a loyal and affectionate people, was completely obliterated from memory, by 30 years of lafcivious excefs, profufion, and rapacity: his example had loofened the bands of morality; his prodigality had exhaufted the credit and refources of his country; and his wanton pride had trampled upon every form that had been held facred in the conttitution. His affections feemed to have been confined within the narrow limits of his perfonal pleafures and fecurity. It was by the perpetual fuggeftions of the countefs de Barre, that his fafety was at itake, which ftimulated him to decifive meafures in fupprefing the parliaments of France. Though concealed from the public eye, the embers of freedom were ftill carefully cherifhed, and, as will be feen in due time, burf forth with accumulated force, and overwhelared

## I E WIS.

wheimed the throne of defpotifm. During this reign the arts and fciences made a rapid progrefs in France, which was aided by the munificence of the court, as long as other demands did not anticipate the funds for this purpofe. The voyages of the French mathematicians to the equatorial and polar regions, iu order to meafure a degree of the meridian, were equally honourable to the government and the perfons employed. The king was decply read in hiftory and geography. As a gentleman he was polite, affable, and naturally mild and humane ; but fondnefs for fenfual indulgence degraded him as a king and a man.

Lemis XVI. grandfon of the preceding, and fon of the dauphin, Lewis, and of Maria Jofepha of Saxony, was born in Augult, $175+$. His father carefully fuperintended the education of his three fons, and placed them under the direction of preceptors, who were particularly attentive to their morals, and who inftilled into their minds found prineiples. With refpect to the fubject of the prefent article their cares perfectly fucceeded t he, whofe title at that time was the duke of Berry, was naturaily modelt, timid, and docile, and repaid, by his virtues, the attention beftowed upon him. In his earlieft years, though he did not manifelt any brilliancy of parts, he fhewed a difpofition capable of attaining ufeful knowledge, and manifefted a memory retentive of the minutelt facts. He had a found judgment, great patience and application. He afcended the throne in $\mathbf{1 7 7 4}$, being then in the 20th year of his age, and, to fecure himfelf againtt the dire effects of that difeafe, which had proved fatal to his predeceffor, fubmitted to inoculation, with fereral others of the royal family. Their quick and eafy recovery contributed much to extend the practice throughout the kingdom. The king, as foon as he had gained his health, applied himfelf diligently to extinguifh the differences which had taken place betwixt his predeceffor and the people. He removed thofe from their employments, who had given caufe of complaint by their oppreftions; and he conciliated the affections of his fubjects, by difmiffing the now parliaments and recalling the old ones. Though the prudence of Lewis had fuggetted thefe compliances, he was anxious to preferve the royal authority pure and entire: he avowed in one of his earlieft fpeeches, in the great chamber of parliament, that the fteps he had taken were defigned to enfure the tranquillity and happinefs of his fubjects; and he hoped, from the zeal and attachment of the prefent affembly, for an example of fubmiffion to the reft of his fubjects; he farther faid, he was defirous of burying in oblivion all paft grievances, and that he fhould ever behold with extreme difapprobation, whatever might tend to create divifions and dilturb the general tranquillity. It was, however, the misfortune of this monarch, as it was that of Charles I., to come to the crown at a period when a great change in public opinion had long been preparing, and was now arrived at a point, which announced a fpeedy crifis in the political fyftem. The defpotifm of the lalt two reigns had exafperated men's minds, and rendered them alive to the evils of arbitrary power, while the weaknefs and debauchery of Lewis XV. had accuftomed the nation to regard the crown with contempt. " The profligacy of the nobles, the rapacity of the courtiers, the difputes and vices of the clergy, had fapped the foundations of focial order; and, in the mean time, a fet of able and eloquent writers had arifen, who, by the united powers of argument and ridicule, aggravated all the faults of ancient eflablihmments, and endeavoured to fubvert .public opinion." The finances were in a flate of derangement, and though the king himfelf was extremely moderate in his expences, his economical plans were thwarted by the queen and the princes of the blood.

The final conquett of the Corficans, who, provoked by the oppreffions of their governors, had once more attempted to regain their former liberty, was the firft event of import. ance which took place after the refloration of public tranquillity; but the kingdom was a prey to diforder from other caufes. A fcarcity of corn happening to take place juft at the time that fome new regulations had been made by M. Turgot the new financier, the populace rofe in great bodies, and committed fuch enormous outrages, that a military force became abfolutely neceflary to quell them. The humanity of Lewis was fhewn in an edict, which he caufed to be regiftered in parliament, fentencing the deferters from the army, in future, to work as flaves on the public roads, inftead of punifhing them, as formerly, with death; and with equal attention to the general welfare of his fubjects, he feized the moment of peace to fulfil thofe promifes of economy, which on his acceffion he had given to the people. Particular attention was paid to the Itate of the marine; and the appointment of M. de Sartine, in 1776, to that department, did honour to the penetration of the fovereign. Shortly after this, notwithftanding the danger of the example, France took a decided part in the quarrel between England and her American colonies, permitting fome of her fubjects, men of high rank and ftation in the country, to crofs the Atlantic, and ferve in the republican armies. The confequence of thefe meafures was a declaration of war on the part of England. After a variety of fortune, France and her allies fucceeded in detaching America from the Britifh crown; yet the expence of fuch widely extended operations left the French finances in a ttate of aggravated diforder, while the event could not fail to operate in behalf of antimonarchical principles. In the mean time fucceffive miniftries had adopted various and contradictory fyftems with regard to external and internal policy; and feveral projects of reform had been propofed and difcuffed, with no other advantage than that of accultoming the nation to debate with freedom all public topics, and open its eyes to exifting abufes. Without pretending to enumerate the events of the prefent reign as they occurred, the record of which would fill a volume much larger than that of which we can only occupy a very few pages, in the defcription of an era more important to France and the world than can be found in hiftory; we fhall only refer to fome of the more prominent events, which led to the fatal, unjuft, and cruel termination of the reign and life of Lewis XVI.

Of the miniftries employad by Lewis, feveral were diftinguifhed for enlarged and philofophical views, though, as it afterwards proved, they were very little accommodated to circumftances and the ancient conftitution of the country. Among the more remarkable occurrences of the period of which we are fpeaking, was the appointment of M. Neckar to the adminitration of the fianarices of the country. Hitherto France had carefully excluded aliens from the country and eftablifhed faith from the controul of her revenue; nor was it lefs hoftile to the feelings of the court, that a perion without rank fhould be elevated to fo high an office in the ftate: neverthelefs M. Neckar was a Swils by birth; a Proteftant in religion; and a banker by profeffion. In the year 1780 , the king fixed on the anniverfary of his birth to render the day memorable in the annals of his country by a new inflance of humanity, and abolifhed for ever the favage cultom of "putting the queflion," as it was denomi. nated, that is, of extorting confeflion from perfons accufed, by the inttrumentality of the rack and other engines of tor-ture;-a cuftom which had been fo long eftablifhed by the practice of ages, that it feemed to be an infeparable pakt of the conflitution of the courts of juitice in France. At
the fame time, he rendered himfelf worthy of public efteem, by diminihing his own expenditure, and by facrificing the magnificence of his court to the eafe of his fubj: Ets. Unfortunately, however, the popular difcuntents were excited in the following year, by the difmiffion of the then popular miniter M. Neckar. He had conceived the arduous project of fupporting the war by loans without taxes; and the rigid economy which he had introduced into all the departments of the houlhold, and the various refources that prefented themfelves to his fertile genius, had fupported him amidft the difficulties that attended his fyitem. The aufterity of his manners, increafed probably by the difficulties with which he was furrounded and interrupted, rendered him exceedingly obnoxious to the queen and perfons about the court, who took every opportunity of reprefenting the reforms, which he had introduced, as inconfiftent with the dignity of the crown: he was therefore difmiffed from the high office, which he had held with great repusation. The effect of his difniffal was a vaft abatement of public confidence in the permanency of the flate; three different perfons fucceeded one another in rapid fucceffion, as finance minifters; thefe, however, whatever might be their intentions, ferved only to increafe the jealoufy of the people, and the failure of the celebrated "Caiffe d'Efcompte" completed the univerfal confternation. The ftoppage of this national bank was imputed to a fcarcity of fpecie, but the real caufe was probably owing to an inmenfe loan advanced fecretly to the government. Some fuccefsful expedients revived the credit of the bank, and its fock role to above double the original fubfrription; by thefe means public credit was reftored throughout the kingdom. In 1783 M. de Calonne, who had already fucceffively filled with acknowledged reputation the office of intendant of Mentz, and afterwards of the provinces of Flanders and Artois, was nominated to the poft of comptroller-general. This gentleman, whofe name was accidentally omitted in the alphabetical arrangement of the Cyclopedia, was born at Douay, in 1734, educated at Paris, and became an advocate of confiderable reputation. After fome attendance at the bar, he obtained, as we have feen, various important trufts, till he became prime minitter. When he fucceeded to this office, it was faid, he did not find a fingle crown in the treafury. In this important office he continued about four years, and by fome ipecious operations he reftored an apparent profperity to the affairs of the ftate, and maintained the public credit by a punctuality, till then almoft unknown, in the payments from the royal treafury. He laboured with unwearied affiduity to reftore the equipoife between the annual income and expenditure, and to provide a fupply for the emergencies of the ftate, without vaftly increafing the burdens of the people, which, even before his adminiftration, they were fcarcely able to fuftain. For this purpofe, he advifed the king, to revive the ancient ufage of convening national affemblies of the Notables, to whom he propofed the bold project of fuppreffing the pecuniary privileges and exemptions of the nobility, clergy, and magiftracy. This meafure was too daring even for him to carry; it excited indeed fo much ill-will and determined hatred from thefe powerful bodies, that M. de Calonne found it neceffary to retire to England, where he wrote two defences in juftification of himielf and his meafures. At the end of the war he returned to Paris, where he died in 1802. He was author of feveral other works, on the fituation of his country, and on the ftate of its finances.

The ftates-general of the kingdom, as a body formidable to monarchical authority, had never been convoked fince the year 1614 , aud it was therefore determined firft to have re-

Vol. XX.
courfe to an inferior kind of affembly, denominated the Notables, becaufe thefe were to be felected by the king from the different orders of the flate, and therefore it was expected they would the more readily fubmit to the guidance of the court. This affembly had been convened by Henry IV. and again by Lewis XIII. and was now to be fummoned by the authority of Lewis XVI. The writs for calling them together were dated the 29 th of December 1786 ; and they were addreffed to feven princes of the blood, nine dukes and peers of France, eight field marhails, twenty-two nobles, eight counfellors of thate, four mafters of requefts, eleven archbifhops, thirty-feven perfons high in the profeffion of the law, twelve deputies of the pays d'êtats, and twenty-five magiftrates of the different towns in the kingdom. The firt meeting of this affembly, in the month of February 1787, difclofed an enormous deficit which had hitherto been concealed. Great taxes were propofed to make good the deficiency, which the parliament of Paris refufed to regitter, and thus refufing, that body was immediately banifhed the capital. The duke of Orleans, a man who difguifed the wortt principles, and the moft criminal ambition under the mafk of patriotifm, and who probably, from this moment, was perpetually engaged in intrigues to ruin the king and fubvert the conflitution, having entered a proteft in favour of the parliament, partook of its punifhment. Various meafures, fome harfh, fome conciliatory, fucceeded, all difplaying the embarraffment of the government, and the progrefs of the public difcontents. M. de Calonne was now difmiffed; Neckar was recalled; and at length, after a third convocation of the notables to no good effect, it was refolved to adopt the alarming expedient of calling together an affembly of the ftates-general, a circumftance that was looked on with anxious dread by the partifans of the court, and which was anticipated with pleafure and delight by thofe who were hoping for fome radical change in the affairs of the ftate. On the difmiffion of the notables, they were addreffed in a moderate and very conciliatory fpeech from the throne. During the delay, the popular caufe had ftill been gaining ground in the public mind, by meetings held in the capital and provinces, at which the utmoft freedom, and no fmall portion of violence, in difcuffing political points, were indulged, and men of the inferior claffes were habituated to act in concert, and become familiar with their own ftrength.

The time appointed for the convention of the ftates-general was now approaching, and the means of affembling them formed a matter of difficult deliberation in the cabinet. The laft meeting, in 16I4, had been convened by application to the bailiwicks. This mode was liable to ftrong objections ; the bailiwicks had been increafed in number and jurifdiction, feveral provinces having, fince that period, been united to France; and the numbers and quality of the members were no lefs an object of ferious attention: it was not, therefore, till the clofe of the ycar, that the propofal of M. Neckar was adopted, which fixed the number of deputies at 1000 and upwards, and decreed that the reprefentatives of the third eftate or commons fhould equal in number thofe of the nobility and clergy united. It remained now, as a matter of valt importance, for the popular party to carry the meafure of the votes being taken, not by orders in three diftinct houfes, but by numbers in one houfe. As this would infallibly throw the whole power into the hands of the third eflate, it was long and vigoroully oppofed by the royalift and aritocratical parties. At length the commons, thinking themfelves fufficiently fupported by the voice of the people, declared themfelves "The National Affembly," and affumed the whole legiflative authority. (For an account of the great operating and immediate

## L E WIS.

caufes of the French revolution, we fhall refer to the articic Revolution, and in the prefent article confine ourfelves to thofe events which were clofely connected with the conduct of the king.) During the violent and momentous contentions which were excited in every part of the kingdom, and particularly at Paris, the king, never fteady to his purpofe, fluctuat 1 between oppofite councils. His chief defire was, evidently, to preferve tranquillity, and prevent the effufion of blood, and he was prepared on his own part to fubmit to any facrifices for this purpofe that might be required of him. The flates had been fummoned to meet at Verfailles on the $2 \eta$ th of April, and moft of the deputies arrived at that time ; but the elections for the city of Paris not being concluded, the king deferred the commencement of their feffions till the $4^{\text {th }}$ of May. During this period, the members affembled, having little to do, foent their time in forming an intimacy with each other. Some of them united themfelves into a club, into which none were admitted but thofe who were deemed zcalous advocates for the popular caufe. This fociety, originally formed at Verfailles, was, hereafter, found fufficiently powerful to give laws to France, under the appellation of the Jacobiri club, and to excite an almoft univerfal terror and alarn through Europe. The flates-general commenced their bufinefs by roing in folemn proceflion, preceded by the clergy, and followed by the king himfelf, according to ancient cuitum, to church, to perform an act of devotion. The nobles and fuperior clergy were fplendidly arrayed: the commons appeared in black. The affembly was now opened by a flort fpeecli from the throne, in which the king congratulated himfelf on thus meeting the people affembled; and having alluded to the difficult circumftances in which thoy were placed, he concluded with the followiag prayer, "May an liappy union reign in this affembly, and may this epocha become ever memorable for the glory and profperity of the country. It is the wifh of my heart ; it is the mott earneit defire of my prayers; it is the price which I expect from the fincerity of my intentions and my love for my people." Several weeks were fpent in difcuffing mere matters of form; in the meas time the people from without were vexed that no important ftep was taken to remedy the evils under which they laboured. They imputed this delay to the nobles and clergy, who became exceedingly unpopular. The leaders of the commons, called at that period the tiers etat, tonk advantage of the change which was taking place in the minds of their countrymen, and formed the project of feizing the legiflative authority of France : they almoftinftantly declared that the reprefentatives of the nobles and clergy were only the deputies of particular incorporations, whom they would permit to fit and vote among themfelves, but who had no titie in a collective capacity to act as legifators of France. Some of the clergy had joined them; and they then proceeded to announce themfelves, by a folemn decree, the fovereign legilators of their country, under the name of the "National Affembly." M. Bailly, the celebrated aftronomer, was the firft prefident : its earlieft acts were decifively expreflive of its own fovereignty. This was in the middle of June, and by the 19th a majority of the clergy voted for the verification of their powers in common with the national affembly, and they refolved to unite with them on the following day. At this important crifis the nobles perceived, that unlefs they could make a decifive ftand all would be lolt : they accordingly addreffed the king, intreating. him to diffolve the ftates-general ; and on the next day, the 20th, when the prefident and members were about to enter as ufual into their hall, they found it furrounded by a detachment of the guards, who refufed them admiffion, while the heralds at the fame time proclaimed "A royal
feffion." Alarmed and irritated by this unexpetted crent, they inftantly retired to a neighbouring tennis-court, where, in the vehemence of enthufiaim, they took a folemn oath, " never to feparate till the conftitution of their country fhould be completed." The royal feffion was held in the moft fplendid form, but altogether in the fyle of the ancient defpotifm: the fuperior orders were feated while the commons were kept an hour in the open air, while it rained, before they were admitted. The king now affumed a high tone, delivered his fpeech, ordered the deputies to retire, and then left the affembly. He was followed by the nobles and part of the clergy, but the commons and thofe attached to them remained in gloomy filence, which being interrupted by an officer of the crown, who was left to fee the intentions of his majefly carried into effect, the count de Mirabeau, flarting from his feat, indignantly exclaimed, "The commons of France have determined to debate; you, fir, who have neither feat nor voice, nor a right to open your lips here, are not to remind us of the king's intentions. Go tell your mafter, that we are here by the power of the people, and that nothing fhall expel us but the point of the bayonet." The king gave way, and at firft, anxious to fpare the blood of his people, recommended the higher orders to join the deputies of the commons ; but, in a few days, he faw, or was perfuaded by the queen and her party, that the obvious tendency of the popular meafures was the entire fubverfion of all monarchical power; he therefore gave orders for the affembling of troops round the capital, and ventured upon the ftep of difmiffing Neckar, and commanding him inftantly to quit the kingdom. Paris burf into a flame upon this unexpected event ; commotions took place; the foldiers were commanded to fupprefs the feditious affemblies; but they without hefitation grounded their arms inftead of firing on the people; a valt body of national militia was organized, who fupplied themfelves with arms from the arfenal of the invalids, and on the memorable 14 th of July, 1789, hodilities againf the royal authority openly commenced by the forming of the Baftille. Reliftance to the popular torrent was now in vain; the king recalled Neckar, who returned amidft the acclamations of the whole nation, and refumed the reins of government. Schemes for a new conititution and new meafures of finance were difcuffed with calmnefs and compofure, till a fcarcity of provifions, joining with other caufer of public agitation, infpired the populace with uncontroulable fury. In the beginning of October a dreadful infurrection took place, in which an immenfe armed mob marched to Verfailles, broke into the palace, malfacred fome of the guards, and compelled the king, with the queen and his family, to accompany them to Paris. The triumph of the popular party was followed by the emigration of fome of the moft zealous friends to royalty, who carried into foreign countries a defire of exciting thofe hoftile interferences cil the part of the neighbouring powers in the affairs of France, which in the end proved deftructive to the king and his family. On the 19th of October the national aff-mbly, which had followed the king to Paris, opened its firlt feffion; and a conflitution was Ipeedily formed on the bafis of a limited monarchy; a decree was paffed, which put an end to all diftinetion of orders and immunities, fo far as privileges were concerned, and the whole of the lands belonging to the church were confifcated for the purpofe of fupplying the exigencies of the ftate, This: meafure was propofed by M . Talleyrand, the bifhop of 'Autun, who afterwards took a ead in the revolution. A provifion was, at the fame time, made for the national clergy, who were in future to be paid by the fate On the day following that, on which this important meafure was adopted, a decree was paffed, fufpending the parliament of the kingdom.

## LEWIS.

dom from the exercife of their functions. During the winter the king had been ftrictly watched by numerous guards placed round his palace, fo that he was regarded as in a flate of captivity. To obliterate this impreflion, if poffible, he appeared in the affembly, and in the prefence of the deputies of the nation made a folemn declaration of his refolution to adhere to and defend the new conflitution to the laft moment of his life. On the $14^{\text {th }}$ of July it was determined to commemorate the deftruction of the Baftille, that fortefs of defpotifm : never was a more fplendid fpectacle. The national affembly and the coure joined in the proceffion that was made on the occafion, and when every thing was properly arranged to create effect, the king, after a ferious invocation to God, approached the altar, and amidft the moft folemn and awe-infiring filence, took the following oath: "I the king of the French do fivear to the nation, that I will employ the whole power delegated to me by the conflitutional law of the flate, to maintain the conflitution, and enforce the execution of the law." The national affembly then took oaths of fidelity to the nation : as did La Fayette and others in the name of the national guards. After this a "Te Deum' was fung, the performance of which was fublime beyond the power of defrription. " Never," fays the hiltorian, "was there before fuch an orcheftra, or fuch an audience ; their numbers baffled the eye to reckon, and their fhouts in full chorus rent the ikies. It is impoffible to enumerate all the means which were employed to add fplendour to this day. It ended with a general illumination, and no accident occurred to difturb the public tranquillity."

Several new efforts were now making by the difaffected among the nobles and clergy to excite diturbances in various parts of the kingdom. Emigration became more frequent, and comprehended the king's aunts, and moft of the princes of the blood, while troops were collected and openly formed into an army on the frontiers. The public fufpicions were naturally kept awake by thefe circumftances, and papular ferments occafionally broke out in the capital and provinces. In April, 1791, the king and his family preparing to go to St . Cloud, to fpend the Eatter holidays, were forcibly ftopped by the populace, who were fufpicious that he meant to quit the capital. La Fayette drew out the national guard, but they, with one confent, refufed to act againtt the citizens: "We know," fay they, "that we are violating the laws, but the fafety of our country is the firl law." The king went to the affembly and complained of the infult : he was anfwered refpectfully by the prefident, and continued his journey. He now endeavaured to convince foreign courts that he was no longer in a ftate of thraldom, declaring his cordial affent to the new order of things.

About this period, M. de Bouille, to whom the protection of the frontiers was entrufted, was employing every means in his power to render the country defencelefs. The garrifons were left unprovided; difunion was fpread among the national troops, who were removed from the frontiers, and their place was occupied by foreigners, wherever it could be done. The emigrants abroad, and their friends at home, were lying in wait for an opportunity of revolt ; when fuddenly, on the 2 Ift of June, it was announced from the Thuilleries, that the king, the queen, their children, together with the king's eldef brother and his wife, had quitted the palace and the capital. The national affembly took upon themfelves the government, and decreed their fittings to be permanent: they fent at the fame time meffengers in all directions to attempt to lay hold of the fugitives. At Varennes they were ftopped, arrefted, and brought
back to Paris in triumph. The alleged reafon for this do parture was the danger and infult to which the king, and more efpecially the queen, were expofed, from the licentious violence of the Parifian mob ; but there is no doubt that it was connected with the plans of the emperor Lcopold and the emigrants, who were prepared, by force of arms, to make a grand effort in behalf of a counter-revolution. The king's brother, with his confort, who took a different road, made their efcape. The national affembly pruceeded wish their labours, which they brought to a conclution on the following September. The conttitution, as fixed on at that time, was prefented to the king, who folcmonly accepted it, and fwore to maintain it inviolate. On the 30th of September, the national affembly, which has been knuwn fince by the name of the "Conftituent Affembly," diffolved itfelf, and gave place to the fucceeding "Legiflative National Affembly," which had been elected according to the rules prefcribed by the new conflitution. It was foon evident that France would have a foreign war to fuftain with the powers coalefced for the reftoration of the ancient monarchy, and for the further purpofe of making conquelts upon the French territories. In proportion to the national danger, the fufpicions of the people increafed, and their loft confidence in the king could never be recalled. New jealoufies were excited by the interpofition of the royal negative, allowed by the new conftitution, againft two decrees of the affembly, one levelled at the emigrants, the other at the non-juring priefts. War was declared by the allembly againft the emperor in April, and armies marched to the frontiers. A decree paffed the affembly for forming a cainp of 20,000 men near Paris, which Levis, conceiving it a pian defigned to overawe the more moderate party, and Itrengthen that of the Jacobins, refufed to fanction, as he did likewife a fevere decree againt the refractory clergy. He alfo difmiffed fome of the popular minitters who had been forced upon him. The difcontents which thefe meafures excited burft out into a furious infurrection on the 20th of June, in which an armed mob made their way into the Thuileries, and treated the royal family and their attendants with the groffeft perfonal infults. The king difplayed on this, as on all other occafions, great fortitude; and in reply to threats againft his life, repeated in the loweft and coarfelt language, he exclaimed, "Alas! would that my life could fecure the happinefs of the country, how readily would I offer it as a facrifice." A calm now fucceeded, in which the king and the national affembly appeared to unite in plans for the defence of the country: in the mean time dangers were accumulating, and the approach of the duke of Brunfwick, with the Pruflian army, preceded by a moft menacing manifefto, in which the king's acceffion to the new conflitution was reprefented as a mere involuntary compliance, itimulated the people almoft to madnefs. The republican party determined to take advantage of this circumitance, with a view of depofing the king, and inflituting a republic. At length, Petion, the mayor of Paris, appeared at the head of the fections, at the bar of the national affembly, to demand the depolition of the king. This was on the gth of Auguit; and at fix on the following morning the king was feen revierring his troops. He was received at firlt with thouts of Vive $l_{e}$ roi, which were flortly overwhelmed with thofe of Vive la nation. The king returned to the palace, and the multitude continued to collect. The national guard feemed undetermined what to do as they affembled in divifions near the palace, and, had a feady refiftance been made from within, it has been thought they would have joined the royal party. The king was advifed to feek protection in the fall of the national affernbly: he was willing to comply; $4 \mathrm{M}=$

## L E W I S.

but the queen oppofed, with vehemence, the humiliating propofal, till actual danger furrounded her perfon and children; fhe then confented, and the king, queen, the princefs Elizabeth, the king's fifter, with the dauphin and princefs royal, weut on foot to the hall of the affenbly. "I am come lither," faid his majelty, as he entered the doors, "to prevent a great crime. Among you, gentlemen, I believe myfelf in fafety." By an article of the conftitution, the affembly could not deliberate in prefence of the king. The royal family were, therefore, placed in a box feparated from the hall, where they remained 14 hours, without refrefhment, obliged to hear difcuffions in which the royal character and office were treated with every mark of infult. At length the fatal decree was paffed that the royal authority fhould be fufpended, and the nation was invited to elect a Convention, to determine on the nature of its future government. On that fatal day a numerous body of iufurgents attacked the palace of the Thuilleries, which was defended by Swifs guards: a bloody engagement enfued, which terminated in the maflacre of the greateft part of the Swifs, and feveral other regiments. As foon as the royal authority was fufpended, the king and his family were fent to the Temple as a ftate prifon. Maffacre fucceeded now upon maffacre, till at length, on the fecond and third days of September, the molt cruel and favage fcenes were exhibited that were ever witneffed in a civilized country. More than a thoufand ftate-prifoners were bafely and infamoufly murdered by the ruffians of the capital, a anong whom was the beautiful princefs of Lamballe, whofe bleeding head was carried on a pike through the ftreets of the city, and under the windows of the room in which the queen was confined, whofe intimate favourite fhe bad been. Thefe acts, to which the royal family could not be ftrangers, they might well regard but as preludes to their own death : there was no party left in the country to efpoufe their caufe; and no individual durft lift up his voice in their defence. The new convention was affembled on the 20th, and their firt decree was the eternal abolition of royalty, which was carried by acelamation : this object being attained the houfe adjoarned, and copies of the decree was fent into every village and commune of France. The moft violent meafures were adopted; nor could the moderate party in the convention reftrain the madnefs of the Jacobins, who were bent on levelling all diftinctions; to bring into contempt every thing in letters and in fcience that was in the leaft raifed above the comprchenfion of the loweft of the people. The intention was foon avowed of bringing the king to trial. It was in vain that thofe, who were anxious to fave his life, appealed to the inviolability of his perfon, declared by the conftitution he had accepted : principles, however facred, were made to yield, and a committee was appointed to give in a report upon his conduct. The refult of this was, that various accufations were brought againt him, and the convention refolved to take upon themfelves the part of accufers and judges. On the inth of December, the fallen monarch was brought to the bar to anfwer to the heads of accufation drawn up againlt him for the crime of tyranny and treafon towards the nation. He defended himfelf with judgment and prefence of mind, and received the advice and affiftance of three eminent advocates, who generoully and nobly undertook his caufe, though with great hazard to themfelves. The proceedings were carried on till the 26th of December, when M. Defeze, one of his advocates, read a defence of his client, which being finifhed, the king rofe, and holding a paper in his hand, pronounced, in a calm and dignified manner, and with an impreflive tone of voice, "Citizens, you bave heard my defence; I now fpeak to you, perhaps
for the laft time, and folemnly declare that my counfel have afferted nothing to you but the truth; my confcience reproaches me with nothing." The difcuffion was finally clofed on the 16 th of January; and after a fitting of 34 hours, the punifhment of death was awarded by a very fmall majority of the convention. M. Defeze then invoked the affembly, in the name of his colleagues, to confider by what a trifing majority the punifhment was pronounced againft the dethroned monarch; "Do not affict France," faid he, " by a judgment that will appear terrible to her, when five voices only were prefumed fufficient to carry it." He appealed to the eternal juftice and facred humanity, to induce the convention to refer their fentence to the tribunal of the people. "You have either forgoten or deftroyed," faid M. Tronchet, another of the king's advocates, "the lenity which the law allows to criminals, of requiring. at leaft two-thirds of the voices to conftitute a definite judgment." The fentence was ordered to be carried into execution without delay. The king and his family had been kept feparate from each other; but he was now permitted to fee them. The fhort interval allowed him he employed in the preparations for death enjoined by his religion, to which he was fincerely attached. The final meeting and feparation of the king from his family was affecting in the extrene. On the morning of the 2 if of January, at eight in the morning, he was fummoned to his fate. He afcended the fcaffold with a firm and dignified ftep; and his behaviour there partook of the calm fortitude which had diftinguifhed him through all his fcenes of fuffering. Raifing his voice, he exclaimed, " Frenchmen, I die innocent; I forgive my enemies." He would have proceeded, but was prevented by the beating of the drums, placed on the fpot purpofely to drown his voice. The executioners came forward to perform the bloody deed, which being perpetrated, the bleeding head was held up to the view of the furrounding crowd, of whom fome few exclaimed "Vive la Republique ;" but the great mafs of fpectators was too deeply abforbed in thought to join in the fhout which the leaders attempted to excite. The body of the deceafed victim was thrown into a pit filled with quicklime, and a guard placed around it till it fhould be confumed. The unhappy monarch was in the thirty-ninth year of his age, and the nineteenth of his reign. He left two children, a fon and a daughter, of whom the
 ing yeat. The queen was brought to the fcaffold in 1793, and his fifter in 1794. Such were the misfortunes to which this royal houfe was fubject. Lewis XVI. poffeffed from nature a good underftanding, which, however, was blunted by the early indulgences of a court. He had a ftrong fenfe of juftice, and his humanity was much fuperior to what could have been expected from a perfon in his high fation in life. By pofterity he will be regarded as one of the beft and moit virtuous of the French kings. He had acquired a large portion of general knowledge, and on fome literary fubjects he entered rather deeply. He wrote well, and excelled in clearnefs of expreffion and methodical arrangement. In vigour of mind he was unquellionably deficient; but in reviewing the hiltory of the period, we cannot conceive how he could have acted fo as to have fuccefsfully oppofed the voice of the people. It was his misfortune to have fallen on difficult times; he could not ftem the torrent of public opinion ; and it is probable that few princes, if any, would have been capable of extricating themfelves from fuch difficulties as furrounded Lewis XVI. during a great part of his calamitous reign. For farther particulars relating to Lewis's of France, the reader is referred to the Modern.Univerfal Hiftory ; to the Hifory of France, London, 1790 ;

## L E W

L. E WV
and to the Hiltory of the French Revolution, by Rabaut St. Etienne.

Lewis, John, a learned Englifh divine, was born at Briftol in 1675 . He was educated in grammar learning at the free-fchool of Winbourn, in Dorfet flire, and received his academical education at Exeter college, Oxford, where he took his degrees. Having been ordained, he officiated fome time as curate of St. John's, Wapping. In 1699 he obtained the rectory of Acris, in Kent, which he refigned in 1706, when he was prefented by archbihop Tenuifon with the rectory of Saltwood in Kent, with the chapelry of Hythe annexed. He was afterwards collated to the vicarage of Minfter, in the ifle of Thanet, and in 1719 archbifhop Wake conftituted hine mafter of Eaftbridge hofpital, in the city of Canterbury. He died at Margate in 1746. He was author of a great number of publications, which reflected credit on his induftry and learning; among thefe were "The Life of Wickliffe :" "Wickliffe's Tranflation of the New 'Teftament :" "The Hiltory and Antiquities of the Inc of Thanet :" "The Hiftory of the Abbey and Church of Feverfham :" "The Life of William Caxton:" "The Hifory of the Tranflations of the Holy Bible and New Teftament into Englifh."

Lewis, in Geography, is the molt northern, and the largeft of the Hebrides, or Weftern Illands, of Scotland. It is connected with the ifland of Hartis by a narrow ifthmus, which at low water is left entirely dry, and even at high water is not completely covered; whence the whole may be confidered as one ifland. (See Harris.) The ifle of Lewis is of very irregular form and boundary; and extends about 50 miles in length from north to fouth, by about twenty, on an average, in a tranfverfe direction. Towards the centre the land is mountainous and boggy; but near the fhore it is rather flat, and is interfected by numerous inlets or bays of the fea. The ifland is almolt deftitute of wood; a few birches, hazles, and a little heath, being the only fpecies of fhrubs feen here: but it is faid that Lewis was formerly covered with plantations; the decay and deftruction of which contributed to form the peat-earth, with which the illand abounds. Springs, lakes, and rivulets, fcattered through the inland, furninh in all parts abundance of frefh water. With refpect to the climate, the fpring is uncommonly cold and backward, the fummer warm, the autumn accompanied by profufe rains, the winter without long or fevere frofts, or very weighty falls of fnow, but with conftant winds, and thefe formy and fharply cold. Among the wild animals, the ifle fill produces deer or roes. Great numbers of wild fowls of many different fpecies frequent the thores, the lakes, and the cliffs of the mountains; among others, is the eider goofe, the down of which is held in high eftimation. Immenfe fhoals of fifh, of an innumerable diverfity of kinds, haunt the coafts.

The ifland is interfected by arms of the fea, called lochs, which run to a confiderable diftance inland, both from the eaftern and weftern fides. One of the chief is loch-Roag, on the welt, which is two leagues in breadth at the entry, and runs up, in a fouth-eaftern direction, about twelve miles into the ifland. This loch contains feveral iflands, fome of which are inhabited; one, called Large Bernera, is eight miles in length.' The whole of this curious lock abounds with fafe places of anchorage, fufficient to hold the whole Britifh navy, or even that of all Europe. About 540 tons of kelp, of a fuperior quality, are annually made from loch Roag. On the eaftern coaft, loch Seaforth runs into the country to a great diftance; loch Keofe and loch Leurbult advance alfo far inland from the eaft; but loch Stornaway is moft important, on account of the town which

Aands near it, and which is the capital of the inland. On the coaft, in this parifh, is a large cave, into which the fea enters at high tide ; this cavern is only acceffible from the fea. When it was firlt noticed, a great number of feals were killed annually in it; and the practice is ftill continued. The entrance of the cave is very theep and narrow, and does not admit more than the breadth of a fix-oared boat. The interior is divided by a iarge pillar into two arches. Its whole length is about an Englifh furlong.

The ifland of Lewis is divided into four parifhes; named Barvas, Lochs, Stornaway, and Uig. It has various fmall inets attached to it. In the parifh of Barvas is the inand of Rona, which is a mile in length, and half a mile in breadth; it is fituated in the Northern ocean, and is fup. pofed to be the fartheft to the north-welt of any land in Eu. rope. The parifh of Lochs derives its name from the great number of lakes which are interfperfed over its furface. It is about nineteen miles in length and nine in breadth : along the coaft it has a bold and rocky appearance; in the interior it is barren and inhofpitable. About 50 tons of kelp are manufactured here annually; and the greater number of the inhabitants are employed in the finheries on the coaft. The parifh of Stornaway is of very great extent; but the inhabited part is of a triangular form, of which two of the fides are about ten miles, the other feven. The town of Stornaway, from a very fmall origin, has of late, by the exertions of lord Seaforth, arrived at a confiderable extent. The harbour is excellent, and well frequented; the principal fource of employment is the profecution of the white and herring-filheries in the bays, in which about 35 or 40 fmall veffels are annually fitted out. It is a port of the cuftom houfe, and has a poft-office, and a regular weekly packet. The houfes of the town are, in general, well built : here are a convenient cuftom-houfe, a town-houfe, a commodious church, an affembly-room, and two fchool-houfes. On an elevated fituation, near the town, ftands Seaforth lodge, the feat of lord Seaforth, who is the proprietor of the inland. The parifh of Uigis fifteen miles in length, and thirteen in breadth: the interior is hilly, covered with heath, and interfperfed with fmall lakes; the coafts are mottly level and cultivated. The fifheries and the manufacture of kelp are here alfo the chief fources of fubfiftence to the inhabitants. Near the hamlet of Calarnifh, at a fhort diftance from loch Roag, is a Druidical temple, formed by a circle of twelve flones or obelifks, each about feven feet high, and fix feet diltant from each other: in the centre is one of a larger fize, thirteen feet from the ground: directly fouth from the circle are three obelifks, flanding in a line; another fach to the weft, and one to the eaft; each fone being nearly equal in fize, and arranged at equal diftances. Towards the north are two Atraight ranges of obelifks, forming an avenue to an opening between two of the ftones which form the circle. Each of thefe ranges confifts of fix ftones, regularly placed, one oppofite to another. All the fones are in a rough natural itate, as taken from the fhore. At Melifta are the remains of a nunnery, ftill called in the Gaelic Teagh nan cailichan don, "the houfe of the old black women." At Cailaway is a Danih fort, quite circular, with a double wall of ftone, thirty feet in height. This is broad at the bafe, and narrower at the top, like the fruftum of a cone. In the year 1794, there was living in this parih a lufius nature, of which Mr. Monro, the minifter, gives the following account in his ftatiftical report to fir John Sinclair.-"Very near the manfe there lives a woman, who has four diftinet breats or mamma. She has had feveral ftout, healthy children, and fuckled them, and likewife one of the minifter's children. She has nipples and milk in each of the four breatts; the

## LE W

two upper are fituated under the arm-pits, and by being diftended with milk, are very troublefome to her for the firft two or three months after delivery."

The population of Lewis, in the year 1796, was 8311 ; which was an increafe of 1925 from an enumeration which was made in the year 1755. The inhabitants of the whole ifland are fcattered, for the moft part, in fingle families, or clulters of two or three families, around the coalt, or through the interior parts. Some large tracts are without inhabitants; while upon others the population is more clofely affembled. There is fearcely any regular road: the moor, which reaches acrofs the iffand from Stornaway to Uig, is fo extenfive and foft, that it would require the labour of many ages to form a regular road through it. Martin's Defrription of the Weftern Iflands of Scotland, 8vo. 1716. Buchanan's Travels in the Weftern Hebrides, from 1782 to 1790, " 8 vo .1793.

Lewis, a town of America, in Effex county, S.W. of Lemington adjoining, in Vermont; about 8 , miles S . of the Canada line.

Lewis Grech, a fmall ftream in Vermont, which falls into lake Champlain at Ferrifberg, a little N. of Little Otter creek.

Lewis and Rchoboth, a town in Suffex county, Delaware, containing 1514 inhabitants.

## LEWISBURG. See Louisbourg.

Lewisburg, a county in Orangeburgh diftrict, South Ca-rolina.-Alfo, a polt-town of North Carolina, and capital of Franklin county, which lies on Tar river, and çontains between twenty and thirty houfes, a court-houfe, and gaol; 30 miles N. of Raleigh.-Alfo, a poft-town and chief town of Greenbriar county, Virginia, on the north fide of Greenbriar river, containing about fixty houfes, a courthoufe, and gaol ; 250 miles W. by N. of Richmond. N. lat. $38^{\circ} 8^{\prime}$.-Alfo, a polt-town of Northumberland county, Pennfylvania, cailed alfo "Tarltown," on the W. fide of the Sufquehanna, 7 miles above Northumberland; containing about 60 houfes, and well fituated for a good trade with the N.W: part of the flate ; 30 miles E. by N. from Aaronfburs-

LEWISHAM, a populous village, in the upper halfhundred of Blackheath, lathe of Sutton at Hone, and county of Kent, England, is fituated $5 \frac{1}{2}$ miles from London, and extends nearly a mile in length on the road to Bromley. Here was anciently a Benedictine priory, fubordinate to the abbey of St. Peter in Ghent, and moft probably founded in the Saxon times; this manor having been given to that abbey by Elthruda, niece to king Alired. After the fuppreffion of the alien priories, Henry V. made this a part of the endowment of his newly erected Carthufian priory at Shene. Lewilham is now the property of the earl of Dartmouth, whofe feat on Blackheath is within the bounds of this parifh. The prefent church was erected in the year 1774: its form is that of an oblong fquare, with a femicircular recefs at the ealt end for the altar. It contains two handlome monuments: one to the memory of Anne, wife of John Petrie, efq., was executed in Italy; it includes a fine bas-relief in marble, reprefenting the deceafed on her death-bed, with her hufband and children lamenting round ber. The other commemorates Margaret, relict of the Rev. Robert Petrie, and was fculptured by Banks: it reprefents Mrs. Petrie dying in the arms of Religion, fupported by Faith and Hope. Many old monuments were thrown carelefsly into the vault, when the church was rebuilt. An excellent free grammar fchool was founded by the Rev. Abraham Colfe, who was rector of this parith from the year 1610 to 1657 . His will contains the regulations
of the fchool, and directs that it fhall be for the education of thirty-one boys of the feveral parifhes the:ein named; one fcholar yearly to be fent to cither of the univerlities. He alfo founded an Englifh fchool here for thirty-one boys, and an alms-houfe for five "poor godly houfeholders." The population of Lewifham, as returned under the act of 1800 , amounted to 4007 ; the number of houres to 722 . In this enumeration was included the chapelry of Sydenham, noted for its medicinal fprings. Brayley's Beauties of England, vol. vii.

LEWISTOWN, a poft-town in Lincoln county, Maine, on the eaft fide of Androfcoggin river, and bounded fouthweft by Bowdoin; containing $9 \not+8$ inhabitants; 36 miles N.E. of Portland.-Alio, a pott-town, called "Lewes," in Suffex county, Delaware, pleafantly fituated on Lewes creek, three miles above its mouth in Delaware bay; containing a Prefbyterian and Methoditt church, and about 80 houfes, in a Areet more than three miles in length, extending along a creek which feparates the town from the pitch of the cape. Its fituation is high. The court-houfe and gaol are commodious buildings ; the entrance of the bay is crowded with veffels from all parts of the world, but during part of the winter is clofed with ice. The circumjacent country is beautifully diverfified with hills, woods, ftreams, and lakes, but much infefted with mofquitoes and fand-fies. This town carries on a fnall trade with Philadelphia in the productions of the country. A manufacture of marine and Glauber falts, and magnefia, has been eitablifhed here; 113 miles S. of Philadelphia. N. lat. $3 \mathrm{~S}^{\circ} 6^{\prime}$. W. long. $75^{\circ} 18^{\prime}$. -Alfo, the chief and poft-town of Miftin county, Pennfylvania, fituated on the north fide of Juniatta river, on the weft fide of, and at the mouth of, Cifhicoquilis creek; about 23 miles N.E. of Huntingdon; regularly laid out, incorporated in 1795, and containing about 120 dwelling. houfes, 523 inhabitants, a court-houfe, and gaol; $15^{\circ}$ miles W.N.W. of Philadelphia. N. lat. $40^{\circ} 33^{\prime}$. W. long. $77^{\circ} 23^{\prime}$.

LEWUNAKBANNEK, a town on the Ohio, in which is a fettlement of Chriftian Iudians, formed by Moravian miffionaries.
LEX, Law. See Law.
Lex Amiffa, or legem amittere, in Lawu, is undertood of an infamous, perjured perfon, who is faid to lofe bis lawv: or, as Bracton has it, non of ulterius dignus lege. See INfamols.

Lex Judicialis, is properly purgatio, per judicium ferri; fometimes called fimply judicium.
Lex Sacramentalis, purgatio per facramensum. See OAth and Purgation.
Lex Talionis. See Talio.
Lex Terre, the law and cuftom of the land; by which name it is diftinguifhed from the civil law. See Common Law.

## Lex, Legem terre amittere. See Amittere.

LEXAWASCEIN, in Geography, a fmall river of Pennfylvania, which rifes by feveral branches in Northampton county, Pennfylvania, on the ealt fide of mount Ararat, which unite about 10 miles from its mouth in Delaware river. It joins the Delaware, after a fouth-eaft and eaft courfe, about 174 miles above Philadelphia.
LEXEN, a town of Moravia, in the circle of Olmutz; 18 miles N.W. of Olmutz.
LEXIARCHI, $\Lambda \in \xi_{s x}$, 0 , at Athens, fix officers, afo fifted by thirty inferior ones, whofe bufinefs it was to lay fines upon fuch as came not to the public affemblies, and alfo to make fcrutiny among fuch as were prefent.
The lexiarchi kept a regitter of the age, manners, and
abilities of all the citizens, who were always enrolled at the age of twenty.

LEXICON, A\& $\xi$ Ixv, the fame with dietionary.
The word is chiefly ufed in fpeaking of Greek dic. tionaries: it is derived from the Greek $\lambda$ ets, word, dition; of $\lambda_{k} \mathrm{~F}_{\mathrm{L}}, I$ 万peak.

LEXINGTON, in Geography, a county of America, in Orangeburg diftrict, South Carolina.-Alfo, a poft-town of Virginia, and capital of Rockbridge county ; fituated on the poit-road from Philadelphia to Kentucky, by way of the Wildernefs, and about a mile fouth of the north braach of James's river; containing a court-houfe, gavl, and about 100 houfes. Its fituation is agrecable and healthy, and the adjacent country highly cultivated. Near it is " Libertyhall Academy," now "Walhington College," built of ftone, and capable of containing forty or fifty ftudents, and harfifomely endowed by the diftinguifhed perfonage whofe name it bears. The town is 159 miles W. by N. of Rich-mond,-Alfo, a poft-town of Kentucky, formerly the metropolis of that flate; fituated on a rich extenfive plain, in Fayette county, on the north fide of Town fork, a fmall fleam, that falls into the fouth branch of Elkhorn river. The town is built on a regular plan, and contains about 350 houfes, five places of public worfhip, a court-houfe, and gaol, and alfo an univerfity, with feveral manufactories and florehoufes. It is an agreeable flourihing town, on the head waters of Elkhorn river; 24 miles E. of Frankfort. The number of inhabitants is 1795 . Near the town was found, upon digging five or fix feet deep, a large flat ftone, covering a well, artificially ftoned; and in its vicinity are alfo the remains of two ancient fortifications, furnifhed with ditches and baltions, overgrown with large trees.-Alfo, a pofterown in Rowan county, North Carolina, 399 miles from Wahington.-Alfo, a fmall polt-town of Georgia, formerly called the "Great Falls," fituated on the fouth fide of Ogeechee river, on a beautiful eminence which overlooks the falls of the river; 2 miles from George town. Alfo, a town in Middlefex county, Maffachufetts, in miles N.W. of Bofton, having a neat congregational church, and a number of compact houfes. This town has been rendered famous by being the fcene of a battle, fought April 19, 1775, which may be confidered as the commencement of the American revolution. On the ground where this battle was fought is a fone monument, 10 feet high, with the following infcription: "Sacred to Liberty, and the Rights of Mankind!! The freedom and independence of America fealed and defended with the blood of her fons, \&c. \&c." Concluding, "The die was caft!!! The blood of thefe martyrs, in the caufe of God and their country, was the cement of the union of thefe ftates, then colonies, and gave the fpring to the fipits, firmnefs, and refolution of their fellowcitizens!" Morfe.

LEY, in Agriculture, a term ufed to fignify land in the ftate of fward or grafs.

Lex, Sir James, in Biography, a learned Englifh judge, whe flourifhed in the feventeenth century, the fon of Henry Ley, efq. of Jeffont, in Wiltthire, was, on acceunt of his great merit, made lord chief juftice, firft in Ireland, and afterwards in England. He was likewife created baron Ley, lord high treafurer, and earl of Marlborough. His reports were printed in the year 1659.

## Ley. See Lixivium.

LEYBA, in Geography, a town of: South America, in New Granada; 90 miles N.N.E. of Santa Fé da Bogota.

LEYBOURNE, William, in Biography, a mathematician, was originally a printer in London. He publifhed a courfe of mathematics ${ }_{2}$, which, was held in confiderable efli-
mation. He was author of a treatife on Surveying, a work on Dialling, and another work, entitled "The Trader"s Guide." He died about the year 1690 .

LEYDECKER, Melchor, a Durch divine, was born at Middleburg in $16 ; 2$. Having received a good education, he officiated as paftor of a church in his native place; and in 1678 was appointed profeffor of divinity at Utrecht, and foon after took his degree of doctor in divinity. He died, in 172 1. He was deeply read in theology, ecclefiaflical hiftory, and rabbinical learning; but he had no tafte for polite literature, and was exceedingly bigotted to his own notions. Still he was defirous of uniting the Lutherans and Calvinifts, and made fome ineffectual efforts for the purpofe. He was a voluminous wiriter, and his works are all written. in Latin: of thefe the chief are, "A Treatife on the Republic of the Hebrews," in 2 vols.: "An Analyfis of Scripture, with Rules for Preaching;" "A Hiftory of Janfenifm;" "A Continuation of the Ecclefiatical Hittory of Hornius, with Notes;" and "A Hiftory of the Church of Africa."

Leyden, Lucas Van. See Jacobs, Lucas.
LeYDen, in Geography, a city of Holland, the "Inugdunum Batavorum" of Ptolemy, and the "Caput Germanorum" of Antonine's Itinerary, is the capital of a fmall dilt ric, called "Rhynland," comprehending 49:towns or villages, and, next to Amfterdam, the largett and moft populous city of Holland; the number of inhabitants being eltimated at about 50,000 . It is fituated on the ancient bed of the Rhine, which, by means of various Atreams, divides it into a number of iflands, that communicate with one another by bridges, which are reckoned to be not fewer than 100. This city likewife carries on a daily intercourfe by boats with Amfterdam, Haerlem, Utrecht, Delft, the Hague, \&c. It has eight gates; and its ramparts are formed of earth, partly covered with turf, and partly faced with brick, and confifting of feveral baftions. The cloth manufactured at Leyden has been much celebrated, and $i t$, contains a ftaple-hall erected for the ufe of the manufacturers and merchants. The chief ftreet of the town is conftructed in the form of a crefcent ; and the principal public building is the town-houfe, which has nany fpires, and is a handfome flructure, with a fone front. In the burg cmaiter's chamber is a very capital painting of the Latt Judginient by Lucas of Leyden, for which the emperor Rodolphus is faid to have. offered as many gold ducats as would cover it; tegether with feveral other capital paintings, and a reprefentation of the famous fiege of 1574, wrought in tapeftry. The great church is one of the handiomett in Holiand. The common council of the city, called "Vroedfchap," is compofed of 40 perfons, who are required to be natives of Holland, 28 years of age, and Proteltants. Here are likewife four burgomatters, and eight echiv ns, and a grand bailiff, who adminilters juttice in civil and cruminal cafes, jointly with the echevins. The fair of Leyden is an ancient eftablifment, and fill much. frequented : it occupies by its booths, arranged under trees, and iang the borders of canals, about a fourth part of the town. In proof of the antiquity of this city, fome allege an ancient round tower, called the "Burght," about 600 feet in circumference, faid to have been erected either by the Romans or Saxons; but Jofeph Scaliger contends that it was built five or fix centuries ago by the comtes of Holland. This city was confiderably enlarged towards the fouth in the year 1389 ; but it has fuffered much from fieges and the plague. In the year 1574, the Spaniards land fiege to it ; but it was obflinately defended by the inhabitaits, and even by the women, who lined the ramparts, and performed the duties of foldiers.

During:

## L E Y

During this refiftance, the mifery of the inhabitants was extreme: 6000 perfons died of famine, and the diftrefs attending it ; fo that for 14,000 who furvived, there remained no more than 107 muids of wheat. The general of the Spaniards, apprized of their fituation, fummoned them to furrender; but they replied, that they could not want fubfiftence, as long as their left arms remained, on which they were determined to feed, whillt with the right they defended the city. The conftancy and courage of Adrian de Werf, burgomatter of the city, deferve to be recorded; when he was folicited by fome of the inhabitants to furrender, he told them, "My friends, fince I mult die, it is of little importance whether I fall by you or by the enemy; cut me to pieces, and divide them amengit you; I fhall die fatisfied, if by my death I can be the leaft ufeful." Juit as they were preparing to furrender, they received notice by fome pigeons, that relief was at hand; and the dykes of the Meufe and the Iffel having been opened, Louis Boilfot, admiral of Zealand, advanced with a number of troops in flatbottomed boats to their fuccour. The Spaniards, terrified by the inundation, abandoned the fiege. In memory of this event the inhabitants have been accuftomed every feven years to exhibit a fpectacle of the fiege. William Prince of Orange, juft recovering from a dangerous illnefs, was carried to Leyden, that he might in perfon thank the citizens for their brave defence; he alfo Iiberally rewarded Boiffot and Janus Douza, lord of Noortwyck, who commanded in the city, not forgetting the officers and foldiers; and befides granting feveral privileges to the city, he founded an univerfity, and appointed Janus Douza the firft curator. This univerfity, fays Mrs. Radcliffe, in her "Journey through Holland, \&c." would fcarcely be known to exift, if it had no more confpicuous objects than its buildings. The Dutch univerfities have no endowed foundations; fo that the profeffors, who have their falaries from the ftates, live in private houfes, and the ftudents in lodgings. The library, to which Jofeph Scaliger was a benefactor, is open only once in a week, and then for no more than two hours. To this, and other meafures of Dutch policy, it is owing that the univerfity has been of late years declining. There are ftudents, however, of many nations and different religious profeffion, no oaths being impofed, except upon the profeffors. Phyfic and botany are cultivated with much fuccefs; and there is a garden to which not only individuals, but the Eaft India company, contribute foreign plants. The falaries of the profeflor3, exclufively of fees from the ftudents, are nearly 2001 . a-year. The government of the univerfity is in the rector, who is chofen out of three perfons, returned by the fenate to the flates; the fenate confifts of the profeffors; and, on extraordinary occafions, the fenate and rector are directed by curators, who are agents for the flates. The tand adjoining to Leyden is very fertile and productive, and is much cultivated by gardeners, who fupply Amfterdam with vegetables; and the rich meadows and paftures in the environs furnifh excellent butter and cheefe. Leyden is diftant 14 miles N. of Rotterdam, and 19 S.W. of Amfterdam. N. lat. $52^{\circ} 9^{\prime}$. E. long. $4^{\circ} 20^{\prime}$.

The plays and players of the theatre of Leyden are not of the moft refined fort; farce has not yet quitted tragedy, nor has Punch quited farce; however, thele exhibitions amufe perfons, whofe tafte has not been formed upon refined models, and perhaps come more home to their bufinefs and bofoms, thau the tragedies of Sophocles, or comedies of Menander, would do, if they were now to be reprefented in the original Athenian manner.

As to mufic, mechanical chimes, every quarter of an buur ; carillons at noon, two or three times a week; and
huge organs, coarfely played, to more coarfe plafmody, contitute all that Apollo and the Nine Mufes have given to this place, in the way of harmony and melody, as far as we could difcover. Burney.

Leyden, a fmall ifland in the Eaft Indian ocean, near the coaft of Java, within view from Batavia.-Alfo, a fmall ifland in the gulf of Manar, near the W. coalt of Ceylon : 12 miles W . of Jaffnapatam.-Alfo, a fmall ifland in a bay of the Pacific ocean, on the N. coaft of New Guinea. S. lat. $3^{\circ} 5^{\prime}$. E. long. $135^{\circ} 39^{\prime}$--Alfo, a town of Pruffia, 27 miles S.S.E. of Konigfberg.-Alfo, a poft-town of America, in Oneida county, New York; 330 miles N.E. from Wafhington.-Alfo, a townhip in Hampfhire county, Maffachufetts, between Colerain and Bernarditon; 29 miles from Northampton, incorporated in 1784, and containing 1095 inhabitants.

Leyden Phial, in Elearicity, is a glafs phial or jar, coated both on the infide and outlide with fome conducting fubftance, for the purpofe of being charged, and employed in a variety of entertaining and ufeful experiments. See Coating and Charge.
It was thus called becaufe Mr. Cunæus, a native of Leyden, was fuppofed to have firt contrived, about the clofe of the year 1745 , to accumulate the electrical power in glafs by this method ; and hence the operation of charging and difcharging coated glafs, in general, has been denominated the Leyden experiment; and a vacuum produced in a jar of this kind has been called the Leyden vacuum. But Dr. Priefley, the hiftorian of electricity, informs us, that the perfon who firft made this great difcovery was Mr. Von Kleift, dean of the cathedral in Camin; who, on the 4 th of November, 1745, fent an account of it to Dr. Leiberkuhn at Berlin : however, thofe, to whom Mr. Kleitt's account was communicated, could not fucceed in performing his experiments. The views which led to this difcovery in Holland are ftated by Dr. Prieflley in the following manner: profeffor Mufchenbroeck and his friends, obferving, that electrified bodies, expofed to the common atmofphere, which is always replete with conducting particles of various kinds, foon loft their eleetricity, and were capable of retaining but a fmall quantity of it, imagined, that if the electrified bodies were terminated on all fides by original electrics, they might be capable of receiving a ftronger power, and retaining it a longer time. Glafs being the moft convenient electric for this purpofe, and water the mof convenient non-electric, they firft made thefe experiments with water in glafs bottles; but no confiderable difcovery was made, till Mr. Cunæus, happening to hold his glafs veffel in one hand, containing water, which bad a communication with the prime conducter by means of a wire; and with the other hand difengaging it from the conductor, when he imagined the water had received as much electricity as the machine could give it, was furprifed by a fudden fhock in his arms and breaft, which he had not in the leaft expected from the experiment. This experiment was repeated, and the firlt account of it publifhed in. Holland by Mr. Allamand and Mr. Mufchenbroeck; by the able Nollet, and M. Monnier, in France; and by Meffrs. Gralath and Rugger, in Germany. Mr. Gralath contrived to increafe the ftrength of the fhock, by altering the fhape and fize of the phial, and alfo by charging feveral phials at the fame time, fo as to form what is how called the elearical battery. He likewife made the hock to pafs through a number of perfons connected in a circuit from the outide to the infide of the phial. He obferved that a cracked phial would not admit of being charged; and he difcovered what is now called the refiduum of a charge. Dr. Wation,

## IEYDEN PHIAI.

about this time, obferred a circumflanes attending the operation of charging the phial, which, purfued, would have led him to the difcovery which was afterwards made by 1)r. Franklin. He fays, that when the phial is well electrified, and you apply your hand to it, youl fec the fire flan from the outfide of the glafs, wherever you touch it, and it crackles in your hand. He alfo obferved, that when a fingle wire only was faftened round a phial, properly filled with warm water, and charged ; upon the inltant of its ex. plofion, the electrical corrufcations were feen to dart from the wire, and to illuminate the water contained in the phial. Ife likewife found, that the froke, ia the difcharge of the phial, was, cateris paribus, as the points of contact of the non-electrics of the outlide of the glafs, which led to the method of coating glafs: in confequence of which he made experiments, that led him to conclude, that the effeet of the Leyden bottle was greatly increafed, if it was not principally owing to, not fo much the quantity of non-electric matter contained in the glafs, as the number of points of non-electric contact within the glafs, and the denfity of the reater of which thefe points confifted; prorided the matter was, in its own nature, a ready conductor of electricityHe farther obferved, that the explofion was greater from hot water inclofed in glaffes, than from cold, and from his coated jars, warmed, than cold. For lif manner of explaining the fhock of the Leyden phial, fee Afrlux.

Mr. Wilfon, in 1746, difcovered a method of giving the fhock to any particular part of the body, without affecting the reft : he alfo increafed the ftrength of the fhock by plunging the phial in water, thereby giving it a coating of water on the outfide as high as it was filled on the infide; he likewife found, that the law of accumulation of the electric matter in the Lejden bottle was always in proportion to the thinnefs of the ghlafs, the furface of the glafs, and that of the non-electrics in contact with the infide and outfide thereof. Mr. Wilfon made a variety of other experiments with the Leyden phial, which our limits will not allow us to recite.

Mr. Canton found, that if a charged phial was placed upon electrics, the wire and the coating would give a fpark or two alternately ; and that, by continuing this operation, the phial would be difcharged; though he did not obferve that thefe alternate fparks proceeded from the two coitrary eleftricities difcovered by Dr. Franklin.

The abbe Nollct made feveral experiments with this phial. He received a flock from a hottle, out of which the air had been exhauted, and into which the end of his conductor had been inferted. He afcribed the force of the glafs in giving a fhock, to that property of it, whereby it retained it more flrongly than conducters do, and was not fo eafily divelted of it as they are. He alfo firt tried the effect of the electric flock on brute animals, and enlarged the circuit of its conveyance. See Crucurt.
M. Monnier is faid to have been the firtt who difcovered that the Leyden phial would retain its eletericity for a confiserable time after it was charged, and to have found it to do fo for thirty-fix hours, in time of frolt; and it is re. markable that the French as well as the Englifh philofo. phers made feveral experiments, which, with a little greater degree of attention, would have led them to the difcovery of the different quality of electricity on different fides of the glafs. But this was referved for the ingenious doctor Franklin, who, in explaining the method of charging the Leyden phial, obferves, that when one tide of the glafs is electififed pofitively, or flus, the other fide is electrilied negatively, or minuls; fo that whatever quantity of fire io thrown upon one fide of the glafs, the fame is theown out

Vor. XX.
of the other ; and in a phial not-charged, none can lie thrown into the jufide, when none can be grot out from the outlide; and there is really no more electric fire in the phial after it is charged than befure; all that can be dune by charging being to take from one fide and consey to the other. Dr. Franklin alfo obferved, that glafs was impervious to clectricity, and that therefore, fince the equitibrium could not be reftored to the clarged phial by an internal communication, it muft be done by conductors externally joining the infide and the outfide. Thele capital difcoveries le made by obferving that, when a flial was charged, a cork-ball, fufpended on filk, would be attracted $\mathrm{b}_{j}$ the outhide coating, when it was repelled by a wire com. municating with the infide, and rice verfá. But the truth of this maxim appeared more evident, when he brought the knob of the wire communicating with the outtide coating within a few inches of the wire conmunicating with the infide coariug, and fufpended a cork-bail between them; for, in that cafe, the ball was attracted by thean alternately, till the phial was difcharged.

Dr. Franklin alfo fhewed, that when the phial was charged, one fide loft exactly as much as the other gained, in reftoring the equilibrium. Hanging a fmall linen thrad near the coating of an electrical phial, he obferved that whenever he brought his finger near the wire, the thread was attracted by the coating: for as the fire was taken from the inflde, by touching the wire, the out:de drew in an equal quantity by the thread. He likewife proved, that the coating on one fide of a phial received juit as much eicctricity as was emitted from the difcharge of the other, in the following manner: he infulated his rubber, and then, hanging a phial to the conductor, he found it could not be charged, even though his hand was held contlantly to it; becaufe, though the electric fire might leave the outfide of the phial, there was none collected by the rubber to be conveyed to the infide. He then touk away his hand from the phial, and forming a communication by a wire from the outfide coating to the infulated rubber, he found that it was charged with eafe. In this cafe it,was plain, that the very fame fire which left the outfide coating, was conveyed by the way of the rubber, the globe and the conductor, and the wire of the fire into the infide. This new theory of charging the Leyden phial led Dr. Franklin to obferve a greater variety of facts, relating both to charging and difcharging it, than other philofophers had attended to. This masim, that whatever the phial takes in at one furface it dofes at the other, led Dr. Franklin to think of charging feveral phials together with the fame trouble, by connecting the outide of one with the infide of another; whereby the fluid that was driven ont of the firlt would be received by the fecond, \&c. By this means he fourd, that a great number of bottles might be charged with the fame labour as one only : and that they might be charged equally high, were it not that every bottle receives the ilem fire, and lofes its old with forne reluctance, or rather gives fome fmall refiltance to the charging. On this principle he contructed an electrical battery:

When Dr. Fratrklin firft began his experiments upor the Leyden phial, he imagined that the electric fire was all crowded into the fubltance of the non-electric, in contact with the glafs; but he afterwards found that its power of giving a flock lay in the glafs itfelf, and not in the coating, by the following ingenious analyfis of the bottle. In order to find where the ttrength of the charged bottle lay, he placed it upon glafs; then firft took out the cork and the wire, and finding the sirtue was not in them, he touched the outlide ceating with one hand, and put the finger of the

## LE Y

other into the mouth of the bottle; when the fhock was felt quite as ftrong as if the cork and wire had been in it. He then charged the phial again, and pouring out the water into an empty bottle, infulated, expected that, if the force relided in the water, it would give the fhock, but he found it gave none. He then judged that the electric fire mult either have been loft in decanting, or muft remain in the bottle; and the latter he found to be true; for, filling the charged bottle with frefh water, he found the flock, and was fatisfied that the power of giving it refided in the glafs itfelf. The fame experiment was made with panes of glafs, haying the coating on lightly, and changing it as the water had been before changed in the bottle, and the refult was precifcly the fame. He proved in other ways that the electric fire refided in the glafs. Franklin's Letters and Obfervations, \&c. Priefley's Hift. of Electricity, vol. i. p. 191, \&c.

From the above account of Dr. Franklin's method of analyfing the Leyden phial, the manner of charging and difcharging it, and the reafon of the procefs, are eafily underthood. Thus, if a coated phial be placed near the prime conductor, fo that the knob of its wire may be in contact with it; and the winch of the machine be turned, the index of the electrometer, fixed to the cenductor, will gradually rife as far as 90 nearly, and then reft; which flews that the phiial has received its full charge; then if the difcharger be held by its glals handle, and one of its knobs be applied to the outide coating of the phial, and the other be brought near the knob of the wire, or near the prime conductur that communicaies with it, a report will be heard, and luminous fparks will be difcovered between the difcharger and the conducting fubftances communicating with the fides of the phial, alld by this operation the phial will be difcharged. If, inttead of ufing the difcharger, a perfon touches the outfide of the phial with one hanu, and brings the orther hand near the wire of the phial, the fame fpark and report will be obferved, and a flock will be felt, that affects the wrifts and elbows; and, when the fhock is ftrong, the breaft likewife; and a fhock may be given to any fingle part of the body, if that part alone be brought into the circuit. If a number of perfons join hands, and the firft of them touches the outfide of the phial, and the latt touches the wire communicating with the inlide, they will all feel the hock at the fame time. If the coated phial be held by the wire, and the outfide coating be prefented to the prime conductor, it wili be charged as readily, only with this difference, that in this cafe the outfide will be pofitive, and the infide negative; and if the prime conductor, by being connected with the rubber of the machine, be electrified negatively, the phial would be charged in the fame manner; but the fide that touches the conductor would be electrified negatively, and the oppofite fide would be electrified pofitively. But if the phial be infulated, and the fame procefs repeated, the index of the electrometer will foon rife to $90^{\circ}$, yet the phial will remain uncharged; becaufe the outfide, having no communication with the carth, \&c. cannot part with its own elcctricity, and, therefore, the infide can acquire no additional quantity; but when a chain, or any other conductor, connects the outlide of the phial with the table, the phial may be charged as before. Moreover, if a phial be infulated, and one fide of it, inftead of being connected with the earth, be connected with the infulated rubber, whillt the other fide communicates with the prime conductor, the phial will be expeditioully charged; becaure, whilf the rubber exhaufts one fide, the other fide is fupplied by the prime conductor; and in this way the phial is charged with its own electricity; or the natural
electric matter of one of its fides is thus thrown on its. other fide. This la't experiment may be diverlified, by infulating the phial, and placing it, with its wire, at the diftance of about half an inch from the prime conductor, and holding the knob of another wire at the fame diftance from its outfide coating; then turning the winch of the machine, and a fpark will be obferved to proceed from the prime conductor to the wire of the phial, and another fpark will pafs at the fame time from the outfide coating to the knob of the wire prefented towards it ; and thus it is feen, that as a quantity of the clectric matter is entering the infide of the phial, an equal quantity of it is leavin, the outfide. If the wire prefented to the outfide of the phial be pointed, it will appear illumimated with a far; but if the pointed wire be connected with the coating of the phial, it will appear illuminated with a brub of rays. See Charge, Electrical Experiments, \&c. Electricity, Electrometer, \&c.

Mr. Cavallo has defcribed the conftruetion of a phial, which, when charged by an electrical kite, in examining the tate of the clouds, or in any other way, may be put into the pocket, and which will retain its charge for a confiderable time. Béfides the coating on the inlide and outfide, which this phial has like others of the fame kind, a glafs tube open at Goth ends is cemented into its neck, and paffes', within the phial, having a finall wire faltened to its lower extremity, which touches the infide non-electric coating. The wire, with the knob of this phial, is cemented into another glafs tube, which is nearly twice as long, and fmaller than the tube cemented into the neck of the phial. The wire is cemented in fuch a manner, that only its knob projects out of one end, and a fmall length of it out of the other end of the tube. If this piece, with the wire; be held by the middle of the glafs tube, it may be put in or out of the tube, which is in the neck of the phial, fo as to touch the fmall wire at the lower extremity of it; and this may be done without difcharging the phial, if it be charged. A phial of this kind has been kept in a charged ftate for fix weeks. Cavallo's Elect. p. 340. See Conductor.

We flall clofe this article with an account of the method by which Mr. Cavallo repairs coated phials, that have been cracked or perforated, either by a fpontaneous difcharge, or other accident. He removes the outlide coating from the fractured part, and then makes it moderately hot by holding it to the flame of a candle; and whill it remains hot, he applies burning fealing-wax to the part, fo as to cover the fracture entirely; taking care that the thicknefs of this wax coating may be greater than that of the glafs. Laftly, he covers all the fealing-wax, and alfo part of the furface of the glafs beyond it, with a compolition made with four parts of bees wax, one of refin, one of turpentine, and a very little oil of olives. This he fpreads upon a piece of oiled filk, which he applies in the manner of a plafter. In this way feveral phials have been fo effectually repaired, that, after being frequently charged, they were at lalt broken by a fpontaneous difcharge, but in a different part of the glafs. Phil. Tranf. vol. 1xviii. part ii. p. 1011 .

LEYGAGER is ufed for wager of law.
LEyMEN, or Leinen, in Geography, a town of Germany, in the palatinate of the Rhine; eight miles S. of Heidelberg.

LEYSERA, in Bofary, fo denominated by Linnaus, in honour of Frederick William Von Léyfer, author of the Flora Halenfis, publifhed in 1761, in one volume octavo. 'I'his is a fynoplis of the plants found about Hall in Saxony", difpofed according to the Linnzan fyttem, with fcarcely any fynonyms. The number of fpecies is only 1122 , embracing few novelties or rarities, and bearing a great analogy to the lowland Flora of Britain. Haller, however, in his Bibl. Bot.v. 2. 510, terms it "a rich Flora, with original remarks, as well as new plants." The mof original part feems, in our opinion, a chronological and local diftribution of the plants, inferted by way of appendix: A fecond edition appeared in 1783 .-Linn. Gen. 431. Schreb. 563. Willd. Sp. Pl. v. 3.2132. Mart. Mill. Dict. v. 3. Ait. Hort. Ker. v. 3. 229. Thunb. Prodr. 160. Jufi. 179. Lamarck. Illuftr. \&. 688. Gxertn. t. 173. (Afteropterus; Vaill. Mem. de l'Acad. des Sc: 1720 Gærtn. 460. t. 173.) Clafs and order, Syngenefia Polygamia-fuperflua. Nat. Ord. Compofite Difcoidec, Linn. Corymbiferc, Juft.

Gen. Ch. Common Calyx ovate, imbricated ; fcales obtufe, concave, fcariole. Cor. compound, radiated; ficrets of the difk feveral, perfect, tubular, funnel-fh3ped, five-cleft, mearly erect ; thofe of the radius feveral, ligulate, lanceolate, entire. Stam. (in the perfect florets) Filaments five, capillary, very fhort ; anthers united into a cylindrical tube. $P i f$. (in the fame) Germen fmall; ftyle thread-fhaped; itigma notched. In the female ones the ftyle is fhorter, and the ftigma more divided. Peric. none, except the unchanged calyx. Seed, in both kinds of flurets, folitary oblong; down, in thofe of the difk, long, of five feathery brillies, furrounding a very fhort chaffy crown; in thofe of the radius the feaihery briftles are wanting. Recept. naked in the dilk, the florets of the circumference only being feparated by narrow chaffy fcales.

Obf. In Leyfera paleacea the feathery britles of the radius are wanting. Gartner reftrains the genus of Leyfera to fuch fpecies, keeping Vaillant's mame Afteropterus for thofe which have the two kinds of feed-down as above defcribed; but fuch a diftinction appears to us, as it did to Linnæus, merely to feparate a very natural genus, and it ferves, among many other inftances, difplayed in this part of Gærtner's admirable work, to prove that technical characters muft never be followed, without taking natural ones as a clue.

Eff. Ch. Receptacle chaffy in the circumference. Seeddown chaffy; in the florets of the difk mofly feathery alfo. Calyx fcariofe.

Linnæus has three fpecies of this genus.

1. L. gnaphalodes. Linn. Sp. Pl. 1249. Levf. Hall. ed. 2; frontifpiece, infcribed " unicum pramium, fed immortale." (After æthiopicus, ftoechadis foliis, flore aureo; Herm. Lugd. Bat. 6S. t. 71.)-Leaves linear-awlhaped, downy and glandular. Calyx-fcales lanceolate.-Native of the Cape of Good Hope, as are all the known Ipecies hitherto difcovered. The flem is fhrubby, determinately branched, leafy, downy. Lefaves copious, fpreading every way, fcattered, briftle-fhaped, hardly an inch long, downy, as well as befprinkled with little prominent glandular brittles. Flowers moitly terminal, folitary, on long flender ftalke, with yellow
rays, and a fhining membranous ealyx. The feathery down of the feeds is very confpicuous among the numerous floret3 of the dijk.
2. L. Callicornic. Linn. Mant. 286. (Calicorni gnaphaloides; Burm. Prodr. 24. Hieracii peculiare genus, coridia folio, $x$ thiopicum, feminum pappis denfius radiatis; Pluk. Mant. 103. Phyt.t. 35 c. f. 4.)-Leaves linear-threadhaped, rough. Scales of the calyx acute. Flowers nearly feffile. This differs at firft fight from the former in its feflite flowers, folitary at the fummit of each branch, and the fcales of the calyx are more pointed.
3. L. paleacea. Limn. Syft. Veg.ed. 13. 541. ed. $14 \cdot 771$. (L. ericoides; Berg.Cap. 29 + Reihania paleacea; L'Hetit. Sert. Angl. 24. Thunb. Prodr. 146. Willd. Sp. Pl. v. 3. 2137.)-Leaves linear, channelled, downy. Calyx feffile, turbinate; its inner feales thin and pointed. Feathery down wanting. Marginal fcales of the receptacle furmounting the florets. - The leaves of this are not fo flender as either of the former, being triangular, furrowed above, very cottony, but not glandular. Flocuers feflile at the end of each branch, folitary. Outer fcales of the calyx lefs fcariofe than in the former. On account of the want of the feathery feed-down, M. l'Heritier referred this fpecies to his genns Relbania, which is rather a heterogeneous aliemblage. In this, however, he is followed by Thunberg and Willdenow, who alfo agree in removing the Linnatan Stabelina gnaphaloides to Leyfera, a meafure which feems to us rather unnatural.

Thunberg adds feven more fpecies to this genus, the fpecific characters of which are given in his Prodromus, but nothing more is known concerning them. They are named ciliatu, incana, arauoides, Pilofilla, ovata, piãa, and polifolia.

LEYTA, in Geography, one of the Philippine inlands, about 250 miles in circumference; the foil is fo fertile as to yield two hundred fold ; the mountains abound in deer 2 cows, wild hogs, and fowls; cocoas grow fpontaneoufly; the air is pure and healthy; and more temperate than at Luçon. The inhabitants are mild and peaceable in their difpofition, and hofpitable to ftrangers. Their number is eftimated to be about 9000 , who pay tribute in wax, rice, or cloth. N. lat. $10^{\circ} 5^{\prime}$. E. long. $124^{\circ} 40^{\prime}$.

LEZAISKO, a town of Aultrian Poland, in Galicia; 56 miles W:N.W. of Lemberg.

LEZANDRIEUX, a town of France, in the department of the North Coalts, and chief place of a canton, in the diftrict of Lannion, four miles $\mathbb{E}$. of Treguier. "I'he place contains 1763 , and the canton 12,289 inhabitants, on a territory of $142 \frac{1}{2}$ kiliometret, in fix communes.

LEZERS, an Indian nation, which inhabit o between the mouth of the Ohio and Wabafh rivers. They can furnifh 300 warriors.

LEZIGNAN, a town of France, in the department of the Aude, and chief place of a canton, in the diftrict of Narbonne. The place contains 1505 , and the canton 6827 inhabitants, on a territory of 270 kiliometres, in $1_{7}$ communes.

LEZOUX, a town of France, in the department of the Puy-de-Dome, and chief place of a canton, in the diftrict of Thiers; feven miles W.S.W. of Thiers. The place contains 3307 , and the canton $10, j 81$ inhabitants, on a territory of $197 \frac{1}{2}$ kiliometres, in 12 communes.

LGOV, a town of Rufia, in the governmeat of Kurf. N. lat. $48^{\circ}$. E. long. $35^{\circ} 54^{\prime}$.

LHOTA, a town of Bohemia, in the circle of Konigin. gratz: fix miles S.E. of Trautenau.

LHOTKA, a town of Bohemia, in the circle of Konigingratz ; If miles W. of Konigingratz.

## L I A

LIADOVA, a town of Moldavia, on the Dniefter; 56 miles E.N.E. of Choczim.
I.IAISON, Fr. in Mufic, connection, relation, combieation. See Relative.
LIALSKOI, in Geography, avtown of Ruffia, in the province of Ulting, on the Vim; 48 miles E. of Yarenk.

LIAM, a town of Lower Siam, on the E. fide of the gutf. N. lat. $12^{\prime \prime} 33^{-1}$. E. long. $102^{\circ} 18^{\prime \prime}$.

LIAMONE. a river of Corica, which runs into the fea; 10 miles N . of Ajaccio. It gives name to one of the two departnents into which Corfica is divided; the other being Colo. It is formed by the fouthern part of the illand, in N. Lat. $4^{1} 3^{\circ}{ }^{\prime}$, containing 149 \{quare leagues, and 63.347 i:habitants. It is divided into three circles, viz. Vico, containing 10,079 intabitants; Ajuccio, 26,918; and-Sartone, including 26,3 So inhabitans. In the vallies and acchivities of the hil's, the fcil is fertile, yielding grain, fruits, paftures, and, in fome diftricts, delicious wines.

LIAM-PO. Sce Ning.ro.
I.LAMSA, a town of Ruffia, ia the goverment of Archangel, on the coatt of the White fea; $3^{6}$ miles N.N.W. of Oneg

LIANCOURT, a town of France, in the department of the Oife, and chief place of a canton, in the diltrict of Clermont; four miles S. of Clcrmont. The place contains 962, atd the canton 10,365 inhabitants, on a territory of 125 kiliometres, in 22 communes.
L.IANGA, a town on the E. coall of Mindanao. N. lat. 8 -21'. E. long, $126^{\prime}$ ro'.

LIANG-CHAN, a town of Corea; 40 miles S.S.E. of Kang-tcheor.

LIANGDAL, a river of Sweden, which rifes in the province of Harjedalen, and runs into the gulf of Bothnia, - near Sundfwal.

IIAAN-TCHUEN, a town of Corea; 25 miles E.N.E. of Haimen.
LIAR-DSAKE, a lake of Thibet, about 30 miles in circumference. N. lat. $34^{\circ} 34^{\prime}$. E. long. $90^{\circ} 44^{\prime}$.

LIATRIS, in Botany, a name of whofe meaning or origin we are not able to difcover any thing fatisfactory. Gartn. t. 167. Schreb. 542. Willd. Sp. Pl, v.-3. 1634. Mart. Mill. Ditt. v. 3. (Suprago; Gxrtn. vo 2. 402. Anonymos, n. 309 ; Walt. Carol. 196. Cirfum ; Dill. Elth. t. 71, 72. See Serratuia ; Juff. 174.) -Clafs and order, Syngenefia Poly-gamia-ezualis. Nat. Ord. Compofita capitata, Linn. Cinarocephala, Juff.

Gen. Ch. Common Calyx oblong, imbricated, of numerous, fomewhat ovate, unarmed, coloured feales. Cor. compound, uniform, tubular; forets are perfect and equal, monopetalous, funnel-flaped; their tube inflexed; limb in five recurved fegments. Stan. Filaments five, capillary, very fhert; anthers usited into a cylindrical tube. Pijf. Germen to each floret, oblong; fylc thread-fhaped, very long, divided as far as the top of the ftamens, ftraight ; ftigmas rather acute. Peric. none, excepe the permanent unaltered calyx. Seeds folitary, angular; down feffile, feathery, fometimes coloured. Recopf. naked, flat.

EG: Ch. Receptac'e naked. Calyx oblung, imbricated, unarmel, colourcd. Down leathery.

This genus appears to have been criginally feparated from Serratula by Gertner, who altered the name by which he at firlt datinguifhed it, Suprozo, to that it now bears. Serratula differs from it in having a fcaly or hairy receptacle, as well as in habit. Dight fpecies are defined by Willdenow, of which the following are the mot characteritic and remarkable.
E. Jocr:ofa. Willd. n. 2. (Serratula fcariofa; Limn.

Sp. Pl. 114\%. Eupatorio adfinis americana buibota, flori. bus fcariofis calycibus contectis; Pluk. Phyt. t. 177. F. 4.) -Lcaves lanceolate, tapcring at each end, rough-edged. Flowers on long bracteated italks. Calyx-fcales obovate, fpreading.-Native of North America; fometimes feen with us in curious gardens, where it is a hardy perennial. Root a bulb-fhaped tuber. Stem three or four feet high, leafy, finely hairy, racemofe at the upper part, each flower fupported by a flalk from two to four inches long, bearing a few leafy lratiens. The figmas are long, purpliih, as well as the florets. Calyx-facales more or lefs obtufe, leafy, widely spreading.
L. elegans. Willd. n. 3. (Staehelina elegans; Walt. Carol. 202. Serratula fpeciofa; Ait. Hort: Kew. v. 3. 13S.) -Leaves linear, dotted. Spike very long and denfe. Calysfcales lanceolate, acute, hairy; the invermoft elongated, coloured, fomewhat toothed. Florets few.-Gathered by Bartram, in Georgia, in 1763 ; by Walter in Carolina. The upper flem-leaves are widely fpreading, or reflexed; lower longer, more diftant and upright ; all finely dotted on both fides. Spike long, denfe, erect, hender, of numerous, nearly feffile, bracteated flowers, whofe long, leafy, fine pink, inner fcales of the caly $x$ are very beautiful.
L. pilofa. Willd. n. 4. (Serratula pilofa; Ait. Hort. Kew. v. 3. 13S.)-Leaves linear, hairy, fomewhat dotted. Clufter long, loofe, hairy. Bracteas and calyx-fcales obtufe, fringed.-Native of North America, from whence it was introduced, in $\mathrm{I}_{7} 8_{3}$, into Kew garden, where we gathered it in flower twe years after. It is perennial and hardy, blooming in the autumn. As there is no defcription nor figure extant, the following may be acceptable. The flem is three feet high, fender, leafy, angular, clothed with longifl fcattered hairs, at leaft in the upper part. Leaves narrow, reflexed, fringed with fimilar hairs, and irregularly dotted on both fides; the upper ones dilated at the bafe, and embracing the ftem. Cluffer terminal, fimple, long, loofe, leafy, nightly hairy. Flower Ralks about an inch long, axillary, bearing at their upper part two or three fhort, obtufe, fringed, dotted braleas, refembling the lower fcales of the calya; whofe inner-fcales are graduailly longer, with a membranous, fringed, white or reddifh edge. Flerets and figmas pink.

We cannot but lament, that while fo many well-known plants are figured over and over again in every publication, fuch curious and beautiful fpecies as the two latt fhould remain neglected and unknown.
L. Spicata. Willd. n. 6. (Serratula fpicata; Limn. Sp. Pl. $11+7$. Cirfum tuberofum, lactucx capitulis picatis; Dill. Elth. 85. t. 72. f. 83.)-Leaves linear, ditantly dotted, fringed at the bafe. Spike leafy; denfe above. Ca-lyx-fcales obtufe, fmooth - Native of various parts of North America, from whence it was brought to the Engling gasdens about eighty years ago, and itill remains at Kew. The nearly feffite foacers, and imooth-edged calyz, ditainguifh it from the lait, to which it is otherwife nearly allied.
L. odoratifima. Willd. n. S. (Anonymos odoratiflimus; Walt. Carol. 19S.)-Leaves elliptic-oblong, fmooth; the upper oncs heart-fhaped, clafping the ftem. Panicle corymbofe, fpreading. Calyx-fcales obovate, glandular.-Gathered by Walter in Carolina; from whence it was brought by the late Mr. Frafer in 1787 . This fpecies is remarkable for its fine feent when dricd, which refembles that of the Woodruff, and Holcus odoratus. The radical leaves are ftalked, three or four inches long, nearly elliptical; thofe of the ftem numerous, much fmaller. Flozvers fmall, purple, very numerous, in a fmoothih, fpreading, bracteated, corymbole panicle. Florets not numerous.

LIBA,

LIB

LIBA, in Geograply, a town of Bohcmia, in the circle ef Saatz; 10 miles E. of Eger.
LIBAN, a town of Bohemia, in the circle of Boleflaw ; 12 miles E S.E. of Jung-Buntzel.
LIBANIUS, in Biography, a celebrated Greek fophit, or rhetorician, was born of an ancient family at Antioch, about the year 314. He devoted himfelf from his youth to the interefts of literature, and purfued his ftudies at Athers. Havine tinifhed his education he collected difciples, and made himfelf known by various rhetorical compolitions. His reputation was fo high at Conftantinople, that fome other profeffors, jealous of his fame, procured his banifhment on the charge of magic. He then went to Nicomedia, where he obtained a great number of difciples, among whom, in a private n:snner, was Julian, afterwards denominated the Apottate. He finally returned to Antioch, where he fpent the remainder of his day.. About the year 360 , he was preceptor to Bafil and Chryfoftom, perfons afterwards very celebrated in the church, though he was always zealoufly attached to the ancient religion; and on the acceflion of Julian, he was one of the firt whom that emperor invited to be near his perfon. He declined the honours intended him, preferring a life of privacy to the bußle of a court. He was, however, warmly attached to a prince who patronized his fludies, and fupported the fane religious caufe; and was enabled, by the influence which he had over him, to foften many of the emperor's refentments. Julian admitted him to the equality of a friend, and is thought to have derived fome affiltance from him in his compofitions. He furvived to an advanced age, but the time of his death is not known. The writings of Libanius were very numerous, confilting chiefly of orations, declamations, differtations, and epiltles; which are characterized by Gibbon as, "for the molt part, the vain and idle compofitions of an orator who cultivated the fcience of words:" yet he admits that he had merit, and that his correfpondence was various and elaborate ; " he praifed the virtues of his own times; he boldly arraigned the abufes of public and private life; and he eloquently pleaded the caufe of Antioch againft the juit refentment of Julian and Theodofius." Some of the works of Libanius, confilting of his orations, declamations, \&c., were publifhed in two volumes, folio, in Greek and Latin, in the years 1606 and 1627 ; but the molt complete collection of his epittles is that publihed at Amiterdam in 1733. A volume, containing feventeen of his harangues, from the library of St. Mark, was printed at Venice in 1755. In reference to the conclufion of this writer's life, Gibbon obferves, "it is the common calamity of old age to lofe whatever might have rendered it defirable; but Libanius experienced the peculiar misfortune of furviving the religion and the fciences, to which he had confecrated his gemius. The friend of Julian was the indignant fpectator of the triumph of Chriltanity ; and his bigotry, which darkened the profpect of the viifble world, did not infpire Libanius with any lively hopes of celeflial glory and happincfs." The judicious and excellent Lardrer has tranllated the whole of Libanius's oration to the emperor 'Theodofius, every part of which, he fays, is of innportance to Chriftians. The occafion of this oration was, that in the reign of Theodofius, feveral heathen temples had been pulled down and deftroyed by the monks, with the confent or connivance, as Libanius thought, of the bifhops, and without the orders of the emperor to that purpofe. Of this Libanius complains and implores the protection of Theodofius, that the temples may be preferved. Dr. Lardner, therefore, gives the oration at length, to thew that the teftimony of this heathen writer weat- directly to
prove the divine origin of Chrifianity. And he conclutes by maintaining, that the greatnefs and fplendour to which the Chritlian church had attained from fmall begiunings, by the force of truth againit worldly terrors and allurements, was a greater wonder and a work of greater power than the magnificence of Rome and the grandeur of her empire. Libanius has given an interelling detail of the private life of Julian, quoted and referred to by Gibbon; the mention of which affords us an opportunity of making an additional reference to the article Juidan in our laft volume. Thic works of Dr. Lardner flould have been cited as containing a fummary of the arguments refpecting the extraordinary interpofitions that prevented this emperer from rebuilding the Jewifi temple. Sec Lardner's teffinoonies of Ancient Heathens, vol. iv. or vol. viii. edit. 1 z88. Gilbor, vol. iv. Moreri.
Limanius, Geonge, who flourifhed in the fixteenth century, was defcended from a refpectable family at Lignitz, in Poland, of which place he was a native. He purfued his fludies for feveral years in the moft celebrated German univerfities; and coming to refice at Cracow, he was appointed one of the profefiors in the principal college of that city. He is faid to have been the firft perfon who introduced there the fludy of the Greek language. He publifhed feveral works : as "Economicorum Aritotelis Libri Gracis et Latinis Annotationibus illuftrati;" "Carmina Sibyllx Erithrex, \&c.;"" Paraclefis, id eft adhoriatio ad Gracarum Litcrarum ftudiofus, habita Cracovix;" "De Mudicx Laudibus Oratio, \&ec." He alfo compiled an "Anthology," or choice Collections from the Works of St. Baliit, St. Gregory Nazianzen, and St. Chryfoftom. Moreri.
 cies of divination performed with frankincenfe; which, if it prefently caught fire, and fent forth a grateful odour, was eitcemed a happy omen, and vice verfà.
LIBANOTIS, in Botany, the ancient appellation of a plant, fuppofed by fome to have been the name of a boy, changed into the plant in queftion; but the moft evident and generally received etymology is from $\lambda_{1} \beta_{a v o s,}$ frankincenfe,
 of Diofcorides appears to be our Rofemary, as has beea ufually fuppofed; which fhrub is by the modern Greeks called Itsigcoispuyy, or Tree Libanos. Libanotis however has at different times, been employed to defignate various umbelliferous plants, of an aromatic quality, and generally of menastain origin, which may have been found under the genera of Albamarta, Cachrys, Buplcurum, Sc.
LibanUS, in Geography. See Lebanon.
Liba'tion, Libatio, a ceremony in the heathen facrifices, wherein the prielt filt fome water, wine, milk, or other liquor, in honour of the deity to whom the facrifice was offeried; after having firft tafted it himfelf.
Alcxander is faid to have facrificed a bull to Neptune; and, for an offering to the fea-gods, to have thrown the golden veffels ufed for the libation into the fea.
Libations were alfo in ufe under the law of Mofes, beirg enjoined by God in Exodus xxix. and Numbers xy.

LIIBAU, in Geography, a fea-port of the duchy of Courland, fituated on the Baltic, built by the Lettonians, and deriving its name, as it is faid, from the word " Leepaja," which, in the Lettonian language, fignifies a piece of ground planted with linden-trees, fuggelted by the circumfiance that many of thefe trees formerly grew here. This etymology is further confirmed by the conlideration that the Lettonians even now call the town "Ieepaja." Some Germans intermixed with the intarbitants of this town in the
$13^{\text {th }}$ century, and about the clofe of the fifteenth, and commencement of the 1 oth centuries, many of that nation united together, and in 1625 it obtained the privileges of a city. In 1737, the harbour was cleared by Ernelt John, and the future accumulation of mud and fand prevented, fo that it is now a commodious port for veflels of light burden; a confiderable number of which repair hither and are loaded with hemp, linfeed, \&cc. This town was often taken by the Swedes, but ceded to Courland by the peace of $1660 ; 66$ miles W. of Mittan. N. Iat. $55^{\circ} 28^{\circ}$. E. Iong. $21^{\circ} 37^{\prime}$. In this part of the Baltic, as well as in the whole province of Courland belonging to Ruffia, accounts are kept by merchants, as at Riga, in Alberts dollars of eighty ferdings, or of ninety Alberts grofehen; but retail traders moltly reckon two guldens of ninety current grofchen, four of which are equal to three Alberts grofchen. The coins chiefly circulating here are Dutch ducats, and Alberts dollars; and allo pieces coined in the country of the fame flandard and value with thefe two coins. The ferding is an old filver coin; but the grofche is inaginary. The Ruflian coins are alfo current here. (See Riga.) The laft of wheat, rye, barley or peafe, contains 48 leofs; that of oats and malt 60 leofs, which are equal to 106 Eriglifh buthels; fo that a leof of wheat contains about $10 \frac{1}{2}$ Euglifh quarters, and a latt of oats ${ }^{1} 3^{\frac{1}{7}}$ Englifh quarters: one hundred lafts of falt are equal to 11,110 Englifh bufkels. Libau exchanges with London at four Alberts dollars fifty grofchen, more or lefs, for il. Aterling, at three months date. The old ftyle is ftill ufed at Libau. Kelly's Un. Cambilt, vol. 1.

LIBAVIUS, Anpreco, in Biography, a phyfician and chemilt, was born at Hall, in Saxony. He was profeffor of hittory and poetry at'Jena, in 1588 . But he removed to Rothenburg, on the Tauber, in 1591, and to Coburg, in Franconia, in 1605 , in confequence of an appointment to the office of principal of the college of Cafimir, at that place. He died at Coburg in 1616. Libavius obtained a confiderable reputation in his time by his chemical works, having purfued that fcience upon better principles than moft of his contemporaries. He employed many chemical preparations in medicine; neverthelefs, he avoided the violence of Paracelfus and his difciples, whofe principles he often refuted, and againit whom he frequently defends the doctrines of the Galenical fehool. But, like the chemical philofo. phers of the age, he did not altogether efcape the delufions of alchemy. He left his name long attached, in the laboratories, to a particular preparation of tin with muriatic acid, which was called "the fuming liquor of Libavius." It is unneceffary to enumerate the titles of his many works, which have now become obfolete, and are almoft forgotten. His laft work, publifhed at Francfort in 1615 , under the title of "Examen Philofophix Novæ, que veteri abrogandse, opponitur," folio, is remarkable for the firf mention of the transfution of blood from the veffels of one living animal to thofe of another, of which he fpeaks with great confidence. The fuggeltion, however, was not fubmited to the teft of experiment until the middle of the fame century, when the fubject made a great noife throughout Europe, and many phylicians anticipated from it no lefs than a remedy againt all difeafes; nay, fome of them felt a confident expectation of rendering life perpetual. But thefe notions were prefently confuted by the numerous fatal terminations of the experiment. See Eloy Dict. Hift. Haller. Bibl. Med.

Libavius, Liquor of. See Liquor.
LIBEL, Famofus Libellus, a writing or report, unlawfully publifhed abroad, containing injurious reproaches, or accufazions, againit the honour and reputation of any perfon, par.
ticularly of a faperior or governor: or, it is defined to be a malicious defamation of any perfon, expreffed cither in printing or writing, figns or pictures, to afperfe the reputation of one that is alive, or the memory of one that is dead. According to judge Blackltone, libels, in their moft extenfive fenfe, fignify any writings, pictures, or the like, of an immoral or illegal tendency. Confidered particularly as offences againtt the public peace, they are malicious defamations of any perfon, and efpecially a magiftrate, made public by either printing, writing, figns, or pictures in order to provoke him to wrath, or expofe him to public hatred, contempt, or ridicule.

Platina is of opinion, that a writing, how injurious foever it is, cannot be called a libel, if the author's name be to it. Libellers, among the ancient Romans, were punifhed with death, but in after-times they were only whipped. Auguftus ranked fanofos libellos, defamatory libels, among the crimes lafa majeflatis, of high treafon; and under the emperor Valentinian it was made capital, not only to write, but to publifh or even omit deltroying them. F. Baldwin has publithed a comment on the imperial laws againtt libels. Scandalous pictures are reckoned amongit libels.

A libel, the lawyers fay, may be either in friptis, or fine feriftis : in feriptis, when a writing is compoled, or publifhed to another's difgrace; which may be done either verbis aut contalenis; as where this is malicioufly repeated, or fung, in the prefence of others: or elfe traditione, when the libel, or any copy of it, is delivered out, to fcandalize the party. 3 Inft. 174 .

A libel fine feriptis, may be twofold. I. Pifuris, as to paint the party in a Chameful or ignominious manner : or, 2. Signis, as to fix a gallows, or other ignominious figns, at the door of the party', or elfewhere.

Where a writing inveighs againt mankind in general, or againft a particular order of men, this is no libel ; in order to make it a libel, it mult defcend to particulars and individuals. (3 Salk. 224.) But a general reflection on the government is a libel, though no particnlar perion is reflected on; and the writing againft a known lav is held to be criminal. (4 St. Tr. $672,903$. ) According to C. J. Holt, fcandalous matter is not neceffary to make a libel; it is enough if the defendant induces an ill opinion to be had of the plaintiff, \&c: And if a man peak fcandalous words, unlefs they are put in writing, he is not guilty of a libel; for the nature of a libel confits in putting the infamous matter into writing. ( 2 Salk. 43 \%. 3 Salk. 226.) A defamatory writing, expreffing only one or two letters of a name, in fuch a manner, that from what goes before and follows after it may be underftood, by the natural conftruction of the whole, to fignify and point at fuch a particular perfon, is as properly a libel as if the whole name were expreffed at large. (1 Hawk. P. C. c. 73. f. 4.) On application for information againft this offence, fome friend to the party complaining fhould in fuch cafe ftate by affidavit his having read the libel, and that he undertands and believes it to mean the party. ( 3 Bac. Abr. 12.) And in the cafe of actions for libels by ligns or pictures, it feems neceffary always to fhew, by proper innuendoes and averments of the defendant's meaning, the import and application of the fcandal, and that fome fpecial damage has followed; otherwife it cannot appear that fuch libel by picture was underftood to be levelled at the plaintiff, or that it was attended with any actionable confequences. (131. Com. iii. c. 8.) Although a private perfon or magiftrate be dead at the time of making the libel, yet it is punifhab!e, as it tends to a breach of the peace. (Hob. 215.5 Co. 125: 1 Hawk. P. C. c. 73.) But an indictment for publifhing libellous

## LIBEL.

matter reflecting on the memory of a dead perfon, not alleging that it was done with a defign to bring contempt on the fanily of the deceafed, and to itir up the hatred of the king's fubjects againtt them, and to excite his relations to a breach of the peace, cannot be fupported; and judgment was in this cafe accordingly arrefted. (4 Term Rep. 12G.) No writing is eftecmed a libel, unlefs it reflect upon fome particular perfon. And a writing full of obfcene ribaldry is not punifhable by any profecution at common law; but the author may be bound to good behaviour, as a perfon of evil fame. (I Hawk. P. C. c. 73.). Priating or writing may be libellous, though the fcandal is not directly charged, but obliquely and farcaftically. Id.

It is certain that he who compofes a libel, or procures another to compofe it, and alfo he who publifhes or procures another to publifh it, is in danger of being punifhed for it; and it is faid not to be material, whether he who difperfes a libel know any thing of the contents or effect of it, or not ; for nothing would be more eafy than to publifl the moft virulent papers with the greateft fecurity, if concealing the purport of them from an illiterate publifher would make him fafe in difperfing them. (x Hawk. c. 7o.) It hath alfo been faid, that if he who hath either read a libel himifelf, or hath heard it read by another, do afterwards malicioully read or repeat any part of it in the prefence of others, or lend or fhew it to another, he is guilty of an unlawful publication of it. (Id.) It hath alfo been holden, that the copying of a libel fhall be a conclufive evidence of the publication of it, unlefs the party can prove that he delivered it to a magittrate to examine it. (Id.) When any one finds a libel, if it be againft a private perfon, he ought to burn it, or deliver it to a magiftrate; and where it concerns a magittrate, he fhould deliver it prefently to a magitrate. ( 5 Rep. 125.) If a libel be found in a houfe, the mafter cannot be punifhed for framing, printing, and publifhing it; but it is faid he may be indicted for having it, and not delivering it to a magiftrate (I Vent. 31.) ; or it may, in fome cafes, be confidered as evidence of his being the author or publifher. ( 2 Salk. 418.) It hath been ruled, that the finding of a libel on a bookfeller's fhelf is a publication of it by the bookfeller, and that it is no excufe to fay, that the fervant took it into the fhop without the matter's kuowledge; for the law prefumes the mafter to be acquainted with what the fervant does. (i Seff. C. 33. R. v. Dodd. 10 G .) The fale of the libel by a fervant in a thop is prima facie evidence of publication, in a profecution againt the matter; and is fufficient for conviction, unlefs contradicted by contrary evidence, fhewing that he was not privy, nor in any way affentiug to it. 4 Term Rep. 126. 5 Burr. 2686, 70 I Hawk. P. C. c. 73.

It is faid to be immaterial, on a criminal profecution, with refpect to the effence of a libel, whether the matter of it be true or falfe, or whether the party againft whom it is made be of good or bad farne; for in a fettled flate of government, the party grieved ought to complain for any injury done to him, in the ordinary courfe of law, and not by any means to revenge himfelf either by the odious courfe of libelling or otherwife. ( 5 Co .125 .) But this is to be underflood, when the profecution is by information or indictment; but in an action on the cafe, which is to repair the party in damages, the defendant may juftify the truth of the facts, and thew that the plaintiff hath received no injury. Although it has been held, agreeably to the doctrine main. tained by lord chief juftice Mansfield, for at leaft two cen. turies, that the truth of a libel is no juflification in a criminal profecution, yet in many inftances it is confidered as an estenuation of the offence; and the court of king's bench
has laid down this general rule, viz. that it will not grant an information for a libel, unlefs the profecutor who appli-s for it makes an affidavit, afferting directly and pointedly that he is imnocent of the charge imputed to him. This rule, however, may be difpenfeel with in particular cafes; as if the perfon libelled refides abroad, or if the imputations of a libel are general and indelinite, or if it is a charge againft the profecutor for language which he has held in parliament. Where, on application for an information, the truth of the libel is not denied, the court, except in the inflances above mentioned, will leave the injury to be remedied in the ordinary courfe of juftice by action or indictment. (Stra. 493.) But the court will not grant this extraordinary remedy by
information, nor fhould a grand jury find an indictment information, nor fhould a grand jury find an indictment, unlefs the offence be of fuch fignal enormity, that it be reafonably confrued to have a tendency to difturb the peace and harmony of the community. (1 Hawk. P. C. c. 73 .) There are authorities, that truth is not a juftification even in an action for a libel; and a very learned writer feems to doubt whether fuch a plea would now be admitted by the court, if the accufation in the libel did not amount to an in. dictable offence. (3 Woodd. 182.). It feems, however, that the contrary is the prevalent opinion; and that in every action for a libel, if fpecific inftances can be ftated upon the record, fo as to fupport the general charge of the libel, the courts would determine them to be a fufficient juftification of the defendant. I Term Rep. 748.

The punifhment of libellers for either making, repeating, printing, or publifhing the libel, is fine, and fuch corporal punihment (as imprifonment, pillory, \&c.) as the court in its difcretion fhall inflict; regarding the quantity of the offence, and the quality of the offender. (I Hawk. P. C. c. 73.) If a printer print a libel againt a private perfon, and much more againft a magiftrate, or againft the king and Itate, he may be indicied and punifhed for it; nor is it any apology to fay, that it was done in the way of trade, or to mainrain a family, (I St. Tr. 982. 986.) Alfo, if book-
fellers, \&c. publith or f.ll fellers, \&c. publith or fell libels, though they know not the contents of them, they are puniifable. It has been refolved, that where perfons write, print, or fell any pamphlits, fcandalizing the public, or any private perfons, fuch libellous books may be feized, and the perfons punifhed by law ; and all perfons expoling books to fale, reffecting on the government, may be punifhed; alfo, writers of news (though not fcandalous, feditious, or reflecting on the government, if they write falfe news) are indictable. St. Tr. 477.

With regard to libels in general, there are two remedies; one by indictment and another by action. The former for the public offence; for every libel has a tendency to break the peace, or to provoke others to break it; which offence is the fame, in point of law, whether the matter contained be true or falfe; and, therefure, the defendant on an indictment for publifhing a libel, is not allowed to allege the truth of it by way of juftification. In fuch profecutions the only facts to be confidered are, firt, the making or publifhing of the book or writing; and fecondly, whether the matter be criminal. But in the remedy by action on the cafe, which is to repair the party in damages for the injury done him, the defendant may, as for words fpoken, jultify the truth of the facts, and fhew that the plaintiff has received no injury at all. Blackt. Com. vol. iii. and vol. iv.

In information and lawy proceedings, there are two modes of defribing a libel; wiz. by the fenfe, and by the words; the firlt is "cujus tenor fequitur," and the fecond "qua fequitur in hxe Anglicana verba, \&c.". in which the

## I. IB

ecereription is by particular words, and of which every word is a mark, fo that if there is any variance, it is fatal; in the other defeription by the fenfe; it is not material to be very exact in the words, becaufe the matter is defcribed by the fenfe of them. (2 Salk. 660.) It hath been adjudged, that libels, as having a direct and inmediate tendency to a breach of the peace, are indicable before juftices of the peace. (1 Hawk. c. 8.) A libel murt be proved to be written or publifhed in the county laid in the indictment; all matters of crime being local. An information for a libel need not charge the offence to have been committed " vi et armis," or allege that the libellous matter is falfe. ( 7 T. R. 4.) The declaration for a libel mult lay it to be " of and concerning the plaintiff;" otherwife there can be no judgment. (a Strange, 934.) A very important fubject of litigation has arifen from profecutions for libels, and particularly for tlate libels; and that is, whether juries are, or are not, judges of laze as well as of fac. With regard to libels, it had for a long time been the ufage for the judge to direct the jury, that if the fact of the publication of the paper charged to be a libel was proved, and if they believed the innuendoes in the indictinent, they muft find the defendant guilty; without adverting to any other circumftances, fuch as whether the paper were, in their opinion, a libel, or publifhed with a malicious, feditious, traiterous, \&c. intention. The counfel for the defendants in fuch profecutions always maintained, that it was the province of the jury to judge whether the paper was a libel (a queftion of mere law); and allo whether it were publifled with a malicious, feditious, \&cc. intention, as charged,--a complicated queflion of law and fact. Mr. (now lord) Erkine was the nofl flrenuous affertor of this latter doctrine; and by the indefatigable exertions of him and the late Hon. Charles Fox, the following act of parliament was obtained with a view exprefsly of fettling this queltion by legiflative authority ; and in confequence of it a great, and, as many have deemed it, a very favourable, alteration has taken place in the trials for libels. The ftatute is that of 32 Geo. III. c. 67. After reciting that doubts had arifen whether on the trial of an indictment or information for making or publifhing a libel, where an iffue is joined on the plea of not guilty, it were competent to the jury to give their verdict upon the whole mater in iffue, it enacts that on every fuch trial the jury may give a general verdict of guilty or not guilty apon the whele matter; and fall not be required or directed by the court or judge, before whom ruch indictment or information fhall be tried, to find the defendant guilty merely on the proof of the publication by fuch defendant of the paper charged to be a libel, and of the fenfe afcribed to the fame in fuch indictunent or information. (f. 1.) Provided always, that on every fuch trial the court or judge before whom fuch indictment or information fhall be tried, fhall, according to their or his difcretion, give their or his opinion and directions to the jury on the matter in iflue Detween the king and the defendants, in like manner as in other criminal cafes. (f. 2.) Provided alfo, that nothing herein contained fhall extend, to prevent the jury from finding a fpecial verdict, in their difcretion, as in other criminal cafes. ( f . i.) Provided alfo, that in cafe the jury fhall find the defendant guilty, it fhall and may be lawful for him to move in arreft of judgment on fuch ground, and in fuch man. ner, 3s by law he might have done before the paffing of this act.

When a perfon is brought before the court to receive judgment for a libel, his conduct, fubfequent to his conviction, may be taken into confideration, either by way of aggravation or mitigation of his puniftment. ( 3 Term Rep. 432.)

Judge Blackflone obferves, that in all the inflanees where blafphemous, immoral, treafonable, fchifmatical, feditious, or fcandalous libels are punifhed by the Englift law, furne with a greater, and others with a lefs degree of feverity, the liberty of the prefs, properly underitood, is by no means infringed or violated. See Liblerty of the Paess.
Libec, or libellus, a little book, in the fpiritual court fignifies the original declaration of any action in the civil law. (Stat. 2 Edw. VI. c. 53.) 'The libel ufed in ecclefaltical procecdings confifts of three parts. I. The major propofition, which thews a jult caufe of the petition. 2. The narration, or minor propofition. 3. The cosclution, or conclufive petition, which conjoins both propolitions. Blackit. Com. vol. iii.

Libel, in the Laz of Scotland, is ufed for a criminal acculation or indictment.
libella, in Natural Hiffory. See Libellula.
Librlla, among the Romans, was the tenth part of the denarius.

LIBELLATICI, an ancient kind of apoftates from Chriftianity, under the perfecution of Decius; who, to prevent their being obliged to renounce the faith, and farrifice to idols in public, made application to the magiitrates, and abjured their faith in private ; obtaining certificates of them, either by intreaty, or by money; by which they were attefted to have complied with the orders of the emperor; and were thereby fheltered from any farther moleftation on account of their religion.

Thefe certificates were called libelli; whence the people who obtained them came to be denominated Libellatici.

Others, particularly the centuriators of Madgebourg, are of opinion, that the Libellatici were only fuch as furnifhed the magiftrates with money, to fcreen them from profecution, and from being obliged to renounce Chriftianity.
M. Tillemont retains fumething of each opinion ; he thinks, the Labellatici, applying themfelves to the magiltrates, bought off the facrificing and abjuration; and obtained letters, by which they were declared to have renounced Chritt, and facrificed to idols; though, in effect, they had done neither.

LIBELLU1.A, or Dragon Fly, in Entomology, a genus of the order Neuropteræ; the claracter of which, according to Gmelin, reduced to the arrangement of the "Syttema Naturx,'" confifts in the mouth armed with jaws, more than two in number; lip trifid; antennx wery thin, filiform, and fhorter than the thorax; wings expanded; tail (of the male infect) furnifhed with a forked procels.

In this genus the antennæ are very fhort, being merely a pair of fmall hairs, the wings large and fpreading, and the body lengthened. The libelu're, or dragen-flies, exhibit an inftance fcarcely lefs friking than the butterfly of that diffimilitude in point of form under which one and the fane animal is deftined to appear in different periods of its exiftence. Perfons not converfant with natural hifory, would fcarcely believe that thefe brilliant infects, flying with vaft ftrength and rapidity, and purfuing other infects still fmaller, after the manner and with the velocity of a hawk, had been inlabitants of the water, in which they relided a confiderable time before they had affumed the flying form. The whole tribe, which is divided into fections, and one of which fections is fubdivided, is exceedingly ravenous, and generally feen hovering over ftagnant waters: the larvx are fix-footed, active inhabitants of the water, furnifhed with an articulate forcipated mouth; and prey with the atmoft rapacioufnefs upon aquatic infects and the larvx of others; the pupa refembles the larva, but, in the former itate, it has the rudiments of wings. 'I'be libellula, or dragon-fies, are fome-
times, though very improperly, called horfe-fingers. There are nearly fixty fpecies: before, however, we come to the e.numeration of thefe, we may relate fome facts common to the tribe itfelf. The addeeffes of the male libeliula to his female feem carried on in a rough but very efficacious manner. He hovers about on the wing, till the object of his smours makes her appearance; he then watches an opportunity of feizing her by the head with thofe pincers with which his tail is armed. In this manuer he travels through the air, till the female, yielding either to fuperior itrength or inclination, forms her body into a kind of circle, adapted to the purpefe of nature ; hence the libellule are frequently feen coupled in the air, exhibiting the form of a ring. The female, at a proper period, retires to fome ftagnant water, where, by the afliftance of a ftick or reed, the mers herfelf down, by moving backwards, till the tip of the tail is immerged a little in the water; the is then feized with a tremor of the body, during which the depofits the egg in the water. In this way the operation is repeated. The tail is withdrawn from the water, by contracting the annuli; and, by the preffure of thefe upon each other, the egg is gradually forced from the ovary to the extremity of the tail ; whence it is feparated by thaking that part in the water. The eggs are of a white colour, refembling thofe produced by the common blow-Ay. The larve are difguiting in appearance, but beneath the head is placed an inttrument excellently adapted for feizing and holding their prey. It is furnithed with a forceps at the end, and can be advanced or drawn back with the agility of the human hand! The larva remains in the fame ltate about a year before it attains its full fize : when the period of its transformation has arrived, it repairs to the margin of the pond in queft of a convenient litaation during the feafon of its inaction. It there attaches itfelf to a plant or piece of dry wood, and the fkin, which has gradually become parched and brittle, at length fplits oppofite the upper part of the thorax. Through this aperture the winged infect quickly pufhes its way, and being thus extricated from confinement, begins to expzod its wings, te flutter, and finally to launch into the air. The complete infect, in its winged flate, continues to purfue food fimilar to that by which it had been fupported before, and remains infectivorous. The lepidopterous infects, the butterflies, and phalxnx, are deftined for the fupport of the larger libeliulx, which are a part of thofe nume. rous tribes appointed to conline thefe prolific genera within due bounds. The life of the libellula, in its winged itate, is fhort in comparifon with that which it pafted in its aquatic form, the frolts of the early autum deftroying all thofe that have not been devoured by birds in the preceding months. It is impoffible not to be ftruck with wonder in contemplating the changes of the libellula, which, while living in the water, would perifh by a long expofure to the air, while the winged infect, having efcaped from the pupa, would be deftroyed by fubmerfion under the water, of which, not an hour before, it was the legitimate inhabitant.

The fpecies are divided into the fections A and B. Section A. Wings expanded when at relt. The infects of this divifion are fubdivided into $\alpha$ Dorfal divifion of the lip very minute; and 6 Divifions of the lip equal ; conftituting the tribe Efhna of Fabricius. B. Wings erect when at refl ; eyes diflinct ; outer divifions of the lip bifid. The tribe Agrion of Fabricius.

## Species.

Seaion A. Wings cripanded when at reft: a Dorfaldivifon of the lip very minutto.

Vol. XX.

4-Maculata. Lower wings at the lafe, and all in the middle on the fore-part with a blackifh fpot; abdomen depreffed, downy. It is an European infect, and defcribed by Reaumur.
Depressa. All the wings blackifh at the bafe; abdomen deprefled, yellowifh at the fides. This alfo is an European infect; figures and defeription are given by Edwards and Donovan. The maic is of a bright iky-blue, with the frides of the body yellow; the female of a fine brown, with yellowith fides. The wings in both fexes are anfparent, except at the fhoulders, where they are each marked by a broad bed of brown with a ftripe of yellow; the tips of each wing have alfo a fmall oblong-fquare black foot on the outer margin. The larva is of a greyifi-brown.
Trimaculata. All the wings hyaline, with a ferruginous fpot at the bafe, and band in the middle. It inhabits Carolina.

Bifasciata. Wings hyaline, with a brown fpot at the bafe and two bands. It inhabits America. The thorax is villous-brown, with two yellow lines under the wings; abdomen depreffed, brown, the fides jellowifh.

4-Punctata. Wings white; lower ones black at the bafe with a yellow line; all with a black dot; abdomen cylindrical. It inhabits America. Thorax is of a downy green; front veficular green; abdomen greenifh at the bafe, but towards the tip blackifh; all the wings with a black dot in the middle at the rib, and an oblong ftigma at the tip.
Flaveola. Wings pale yellow at the bafe. Inhabits Europe. Its wing 3 are fometimes without the yellow fpot.

Liseata. Wings white with a yellowifh bafe, and black band and tip; abdomen yellow, with a lateral black line. This fpecies is found in India. Its head and thorax are yellow; abdomen compreffed.

Stigmatizins. This is a yellowifh infect; has wings with a brown fpot, the tip brown with a fnowy fligma. It is found in New Holland. Sir Jofeph Banks has a fpecimen in his mufeum. The abdomen is marked with black lines; wings hyaline.

Oculata. Like the laf, this is of a ye.lowifh colour ; the upper wings are hyaline at the tip, lower ones at the margin, with a fnowy ftigma. It inhabits New Holland.
[xdica. This fpecies has wings varied with yellow and brown, and white at the tip; the lower ones have a blue fpot at the bafe. It is found, as its name imports, in India. 'I'he body is brown ; tip of the wings hyaline.

Muncia. Bronzed; wings are of a whitifl colour fpotted with brown; the lower ones yellow at the bafe. Inhabits India.

Vesicula. Wings white; takes its name from an elevated veficular front, and thorax yellow immaculate. Is found in America, and is a large infect; the abdomen is cylindrical, the fegments pale at the bafe and black at the tip ; tail with cylindrical feales.

Rubicunda. Lower wings only blackifh at the bafe; body fquare. An inhabitant of Europe. In one fex the back is fpotted with red, in the other with yellow.

Vulgatissima. Thorax yellow, with eight black ftreaks. It inhabits Europe.

Obscura. All its wings are ferruginous; the body of a dufky hue; an American infect; the abdomen is cylindrical; wings with an oblong brown marginal dot.

Vulgata. Wings hyaline immaculate; abdomen cylin. drical and reddifh. Inhabits Europe.

Siberica. Wings hyaline, with a tranfverfe broad fero
40
ruginous
ruginous band towards the tip; body reddifh. Inhabits Siberia.
sineata. The wings of this infect are flat, longitudinally finuate, and black on the thicker margin, with a white fligma. The body is blueifh. There is a fpecimen in the Britilh Mufeum.

Cancetata. Wings immaculate at the bafe; back and files of the abdomen interrupted by yellow. . It inhabits Europe.

Premontance. Found among the mountainous parts of Italy; wings flat, cinereous, with a brown band at the tip. It is finall, and the body of an obfcure yellowifh.

Fisclata. Wiags flat, brown, with a white !treak. It inhabits India.
twrbata. Found in America. Wings flat, with a brown band.

Scrra. Wings flat, white, with an oblong black fpot at the bafe and band in the middle. It inhabits China. The body is cylindrical.

Notata. The wings of this are flat, with white fpots and tip. It inhabits Africa. A fpecimen is in the mufeum of fir Jofeph Banks.

Dimidrata. Wings flat and black from the bafe to the middle. It is found in America.

Equestris. TVings half black, with a fiowy band in the middle. It inhabits Africa. A fpecimen in the mufeum of fir Tofeph Banks. The head is hrown, with a yellow dorfal line; all the wings are black from the bafe to the middle, then a fnowy band; the tip hyaline with a common brown fpot.

Fiuctuass. Wings black tipt with white. It inhabits India, is fimall, and brown; the front is veficular yellowith.
Nebulosa. Wings white tipt with black. It inhabits India; the body is black; mouth yellow; fides of the thorax and abdomen fpotted with yellow; tail with yellow appendages.

Cminessis. The upper wings faint teflaceous; lower ones green tipt with brown. It inhabits China.

Vliksicolor. Wings flat, white with three black and three cinereous fpots. It inhabits America. A fpecimen is in the mufeum of Dr. Hunter. The head is brown, fpotted with yellow ; thorax brown, with two yellow lines each fide under the wings; the abdomen is brown.

Vibraxe. Wings flat, white with a black Spot in the middle, the tips ferrnginous.

Americasa. PNotwithitanding the name, this fpecics is found in India. Wings purplith, with a white band; upper pair tipt with white, lower ones with a white line at the bafe.

Margmata. Wings black; upper pair with a white fpot at the tip; lower ones edged with white. It inhabits Africa; may be feen in fir J. Banks's mufeum. The front is blue; eyes brown, dotted with yeliow; thorax black; abdomen brown, whitifh at the bafe."

Flaricumed. Wings white, yellow at the bafe; body sed. It inhabits China.

Tomertos.. The wings of the infeets of this fpecies are alfo white; but the body is downy variegated with brown and green. It is found in Anerica. The front is blue; abdomen cylindrical black, the fegments witly a greenith dot on each fide.

压nea. Wings hyaline; thorax green bronzed. It inhabts Europe.

Cravea. Wings white, with a fnowy fpot terminated by a brown one. The body is blue. It inhabits AmeH14.

6-Maculata. Wings with three black collal fpots, the latt with a fnowy Itigma; lower ones with yellowifh bands. It inhabits China. The head is yellowifh; thorax yellowifh with black lincs; abdomen fat and yellowifh with black lines.

Coxtamisata. Yellowifh; wings whitih, with a ycllowith fhade in the middle. It inhabits India. The head, thorax, and abdomen yellowifh.

Eponixa. Wings yellowifh, with about three black bands. Is found in Carolina. Head and thorax yellowifh; abdomen cylindrical, with a yellowifh dorfal and lateral line; all the wings have a white coltal fpot near the tip.

Vama, or great variegated libellula, the molt remarkable Englifh fpecies, makes its appearance towards the decline of fummer, and is an animal of fingular beauty; it is three inches long, and the wings, when expanded, meafure about four inches from tip to tip. Wings varied with yellow and brown, the tip. with a white foot terminated by a black one. The head is very large, and affixed to the thorax by an extremely flender neck; the eyes occupy by far the greatelt part of the bead, and are of a pearly blue-grey calt, with a varying luftre; the front is greenifh-yellow; the body is long, flender, and black, with, rich variegations of bright blue, and deep grafs-green. The wings are perfectly tranfparent, itrengthened by numerous black reticular fibres, and exhibit a Atrongly iridefcent appearance, according to the different inflections of light. This infeet, in its motions, is extremely rapid, fying abcut in purfuit of it3 prey during the midale of the day, and is at this time taken with extreme difficulty, darting off on the flightelt alarm from the fpot on which it fettled, and in the face of a fecond or two flying to a great diftance. During the early hours of the morning, and the late ones in the evening, it is eafily taken; at fuch times it is obferved to fit with its wings expanded, but in fo inert a ttate, that it will fuffer itfelf to be readily feized by one of its wings, without attempting to move from its place.
Juscea. Wings with a blackifh acceffory membrane; thorax with fix yellow lines; abdomen tapering towards the bafe. Inhabits Europe.

Cabolina. Wings whitif; lower ones indented ferruginons at the bafe; thorax brown. An inhabitant of. America.
Capersis. In this fpecies the whitifl wings are every where fpotted and dotted with brown ; it is found, as its. name imports, at the Cape of Good Hope.
Trucolora. Wings variegated with brown, blueifh, and yellow, the tip hyaline. An inhabitant of India.

Rubra. Is fo named from its reddifh colour ; the wings with a ferruginous bafe and marginal lines. It inhabits Europe.

## 6 Divifions of the Lip equal.

Forcifata. This infect, like the varia, is very large, and expands full four inches aud a half. Nofe yellow, with a black line on the prominent part; thorax black, with feveral broad yellow fripes, two on the frant, and two behind the ligaments of each pair of wings; abdomen blavk, with two itreaks refembling a crefcent on each fegment; wings tranfparent and white, with a tinge of amber; tail with three incurved claws.

Grunds is the largeft of this genus found in Britain, and is...erhaps, net juferior in bulk to any infect which this cu: iy produces; the fore-part of the head is yellow : the eyes brown, and fo large, that they meet at the top of the head. The thorax is of a dun colour, with four ob. lique bands. on each fide of a lemon coloura. The abdomen
is reddifh, often fpotted with white and black upon the top and bottom of each fegment; the fmall appendices which terminate the abdomen are very long; the wings have more or lefs of a yellow complexion, and are diftinguifhed by a brown fpot on the exterior edges. The colours of the infeet vanifl when dead.

Varnegata. Thorax with two yellow lines on each Gide: wings with a white foot at the bafe. It inhabits T'erra del Fuego. A fpecimen is in the mufeum of fir Jofeph Banks. The body is brown; mouth yellowifh, with a black dot at the bafe; the abdomen is round and ferruginous, the fegments are edged with black, and in each a white fpot divided by a black line.

Clayata, has a clavate abdomen, which is gibbous at the bafe, variegated with brown and green. It inhabits China. The head is veficnlar green; thorax green with black lines; abdomen green with black ttreaks, the middle thinner and black with lateral yellow fpots, the tip thickened black with a white tail.

Minuta. Abdomen yellow, with two black lines; dower wings yellow with two black fpots. It is an inhabitant of China. The head is yellow, eycs brown ; thorax with yellow lines beneath; abdomen with two black lines above and beneath ; upper wings black at the bafe with a yellow fpot.
B. Wings erect zwhen at reft; eyes difinct; outer divifions of the lip bifid.

Virco. This is one of the molt elegant of the European infects, but is fmaller than the varia or grandis, and is diftinguifhed by its flender, long, cylindric body, which, as well as the head and thorax, is ufually either of a bright but deep golden-green, or elfe of a deep gilded blue; the wings are tranlparent at the bafe and tips, but are each marked in the middle by a very large oval patch of dark violet blue, accompanied with iridefcent hues, according to the direction of the light; fometimes the wings are entirely violetblack, without the leaft appearance of tranfparency either at the bafe or the tips, and fometimes they are altogether tranfparent, without any appearance of the violet-black patch which diftinguifhed moft of the individuals: laftly, the infect fometimes appears with tranfparent wings, but fhaded with a ftrong caft of gilded greenifh-brown, each being marked by a fmall white fpeck at the exterior edge near the tips. The genus is divided into varieties, viz. a. Body fhining green-blue; wings. blueifh in the middle, the bafe and tip whitifh, the margin immaculate. Donovan. b. Body filky; wings blueifh-green, the tip brown, the margin immaculate. Reaumur. c. Body filky-green ; wings brownith with a white marginal dot. d. Body fllky; wings brown-gilt with a black foot. It inhabits Europe, and is common about waters.

Puella. Wings hyaline, not coloured. This is a much fmaller fpecies than the virgo. It varies in colour, but is generally of a bright and beautiful 0 ky -blue, variegated with black bars on the joints, and with the thorax marked by longitudinal itripes; the wings are tranfparent, and each marked near the tip with a fmall, oblong, fquare, black, markinal fpot: the head in this fpecies is broader and narrower in proportion than that of the $L$. varia, and the eyes are round, protuberant, and placed on each fide at a diftance from one another. From the brilliancy and richnefs of its colours, it has been called the king's-fifher; it frequents little rivulets of water oyerhaded with bufhes. 'There are Several varieties of this fpecies, taken from the difference of fpots and colours: as a. Body red with yellow and black lines at each fegment; thorax green with yellow lines; wings with marginal fpots. This is given by Mr. Donovan.
6. Body feft colour; wings with a brown marginal dot. c. Body alternately blue and cinereous; wings with a black dot. d. Body beneath blue-green, above brown; thorax with alternate brown and blucilih bands; wings with a black matginal dot. e. Body green with a flefh-colour bluhn; thorax with three black lines; wings with a brown marginal dot. It inhabits Europe, in almoft endlefs varicties.
Ciliata. Green bronzed; abdomen brown; legs fringed black. Inhabits Coromandel. A fpecimen is in iir Jofeph Banks's mufeum. Head and thorax bronzed; abdomen cylindrical.

Nobilitata. Upper wings dulky; lower ones filky green tipt with black. Is found in South America. Body
gloffy green; lower wings beneath black. gloffy green; lower wings beneath black.
Lixearis. Wings with a yellowifh or black figma; abdomen extremely flrong. Is found in India, and is figured by Drury; who, according to Dr. Shaw, has given a beautiful figure of a fpecies not mentioned by Gmeln, viz. the

Lucretia, which is a native of the Cape of Good Hope, and is dittinguifted by the length of its flender body, which is about five and a half inches long, though fcarcely the tenth of an inch in diameter. The wings of this fpecies are tranfparent, flender, and narrow; they meafure from tip to tip five and a half inches. The colour of the head and thorax is brown, with a yellowifh fripe on each fide, and the body is of a deep mazarine blue.

Having defcribed the feveral fpecies of the libellula, we flall clofe our account of this interefting genus of infeets with fome account of the eyes, as defcribed in Adams' Effays. Thefe are finely adapted for microfcopical examination; and by the affiftance of a good inftrument, it will be feen that the eye is divided into a number of hexagonal cells, each of which forms a complete eyc. The external parts of thefe eyes are fo perfectly fmooth, and fo well polifhed, that when viewed as opaque objects they will, like fo many mirrors, reflect the images of all furrounding objects. The figure of a candle may be feen on their furface multiplied almoft indefinitely, fhifting its beam to each eye according to the motion given to it by the hands of the obferver. Leeuwenhoeck fays, there are twelve ,thoufand five hundred and forty-four lenfes on each eye of the libellula. If one of the protuberant fubitances be nicely taken from the head of the infect, wahhed clean, and placed before the miciofcope, its flructure is elegantly feen, and it becomes an object worthy of the highelt admiration. Each of the eyes is an hexagon, and has the fame effect as a convex lens in forming the image of an object placed before it, as may be feen by turning the mirror of the microfcope fo as to bring the picture of fome well-defined object under the eye. If turned to a fingle houfe, in the eye of the infect the houfe -is diminifhed very much, but it is multiplied into a city ; if turned to a foldier, there will be feen an army of pigmies performing every motion at the fame inftant of time; if turned towards a candle, there will be a beautiful and refplendent blaze from multitudes of regular flames. See Adams' Eflays, 4to. p. 195 - 6 .
LIBEN, in Geography, a town of Bohemia, in the circle. of Leitmeritz; in miles No of Leitmeritz.
LIBER, in Vegetable Anatomy, 'an ancient Latin word for the thin inner bark or rind of a tree, which being ufed to write upon before the invention of parchment or paper, is Gpppofed to have given its name to a book. For the nature and functions of the liber, fee Babs and Cortex.

Liber Niger, domus Regis, is the title of a book in which there is an account of the houfehold eltablifhment of king Edward IV., and of the feveral muficians retained in his
fervicea

Service, as well for his private amufement, as for the fervice of his chapel. See King's Band, Hocsimoli, and Cuapel Eflabliflument. See alto, N 293 of the Harl. MSS. Brit. Muf. and N' 1 147, 2, 3, 11, of the A flmol. Collect. Oxf. for "ordinances touching the king's houfchold," made in the time of Edward II. as well as in that of Edward IV. And in the Liber Niyer publifhed by Batnaan, with additions.
LIBERA, in Mythologn, the name of a goddefs, which Ciccro, in his book of the Gods, reprefents as the daughter of Jupiter and Ceres. Ovid in his Fafti fays, that the narne was given by Bacchus to Ariadne.

Libera is exhbited on medals, as a kind of female Bacchus, crowned with vine-lcaves.

Libera, in Law, a livery or delivery of fo much corn or grafs to a cuitomary tenant who cut down or prepared the faid grafs or corn, and received fonce part or fmall pertion of it as a reward or gratuity. Covel!.

Libera Cbafra bukenda, a judicial writ granted to a perfon for a free chafe belonging to his manor, after proof made by inquiry of a jury, that the fame of right belougs to him. Reg. Orig. $3^{6} 6$.

Libera Pifcaria, a free fifhery, which being granted to a perfon, gives him a property in the fifh, \&c. ( 2 Salk. 637.) See Fisimerx.

Liberal Arts, are fuch as depend more on the labour of the mind than on that of the hand; or, that confitt more in feculation than operation; and have a greater regard to amufement and curiofity than to neceffiry.

The word comes from the Latin lib:ralis; which, among the Romans, fignified a perfon who was not a flave; and whofe will, of confequence, was not checked by the command of any malter. See Arts.

LIBERALE Verosese, in Biography. By this name Vafari fpeaks of an hiftorical painter, born at Verona in 1451. He was at firit a difciple of Vincenzo di Stefano; but afterwards he imitated the fyle and manner of Bellini of Venice, whom, while a youth, he faw painting in the chapel of St. Nicolo at Verona.

He began to paint very early in life, and filled the churches and convents of his native city with highly wronght pistures, which were very much efteemed; and of which the author abore-mentioned fpeaks with high encomiums.

His ftyle appears by his account to be of the early dry manner in art. Compofitions confilting of a number of figures, all finifhed with great minutencis; and frequen:ly of fmall proportions.

LIBERALIA, feafts celebrated by the ancient Romans, in honour of Liber, or Bacchus, the fame with thofe which ebe Greeks called Diosty fir, and Dionyfiaca.

They took their name frnm libcr, i.e. free, a title conferred on Bacchus, in memory of the liberty or freedom which he granted to the people of Brotia; or, ferhaps, becaufe wine, whereof he was the reputed deity, delivers men from care, and fets their minds at eafe and freedom. Varro derives the name of this feaft from liker, confidered as a noun adjective, and fignifying free; becaufe the priefts were free from their furction, and eafed of all care, during the time of the liberalia, as the old women officiated in the ceremonies and facrifices of thefe feafts.

Liberam Legen. See Lex.
LIBERAN, in Grography, a fmall inand of the Eaf Indian fea, near the N.E. coatt of the ifland of Borneo, on which are many deer. N. lat. $6^{\circ} 2^{\prime}$. E. long. $116^{\circ} 8^{\prime}$.

Liberandis Terris. See Terris.
LIBERATE, in Lase, a writ that lies for the payment of a yearly penfion, or fum of money, granted under the
great feal, and directed to the treafurer, chamberlains, and barons of the exchequer, \&ec. for that purpofe.

In another feafe it is a writ to the fheriff of a county, for the delivery of poffeffion of lands, and goods extended, or taken upon the forfeiture of a recoznizance.

Liberate is allo ufed for a writ iffuing out of the chancery, directed to a gaoler for delivery of a prifoner, who hath put in ball for his appearance. I. N. B. 132 G Inlt 116.

LIBERATI, Astmo, in Biography, a finger in the pontifical chapel at Rome in the $17^{7}$ h century. When a youth, he was a choiritter in the chapel of the emperor Ferdinand 1II., and his brother Leopold, previous to his admiflion into the pope's chapel: where, befides his vocal abilities, he diltinguifhed himfelf as a compofer. He was, likewife, organitt della fantiffina Trinita di Pellegrini, and maeftro di cappella, and organilt of the church di Santa Maria dell' anima della natione Teutonica at Rome. In this quality he wrote a letter, which is often quoted, particularly by Adani, in his Offervazioni per ben reg. il coco de i Cantoci della Cap. Pont. This letter is addreffed to Ovidio Perfapegi, in anfwer to fome queries he had fent to him, concerning the thate of mufic in the pontifical chapel ; and the character of fome muficians in its fervice, who were candidates for the place of maeflro di cappella of the Metropolitan church at Milan.

This letter, printed at Rome 168 , contains characters of the great Roman malte:s, and defriptions of fyles, more refembling found criticifm than any mufical work of the laft century; but it is, unluckily, written in fuch a vein of general panegyric, as is more likely to generate fcepticifm in the minds of modern readers, than conviction. Liberati. was a difciple of Benevoli, and his voice a foprano.

LIBERATUS, a deacon of the church of Carthage, flourifhed about the middle of the fixth century. In the year 534, he was fent to Ronie by a council of African bifops held at Carthage for the purpofe of confulting with pope John about fome dubious points; and he was frequently employed refpecting affairs of importance. He drew up an hitorical memorial of the contelts which arofe about the opinions of Neforius and Eutyches, entitled "Breviarum de Caufa Nelturii et Eutychetis, \&c." The materials made ufe of on this occafion were collected from the relations of various credible perfons, the hiltory of the church, tranflated out of Greek into Latin, authentic acts of councils, and the letters of different bihhops. An ap-1 pendix to this Breviarum is given by father Crabbe, in the fecond volume of his edition of the Councils. Mureri.

LIBERGA, in Geograply, a torn of Pruffia, in the palatinate of Culm: 26 miles E. of Culm.

LIBERHOF, a town of Pruffia, in the province of Pomerelia; 18 milles S.S.E. of Dantzic.

Liberi Tauri Libertas. See Tauri.
LIBERIA, a fealt held among the Romans, on the day whereon their children laid alide their juvenile habits, and anumed the robe called zoga liberia.

The liberia were kept on the 16 th of the kalends of April ; that is, on the 17 th of March.

LIBERIUS, pope, in Biography, a native of Rome, who, having difcharged the duties of different ecclefiaftical offices with reputation, was chofen bifhop in 352. Immediately after his election he wrote to Athanalius, fummoning him to appear at Rome, and clear himfelf from the accufations preferred againt him by the eaftern bilhops. It fhould feem he had afterwards a much better epinion of Athanafius, and undertook his defence with great zeal. With this view he fent legates to a council which the emperor Conftantine had fummoned to meet at Arles, but had
the mortification to hear they had betrayed the caufe enirulted to them. When Liberius was told of the conduct of his deputies, he was filled with refentment and forrow, and difavowed it in the ftrongett terms, as well in his decla. rations, as is his correfpondence. He requelted the emperor to affemble a new council, for the purpofe of examining the matters in difpute between Athanafius and his opponents, and of reftoring peace and tranquillity to the Catholic church. A council was accordingly held at Milan in 35), at which there were 300 weltern bihops, and a few from the eaft. So far from calm difcuffion into the merits of the queftion, the emperor infifted upon it, as a preliminary meafure, that they fhould give their fignatures to the condemnation of Athanafius, and alfo to an edict containing the chief tenets of Arius, which had been publifned in his name. Thofe who had refolution to oppofe the will of the emperor were threatened with intlant execution, and were actually banifhed. Such were the means ufed by Conltantius in obtaining the fignatures of by far the greater part of the weftern bifhops to the condemuation of Athanafus; but Liberius fill declared in his favour, and exerted himfelf, by all the means in his power, to gain others to his party. At length, the emperor having failed, by threats and proffered bribes, to gain the fuffrages of the pope, he determined to apprehend him, and gave his order accordingly. This was executed in the dead of night, to prevent any commotion among the people, who were much attached to their bifhop; he was carried firlt to Milan, and thence to Berrea in Thrace. The hardhips which Liberius experienced in exile, difpofed him to yield to conditions which at one time he would have rejected with the utmoft indignation. He not only fubfribed to the condennation of Athanafius, but received, as Catholic, the Arian confeftion, and made other conceffions ftill more difgraceful to his reputation as bifop of the holy Roman fee. Before he could reach Rome, the emperor had embraced the doctrine of the Semi-Arians, and obliged Liberius to do the fame; fo that this pontiff, who, of courfe, was always the infallible head of the church, avowed himfelf an Athanalian, an Arian, and a Semi-Arian. On account of his obedience, be was permitted to return to Rome, on condition that he fhould govern the church jointly with Felix Il. (See the article.) Liberius arrived at Rome in Auguft, 358, and entered the city in a kind of triumph, being met on the road, and received by the people at large with loud acclamations of joy. He died in September, 366, after he had prefided over the Roman fee fourteen years; and notwithftanding his repeated change of religious opinions, he is honoured both by the Latin and Greek churches as a faint. "A Dialogue with the Emperor Conftantius" is afcribed to Liberius; fo, likewife, are twelve "Letters," inferted in the fecond volume of the Collect. Conci). Bower. Moreri.

LIBERO, Ital., free, unconfined, in Mufic, the fame as fciolto: oppofed to Legato, reftrained by particular laws. Thus, a free fugue, is diltinguihed from a canon; fuga fciolta, or Livera, from Fuga perpetua. Sce Sciolta, and Legato.

Libertas Ecclestastica, Church Liberty, a frequent phrafe in old writers, who treat of ecclefiaftical immunities. The right of inveltiture, extorted from our kings by the papal power, was at firit the only thing challenged by the clergy', as their liberias ecclefiafica, but by degrees, under the title of church liberty, they contended for a freedom of their perfons and poffeflions, from all fecular power and jurifdiction; as appears by the canons and decrees of the councils held by Boniface, archbihop of Canterbury, at Merton, A. D. 1258, and at London, A. D. 1260, \&ic.

See Lord Littlcton's Hitt. of Hen. II., and Robertion's Hitt, of Ch. V.

LIBERTATE PRObANDA, in Law, an ancient writ that lay for fuch as being demanded for villains, offered to prove themfelves free; directed to the fheriff, that be fhould take fecurity of them for the proving of their freedom before the jultices of affize, and that in the mean time they fhould be unmolelted. IF. N. B. 77.

LIBERTA'ILBUS Allocandis, a writ lying for a citizen or burgets, impleaded contrary to his liberty, to have his privilege allowed. Reg. Orig. 262.

If any claim a fpecial liberty to be impleaded within a city or borough, and not elfewhere, there may be a fpecial writ de libertatibus allocandis, to permit the burgefies to ufe their liberties, \&c. Thefe writs are of feveral forms, and may be fued by a corporation, or by any fingle perfon, as the cafe fhall happen. (New Nat. Br. 509, 510.) The barons of the Cinque Ports, \&c. may fue forth fuch writs, if they aredelayed in having their liberties allowed them. Id.

Libertatibus Exigendis in Ifinere, an ancient writ by which the king commands the jultices in eyre to admit of an attorney for the defence of another man's liberty. Reg. Orig. 19.

LIBERTATIS Anglie Cuftodes. See Custodes,
LIBERTE' de la Miufique, is the title of one of the late M. D'Alembert's Effays in his "Melange de Litterature," publifhed in 1767. After being the champion of Rameau's fyftem, and his baffe fondamentale, he became his opponent, and a convert to Italian mufic. He enters into all the reafoning of Rouffeau againft the French ft yle of compofition, but in a more guarded manner. Indeed, he appears never to have heard good Italian mufic well performed. The Suva Paderna of Pergolefi, exccuted by a troop of Italian burletta fingers, not of the firft clafs, was his ftandard of perfection. He tries hard to perfuade the French that their mufic is bad, without knowing very well in what the Italian was fuperior. Rouffeau had refided at Venice a confiderable time, and feems forcibly to have jelt all the lyric beauties of Metaftafio's poetry, as well as the merit of the great compofers and enchanting powers of the great fingers of his time. This, D'Alembert only knows by tradition. It was eafy for a man of his abilities to ridicule the old French mufic, and praife the Italian; but he was too little acquainted with its real beauties to know why Italian dramatic vocal mufic was fuperior to all other mufic, and the French inferior. But it may, perhaps, be roundly afferted that the French vocal mufic suas, is, and probably ever will be inferior to the Italian from bad finging, as well as from the nafal nature of their language, and the national expreffion founded upon it, by which the vocal organ is vitiated from infancy to age, and its tones in their expreffion rendered unpleafing to all ears but thofe of the natives.

The French, fince the time of Rameau, have often had fine compofitions performed in their theatres, and a well difciplined band to execute them infrumentally; yet, for want of good fingers, the vocal part, which is the beft and molt interefting in an Italian opera, is the worlt in the mufical dramas of France. And for this there are two caufes which affect the compofition as well as the perfurmance of French opera fongs: the compofer, be he a Gluck, a Piçcini, or a Sacchini, having no great vocal talents to difplay, dares not give way to fancy, or aim at new paffages, but, of necef. fity, underwrites the vocal part fo much, that the productions of thefe great mafters for the French ftage are never in favour elfowhere with their greateft adrairers. And even the fumple

## LI B

Fmple and common paffages given to the voice, are fo ill fung, that they give pleafure to no ears but thofe which are accuitomed to nothing better.

In $1766_{7}$, when $D^{\prime}$ Alembert wrote in favour of toleration in the mufical religion of France, the accompaniments to what were called fongs at the opera were fo bufy and fo loud, that he compares the effect to twenty people reading different books at the fame time.
'Though D'Alembert and Rouffeau quarrelled about the expediency of allowing plays to be acted within the walls of Geneva; yet the mathematician in his difcourfe on the liberty of Mufic, is but a commentator on the citizen of Geueva's "Letter concerning French Mufic."

On the fubject of adapting Italian melody to French words, the great geometrician has not taken into his calculation all the objections to its fuecefs. In Italian poetry each verfe is terminated by a double rhyme; and in the French poctry, the mafculine and feminine rhymes are alternate. This mult affect the melody. The mute fyllables in French poetry (which are dogrel in Englifh), can alone receive Italian melody: the mafculine rhymes admit of no imitation.
M. D'Alembert, however, modeftly fays; that all his refections are not worth, a fingle line air in mufic; and adds (after Rouffcau), that "inventing what fucceeds is infinitely preferable to philofophical reafoning: a compofer never thinks of giving precepts who is able to furnifh models : Raphael produced pictures, not differtations. In mufic, we (the French) write reveries; and the Italians compofe and execute mufic." The two nations, in this refpect, refemble the two architects who were candidates at Athens for the erection of a monument which the republic wifhed to raife to a deceafed hero; one of them fpoke a long while with great eloquence on his art ; the other, after liftening with great attention, only uttered thefe words: "What he fays, I have donc."

## Liberties. See Fravcimes.

LIBERTINES, in Scripture Hifory, the denomination of a clafs of Jews, or Jewifh profelytes, who had a fynagogue at Jerufalem, which is mentioned in the book of Acts, ch. vi. 9. Libertinus, or Libertine, denoted a perfon who had been a flave, but who had obtained his freedom; or one who was the fon of a perfon that had becn a flave, and was afterwards made free. Several learned men have fuppofed, that the libertines above-mensioned were Jews, or profelytes of the Jewifh religion, who had been flaves to Roman matters, and had been made free, or the children of fuch. In proof of this, the learned Lardner alleges, that there was a great namber of Jews at Rome; and, according to Philo, they occupied a large quater of the city; and they were chie?y fuch as had been taken captive at feveral times, and had been carried into Italy, and were made free by their Roman matters. That thefe Jews were called Libertines, appears plainly from paffages, which Lardner has cited from Tacitus, Jofephus, and Suetonius, in which they fpeak of the banifhment of the Jews from Rome in the reign of Tiberius. Jofephiss and Suetonius exprefsly call thofe Jews, whom Tacitus calls men of the Libertine race; and as there were many of them at Rume, it is not at all unlikely that they had a fynagogue at Jerufalem. Such are the fentiments of Grotius and Vitringa, adopted by Lardiner's Works, vol. i. p. Ir4.

Limertines, Libertini, in Ecelfiafical Hiffory, a religious rect, which arofe in the year 1525 , whofe principaltencts were, that the Deity was the fole operating caufe in the mind of man, and the immediate author of all human actions: that,
confequently, the diftinctions of good and evil, which had been eftablifhed with regard to thofe actions, were falfe and groundlefs, and that men could mot, properly fpeaking, commit fin ; that religion confifted in the union of the fipirit, or rational foul, with the Supreme Being ; that all thofe who had attained this happy union, by fublime contempla. tion and elevation of mind, were then allowed to indulge, without exception or reftraint, their appetites or paflions; that ali their actions and purfuits were then perfectly innocent; and that, after the death of the body, they were to be united to the Deity.

They likewife faid that Jefus Chrift was nothing but a mere je ne Sçai quoi, compofed of the fpirit of God, and of the opinion of men.
Thefe maxims occafioned their being called Libertines: and the word has been ufed in an ill fenfe ever fince.

The Libertini fpread principally in Holland and Brabant. Their leaders were one Quintin, a Picard, Pockefius, Ruffus, and another called Chopin, who joined with Quintin, and became his difciple.
This fect obtained a certain footing in France through the favour and pretection of Margaret, queen of Navarre, and filter of Francis I., and found patrons in feveral of the reformed churcbes. This fect was probably a remnant of the more ancient Beghards, or Brethren of the Free Spirit. Mofheim's Eccl. Hitt. vol, iv.

Libertines of Genevà, were a cabal of rakes rather than of fanatics: for they made no pretences to any religions fyftem, but pleaded only for the liberty of leading volup. tuous and immoral lives. This cabal was compoled of a certain number of licentious citizens, who could not bear the fevere difcipline of Calvin, who punifhed with rigour not only diffolute manners, but alfo whatever bore the afpect of irreligion and impiety. In this turbulent eabal there were feveral perfons who were not only nutorious for their diffolate and feandalous manner of living, but alfo for their atheitical impiety and contempt of ali religion. To this odious clafs belonged one Gruet, who denied the divinity of the Chriftian religion, the immortality of the foul, the difference between moral good and evil, and rejected with difdain the doctrines that are held moft facred among Chriftians ; for which impieties he was at laft brought before the civil tribunal, in the year 1550, and condemned to death. The Genevan firit of reformation, improperly directed by the violence and zeal of Calvin, did at this time operate to a degree, which has marked the character of this great reformer with reproach. For, in 1544, Sebailian Caftalio, mafter of the public fchool at Geneva, who was a man of probity, and diftinguihed by his learaing and tafte, was, neverthelefs, depofed from his office and banifhed the city, becaufe he difapproved fome of the meafures that were purfued, and fome of the optnions entertained by Calvin and his colleagues, and particularly that of abfolute and unconditional predeftination. Jerome Bolfec, alfo, a man of genius and learning, who became a convert to the Proteftant religion, and fled to Geneva for protection, was calt into prifon, and, foon after, fent into banihment, becaufe, in 155 I , he imprudently and indecently declaimed, in full congregation, and at the clofe of pubhic worfhip, againft the doctrine of abfolute decrees. Mofheim's Eccl. Hiit. vol. iv.

Libertus, or Libertinus, among the Romans, a freedman, or a perfon fet free from a legal fervitude.

Thefe fill retained fome mark of their ancient ftate; he who made a flave free having a right of patronage over the libertus; fo that if the latter failed of the wing due refpect to his patron, he was reftored to his fervitude ; and if the liber-
tus died without children, his patron was his heir. Sce Slave.
In the beginning of the republic, libertinus denoted the fon of a libertus, or freed-man; but afterwards, before the time of Ciccro, and under the emperors, the terms libertas and libertinus, as Szetonius has renarked, were ufed as fy. nonymots.

LIBERTY, in Geggraphy, a poftoown of America, in Virginia; 15 miles from New London. This is the chief town of Bedford county; it has a handfome court-houfe, and contains 50 or 60 houfes.-Alfo, a county of Georgia, bounded N. by Brian, S. by Mackintofh, W. by Alatamaha, and N. E. by the ocean. It is 40 miles long, and 22 broad. The productions are cotton and rice. An acre of land yields 25 or 30 bufhels of corn. It derives its name from the circumftarice, that its inhabitants were the firt in the fate who declared for libert $y$, and fent a delegate to the congrefs at Philadelphia. It is divided into five towns, and contains 53 r 3 inhabitants, of whom $394^{\circ}$ are flaves.-Alfo, a polt-town of Maryland, in Frederick county; 12 miles N.E. of Frederickfown, and about 44 miles N.N.W. of the Federal city.

Liberty, Libertas, is ufually underfood of that fate wherein a man acts freely; or that power by which he determines himfelf voluntarily either to good or evil, to this thing or that.

This is what fome have denominated a liberty of indifference, natural liberty, philofopbical liberty, or liberty of choice; defining it to be a power of doing an action or its contrary, all the previous circumitances remaining the fame. In this fenfe it flands oppofed to neceffity, and is diftinguifhed from ezternal liberty, or liberty of aation, which is defined to to be the power of doing what we pleafe or will; or, in other words, the power of carrying our volitions or purpofes into effect. This exicrnal liberty is oppofed to compulfion from external force, as philofopbical liberty is to ne--ceffy, or the definite influence of motises, in definite circuusflances. Accordingly it is faid; that liberty of alion may exit independently of liberty of choice ; that is, the mind may be wholly unreitrained in the execution of its volitions, though in the fame circumilances it could not have made a different choice. Liberty of choice likewife, if it exits at all, is perfectly independent of hiberty of azion.

Molt of the fchoolmen confound liberty and the will torether, and make one definition ferve for both. Whereas Mr. Locke offerves, that liberty does not belong to the will, but to the man or agent; and therefore, that the queftion, in the ufual manner of ftating it, whether man's will be free or not, is abfurd and unintelligible. Liberty, which is but a power, belongs only to agents, and canoot be an attribute or modification of the will, which is alfo but a power. They diftinguifh liberty into a great many kinds ; as liberty of contrariety, and liberty of contradifion. (See Freedmar.) Alfo, next liberty, provima, which is a full abfolute freedom of doing any thing : remote liberty, which is a liberty that comprehends a natural power, though embarraffed with obftacles, which it is in our power to remove, and to attain to a next liberty. Some writers have divided liberty into

Liberty, Phyfical, or Pbilofopbical, or liberty of choice, which is that principle of fpontaneity or felf-determination, that contitutes us agents; or that gives us a command over our actions, rendering them properly our's and not effects of the operation of any foreign caufe. Without this liberty, or being under a neceffity of always following fone will different from his own, man would be a machine acted upon by mechasical fprings, laving no principle of motion in himfelf
or command over events: and, therefore, incapable of all merit and demerit.
Whether man is enducel with this kind of liberty or felfdetermining power has been a fubject of much controverfy: it was agitated at the beginning of the lait century, between Leibnitz, Collins, \&c. on one fide, and Clarke, Jackfon, \&c. On the other; and has been more kately revived by

Cicero defines liberty the power of living after a mari's own wifh, without any caufe or impediment to oblige him to do one thing rather than another.
F. Malebranche gives us a thill more philofophical definition: the will he defines to be that imprefion, or natural motion, which inclines towards good in the general ; and by liberty, he underitands, that power which the mind has of determining this general imprefion towards fuch objects as pleafe us; and fo of directing our general inclinations to fome particular things.

Whence it is eafy to perceive, that though all natural inclinations be voluntary, yet they are not all free; not, we mean, with a liberty of indifference, which includes a power of willing, or not willing, or of willing quite the contrary to that whieh our natural inclinations lead us to. For though it is voluntarily and freely that we leve good in general, it is abfurd to fuppofe we fhould love any thing without the will, or that the will can ever be conftrained; yet we do not love it freely (in the fenfe juft laid down) becaufe it is not in the power of the will not to defire to be happy.
It mult be obferved, however, that the mind, confidered as determined towards good in general, cannot divert its motion to any particular good, unlefs the fame mind, confidered as capable of ideas, have fome knowledge of that particular good : that is, in plainer terms, the will is a blind power, that cannot direct itfelf to any thing but what the underitanding reprefents to it; fo that the power which the will has to determine its impreffion towards general good, or its natural inclinations, varioufly, confifts in the power it has to com. mand the underitanding to reprefent fome particular good.

Thus, a perfon, for inftance, reprefents fome dignity to himfelf, as a good to be wifhed for, immediately the will defires this good; that is, the impreffion which the mind continually receives towards good in general, determines it zo this dignity. But as that dignity is not the univerfal grod, nor is perceived clearly and dittinctly as fuch by the mind (for the mind cannot conceive a thing clearly which is not), the impreffion we have towards grod in gexneral, is not entirely exhaulted by that particular good; the mind has an inclination to go farther; it does not love that dignity necelfarily or invincibly, and in this refpect is free.

Now its liberty confifts in this, that, not being fully convinced that this grood contains in it all the good it is capable of enjoying, it may fufpend its judgment and its defire.
The cafe is nearly the fame with regard to the knowledge of truth: we love this, as we do the enjoyment of good, by a natural impreffion; which impreflion is not invincible in the latter, excepring evidence be full, and our knowledge of the object complete. We have the fame liberty in our falle judgments, that we have in our irregular appetites. See Ildggient and Will

Mr. Locke defines liberty to be the power which a man has to do or forbear doing any particular action, according as its doing or forbearance has the actual preference in the mind, which is the fame thing as to fay, according as he himfelf wallis it : and he obferves, that fo far as a man has power to think or not to thiniz, to mave or not to move, ac.
cording
cording to the preference or direction of his own mind, fo far is a man free. The will, he acknowledges, is always determined by fome, and for the molt part, by the moft preffing unealinefs or defire of happinefs. The liberty for which he contends, and for the exiltence of which he appeals to experience, is a liberty of fufpending our determination. The mind, he fays, having in molt calcs, as is evident in experience, power to fufpend the execution and fatisfaction of any of its defires, and fo all, one after another, is ar liberty to confider the objects of them, examine them on all fides, and weigh them with others. In this lies the liberty a man has. He has a power to fufpend the profecution of this or that defire, as every one daily may experience in himfelf. This feems to be the fource of all liberty. In this feems to confift, as he thinks, that which is improperly called freewill. And he adds farther, that perfect indifference in the mind, not determinable by its latt judgrment of the good or evil, that is thought to attend its choice, would be fo far from being an advantage'and excellency of an intellectual nature, that it would be as great an imperfection as the want of indifferency to act or not to act, till determined by the will, would be an imperfection on the other fide. Eff. vol. i. book i. chap. 2 r.

From thefe concelfions the advocates for neceflity have pleaded the authority of Mr. Locke, though he does not feem to have been apprized of the confequences of his principles. Mr. Hubbes, who feems to have been the firtt who underftood and maintained the proper doctrine of philofophical neceffity, defines liberty to be the abfence of all impediments to action, that are not contained in the nature and intrinfic quality of the agent. And Mr. Collins, the principal writer on the fide of neceffity, defines liberty to be a power in man to do as he wills, or pleafes; though he denies, that we are at liberty to will, or not to will ; or to will one or the other of two or more objects, between which, all things conlidered, we perceive a difference; or that we are free in our choice among things different or alike.

Dr. Clarke has remarked, that, in the above definition, there is an ambiguity in the words, "wills or pleafes;" becaufe they may either denote the lalt perception or judgment of the undertanding, which is entirely paffive ; or the firft exertion of the felf-moving power, which is effentially active. Now, though the felf-moving power is an adequate caufe of action, yet underltanding, or judgment, or allent, or approbation, or liking, or whatever name it is called by, can no more poffibly be the efficient caufe of action, than reft can be the caufe of motion. Nothing can poffibly be the caufe of an effect more contiderable than itfelf. Nothing that is paffive can poffibly be the caufe of any thing that is active: an occafion indeed, it may be; and action may be confequent upon perception or judgment; it may eafily be fuppofed to be always confequent upon it, and yet at the fame time there may be no manner of phylical or neceffary. connection between them. Befides, the word "do," in this definition of Mr. Collins, has no fignification. For his meaning is not, that the man "acts" or "does" any thing; but the liberty or power in man to do as he wills or pleafes, is with him exactly and only the fame as the liberty or power in a balance would be to move as it wills or pleafes; fuppofing the balance endued with fuch a fenfationor intelligence, as enabled it to perceive which way the weights turned it, and to approve the motion, fo as to fancy that it moved itfelf, when indeed it was only moved by the weights. Mr. Collins makes the difference between a man and a clock, to confift only in fenfation and intelligence, not in any power of acting: whereas the whole effence of liberty confifts in the
power of acting: fo that action and liberty are identical terms.

The liberty of a moral agent, according to Dr. Reid, is a power over the determinations of his own will. If, in any action, he had power to will what he did, or not to will it, in that action he is free. But if, in every voluntary action, the determination of his will be the neccffary confequence of fomething involuntary in the ftate of his mind, or of fomething in his external circumftances, he is not free; he has not the liberty of a moral agent, but is fubject to neceffity. This liberty fuppofes the agent to have underttanding and will; for the determinations of the will are the fole object about which this power is employed; and there can be no will without fuch a degree of underitanding at leaft, as gives the conception of that which we will. The liberty of a moral agent implies, not only a conception of what he wills, but fome degree of practical judgment or reafon. For if he has not the judgment to difcern one determination to be preferable to another, either in itfelf or for fome purpofe which he intends, what can be the ufe of a power to determine? His determinations muft be made perfectly in the dark, without reafon, motive, or end. They can neither be right nor wrong, wife nor foolifh. Whatever the confequences may be, they cannot be imputed to the agent, who had not the capacity of forefeeing them, or of perceiving any reafon for acting otherwife than he did. The author now cited reltricts his attention to the liberty of moral agents, who are capable of acting well or ill, wifely or foolinhly ; and this liberty he calls, by way of difinction, " moral liberty." By neceffity he underitards the want of this moral liberty. This moral liberty a man may have, though it do not extend to all his actions, or even to all his voluntary actions. He does many things by inllinct, many things by the force of habit, without any thought at all, and confequently without will. But in general this power over the determinations of his own will extends to every action for which he is accountable. This power may be impaired or loft, by diforder of body or mind, as in melancholy, or in madnefs; it may be impaired or loft by vicious habits ; and, in particular cales, it may be reftrained by divine interpofition. In fact, man is a free agent in the fame way as he is a reafonable agent. His realon is liable to be impaired or loft by his own fault, or by other means. It is alfo the cafe with refpect to his freedom of action. The liberty above ftated and explained has been reprefented by fome philofophers as inconceivable, and as involving an abfurdity. "Liberty," fay Hobbes and others who have adopted his reafoning, "confilts only in a power to act as we will; and it is impoffible to conceive in any being a greater liberty than this. Hence it follows, that liberty does not extend to the determinations of the will, but only to the actions confequent to its determination, and depending upon the will. To fay we have power to will fuch an action, is to fay, that we may will it, if we will. This fuppofes the will to be determined by a prior will; and for the fame reafon, that will mult be determined by a will prior to it, and fo on in an infinite feries of wills, which is abfurd. To act freely, therefore, can mean nothing more than to act voluntarily ; and this is all the liberty that can be conceived in man or in any being." The advocates of neceflity maintain, that this is the only liberty that is pofible, that is conceivable, and that does not involve an abfurdity. Dr. Reid, however, mentions three other kinds of liberty, to which the term is very commonly applied: fuch are liberty, as oppofed to external force or confinemeut of the body; liberty as oppofed to obligation by law, or

## LIBERTY.

by lawful authority; and liberty as oppofed to neceffity; in which latter fenfe it extends to the determinations of the will only, and not to what is confequent to the will. It has been a queltion among philofophers, whether, in every inftance, the determination of the will, which is the firf part of the action in every voluntary action, and upon which alone the moral eltimation of it depends, be the neceffary confequence of the conftitution of the perfon, and the circumittances in which he is placed; or whether he has not power, in many cafes, to determine this way or that? This has, by fome, been called the "philofophical" notion of liberty and neceffity; but it is by no means peculiar to philofophers. The lowelt of the vulgar have, in all ages, had recourfe to this neceffity for exculpating themfelves or their friends when they do wrong, though, in the general tenour of their conduct, they ait upon the contrary principle. Whether the notion of moral liberty, above fated, be conceivable or not, every man mult judge for himfelf, "To me," fays Dr. Reid, "there appears no difficulty in conceiving it. I confider the determination of the will as an effect. This effiect mult have a caufe which had power to produce it; and the caufe mult be either the perfon himfelf, whofe will it is, or fome other being. The firit is as eafly conceived as the latt. If the perfon was the caule of that determination of his own will, he was free in that action, and it is jullly imputed to him, whether it be good or bad. But if another being was the caufe of that determination, either by producing it immediately, or by means and inftruments under his direction, then the determination is the at and deed of that being, and is folely imputable to him." Should it be faid, that nothing is in our power but what depends upon the will; and therefore the will itfelf cannot be in our power; it may be replied, that this is a fallacy arifing from taking a common faying in a fenfe which it was never intended to convey, and in a fenfe contrary to what it neceflarily implies. To fay that what depends upon the will is in a man's power, but the will is not in his power, is to fay that the end is in his power, but the means neceffary to that end are not in his power, which is a contradiction.

The principal arguments in favour of liberty, as it is popularly undertood, and as it is defined in the beginning of this article, are the following: this principle is neceffary to conttitute man an agent (fee Agevt); for, as far as it is true of a being that he acts, fo far he muft himfelf be the caufe of the action, and, therefore, not neceflarily determined to act: but if he has no abfolute power over his own actions, i. e. if he be not a free agent, the actions which he performs cannot properly be faid to be his own, but mult be afcribed to fome other power, by which he is led on to perform them; as a good clock or watch performs the motions afiigned to it by the artilt. This argument is excellently illuftrated by Dr. Clarke: man, fays he, either has within himfelf a principle of action properly fpeaking, i. c. a folf-moving faculty, a principle or power of beginning motion, or he lias not. If he has within himfelf fuch a principle, then he is a free, and not a neceffary agent: for cvery neceflary agent is moved neceffarily by fomething elfe; and then that which moves it, not the thing itfelf which is moved, is the true and only caufe of the action. That any other thing operating upon an agent, fhould efficiently and neceflarily produce felf-motion in that agent, is a direct contradiction is terms. If man has not within himfelf a principle or power of felf-motion, then every motion and action of man is chiefly and properly produced by the efficiency of fome extrinfic caufe; which caufe muft be either what we ufually call the motive or reafon upon which a man

Voz. XX.
acts; or elfe it maft be fome infenfible fubtile matter, or fome other being or fubftance making an impreflion upon him. If the reafons or motives upon which a man acts be the immediate and efficient caufe of the action, then either abftract notions, fuch as all reafons and motives are, have a real fubfiftence, that is, are themfelves fubitances; or elfe that which has itfelf no real fubfiftence can put a body into motion ; either of which is manifeftly abfurd. If infenfible fub:ile matter, or any other being or fubllance, continually making impreffion upon a man, be the immediate and efficient caufe of his acting; then the motion of that fubtile matter or fubftance mult be caufed by fome other fubftance, and the motion of that by fome other, till at laft we arrive at a free agent; and then liberty is a pofible thing, and man poffibly may have liberty: and if he may poffibly lave it, then experience will prove that he probably, nay, that he certainly, has it. If we never arrive at any free caufe, then there is either in infunitum a progreffion of motions without any mover, of effects without any caufe, of things acting without any agent; which is a manifelt contradiation: or elfe motios exilts neceflarily of itfelf. If motion exifts neceffarily of itfelf, it mult be either with a determination every way, or one certain way; if with a determination every way, this is no motion at all; if with a determination one certain way, then that determination is either neceffary, and confequently all other determinations impoffible, which is contrary to experienoe; or elfe there mult be a particular reafon of that determination, and ro backwards in infinitum, which comes to the forementioned abfurditf, of effects exifting without any caufe.

Farther, hberty is the ditate of our own confcioufnefs: we have, really, the fame conftant and necefiary confcioufnefs of liberty that we bave, that we think, choofe, will, or even exilt ; and whatever men may fay to the contrary, it is impoffible for them, in earneft, to think they have no active felf-moving powers, and are not the caufes of their own rolitions, or not to afcribe to thomfelves what they mult be confcious they think and do. Mr. Hume, though he denies the reality of liberty, grants that we have a feeling of it ; that the divine plan required that we fhould be fo made, as to feem to ourfelves free; that the whole conflitution of things is as if we were free; and that being under a neceflity of approving and difapproving actions and charasters, we are fo far under a neceffity of believing ourfelves and others free. After thefe conceffions, it can hardly be imagined that the conftitution of nature fhould be altogether impofition and deceit.
"We have by our conflitution," fays Dr. Reid, "a natural conviction or belief that we act freely; a conviction fo early and fo univerfal, that it mult be the refult of our conftitution, and the work of him that made us." And he alds, "the genuine dictate of our natural faculties is the voice of God no lefs than what he reveals from heaven; and to fay that it is fallacious, is to impute a lie to the God of truth." Moreover, in favour of free-will an appeal has been made to "common fenfe," that is, to the irrefiftible convittion and univerfal confent of mankind. To this purpofe it has been faid, that very fow have denied the cxitence of liberty of choice even in theory; but "this," fays a neceffarian writer, " is only faying that there have been very few philofophers," as if the denial of liberty of choice were a teft of true philofophy. All men, it has been alleged, without excepting profeffed neceffarians themfelves, are under the necefify of acting upon the principles of liberty, whatever their hypothetical fpeculations may be.

All men agree in applauding fome actions and condemning 43 others,

## LIBERTY.

others, which would be abfurd upon the fuppofition that men were dellitute of free will; all men make a diltinction betwcen harm and injury, e. g. between a blow given by defign and another occationed by accident; and the laws of all nations agree to punifh an action performed by a man in poffeffion of reafon, when they excufc a lunatic; the former being free, and the latter not.

Befides, if man be not, in the ftricteft fenfe of the word, a free agent, he can be no moral agent. It is hard to fay, what virtue and vice, commendation and blame, mean, if they do not fuppofe agency, voluntary motion, free choice, and an abfolute dominion over our refolutions. Can we applaud or reproach ourfelves for what we were no more the caufes of than of our own beings, and what it was no more poffible for us to prevent than the returns of the feafons, or the revolutions of the planets? On the fyltem of neceflity, confcience is an inexplicable principle: its cenfures or applaufe are equally futile and groundlefs: the approbation of mankind is an infult with regard to thofe on whom it is beftowed, becaufe they can have no merit; and the reproach of men unjuft and cruel, becaufe there can be no demerit and ground of blame. Whatever difficulties, therefore, may attend the nature of that influence which we afcribe to motives, (fee Motive,), they cannot be the efficient neceffitating caufe of human actions: fince, on this fuppofition, there could be but one agent in the univerfe; who mult equally be the author of all the good and evil in the world, and on whom muft ultimately be charged the fin and mifery, as well as the virtue and happinefs of his creatures.

Morenver, it has been urged by the advocates of liberty, that if men's determinations and actions flow neceflarily from the previous ftate of their minds and the motives or influences refulting from a nature or condition, impofed upon them without their own confent or choice, the idea of refponfibility or accountablenefs mult vanifh, and there can be no propriety or ufe of rewards or punifhments. God cannot reward without virtue, and there can be no virtue without a felf-determining power : he cannot punifh without guilt, and there can be no guilt when men do what they cannot avoid doing, and when their actions arife from circumfances in which their Creator placed them.

It is alfo equally unjuit and ufelefs to threaten punifhment or inflict it on'men to prevent crimes, when they are neceffarily determined in all their actions. And if men are neceflary agents, though we cannot well admit this verbal contradiction, it can be of no ufe to reafon with them, to admonifh or intreat them; and God muft be infincere in his addrefles and invitations, and cruel in his requirements and commands. But fuch is the whole tenour of revelation, and, therefore, the conclufion is neceffary, that man is a free agent, capable of good or evil, and of determining his purfuit of either, from the fole power of his own judgment or will.
"If we adopt the fyltem of neceffity," fays Dr. Reid, "the terms moral obligation and accountableness, praife and blame, merit and demerit, juflice and injuflice, recward and punij/3ment, wifdom and folly, virtue and vice, ought to be difufed, or to have new meanings given to them when they are ufed in religion, in morals, or in civil government; for upon that fyftem, there can be no fuch things as they have been always ufed to fignify:" Another argument for proving that man has power over his own actions and volitions has been deduced from the confideration that he is capable of carrying on wifely and prudently, a fyftem of conduct, which he has before conceived in his mind, and refolved to profecute. If all the particular determinations, which concurred
in the exccution of the plan which fuch a perfon had formed ${ }^{2}$ ? were produced, not by himfelf, but by fome caufe acting neceffarily upon him, then there is no evidence left that he contrived this plan, or that he ever §pent a thought about it. The caufe that directed all thefe determinations fo wifcly, mult be wife and intelligent. If it be faid, that this whole courfe of determinations was produced by motives, motives furely have not underftanding to conceive a plan, and intend its execution. We muft therefore revert to fome intelligent being, who had the power of arranging thefe motives, and applying them, in their proper order and feafon, fo as to bring about the end. If man, then, had no concern in the execution, we have no evidence left, that he had any concern ia the contrivance, or even that he is a thinking being. Man, with all his boafted faculties, is reduced to the flate of a mere automaton or machine. Whereas, if wife conduct in a man demonifrates that he has fome degree of wifdom, it demonitrates, with equal force and evidence, that he has: fome degree of power over his own determinations. We fhall ciofe this article with obferving, that Mr. Abraham Tucker, the acute author of a work entitled "The Light of Nature purfued," by Edward Search, efq. after having argued ftrenuouly againt the exitence of a liberty of indifference, contends for the eaiftence of free-will, the exercife of which he conceives "to be only a particular fpecies: of action, performed in raifing up ideas, or fixing them on the mind, which fhall determine us to fuch volitions as we want." He exprefsly difavows the doctrine of neceffity. See on this fubject Collins's Enquiry concerning Human Liberty, firft printed in 1717. For the objections againfl liberty, and the arguments in fupport of neceffity, fee Necessitx.

Liberty of corfcience, a right or power of making profeffion of any religion, or of ferving God in any manner that: a man fees fit.

This feems to be a natural right; it is vigoroully oppofed by the generality of the Romanitts, andeven by many of the reformed, though it feems as if the reformation could fcarcely fubfilt without it. See Toleration and Persecution.

Liberty, Moral, is the power of following, in all circumflances, our fenfe of right and wrong; or of aeting in conformity to our reflecting and moral principles, without being controlled by any contrary principles or habits. See Liberty, fupra.

Liberty, Religious, is the fame with liberty of confcience, and fignifies the power of exercifing, without moleflation, that mode of religion which we think belt; or of making the decifions of our own confciences, refpecting religious truths, the rule of our conduct, and not any of the decifions of others.

Liberty, Civil, is the power of a civil fociety or ftate, to govern itfelf by its own difcretion: or by laws of its own making, without bcing fubject to any foreign difcretion, or to the impofitions of any extraneous will or power. Civil liberty, fays judge Blackflone, adopting the definition of the Inflitutes, confifts in the power of doing whatever the laws permit ; or it is natural liberty, or a power of acting as one thinks fit, without any reftraint or controul, unlefs by the
law of nature, fo far reitraincd by human laws, and no farther, as is neceffary and expedient for the general advantage of the public. Others have defined civil liberty, in contradiftinction from political liberty, to be that power over their own attions, which the members of the flate refery too themfelves, and which their officers mult not infringe. extends no farther than to a man's ove conduct, and fign wes the right he has to be exempt from the controul of the foc ety or its agents, that is, the power he has of providing for his own advantage and happinefs. It is a man's civil liberty, which is originally in its full force, and part of which he facrifices when he enters into a flate of focicty.

Civil liberty, according to the definition of archdeacon Paley, " is the not being reftrained by_any law, but what conduces in a greater degree to the public welfare." To do what we will, he fays, is natural liberty; to do what we will, confiftently with the intereft of the community to which we belong, is civil liberty; that is, the only liberty to be defired in a fate of civil fociety. The definition abore laid down imports that the laws of a free people impofe no reftraints upon the private will of the fubject, which do not conduce in a greater degree to the public happinels; by which it is intimated, itt, that reftraint itfeif is an evil; zdly, that this evil ought to be overbalanced by fome public advantage; $3^{\text {dly }}$, that the proof of this advantage lies upon the legiflature; $4^{\text {thly }}$, that a law, being found to produce no Fenlible good effects, is a fufficient reafon for repealing it, as adverfe and injurious to the rights of a free citizen, without demaniding fpecific evidence of its bad effeets. This maxim, our author adds, might be remembered with advantage in a revifion of many laws of this country; efpecially of the game laws; of the poor laws, fo far as they lay reftrictions upon the poor themfelves; of the laws againt papits and diffenters; and amongft a people enamoured to excefs, and jealous of their liberty, it feems a matter of furprife that this principle has been fo imperfectly attended to. The degree of actual liberty always bearing, according to this account of it, a reverfed proportion to the number and feverity of the reftrictions, which are either ufelefs, or the utility of which does not outweigh the evil of the reltraint, it follows, among other conclufions of a more general nature, that we may hence be enabled to apprehend the diftinction between perfonal and civil liberty. A citizen of the freet republic in the world may be imprifoned for his crimes; and though his perfonal freedom be reitrained by bolts and fetters, fo long as his confinement is the effect of a beneficial public law, his civil liberty is not invaded. Another idea of civil liberty places it in fecurity ; making it to confift not merely in an actual exemption from the conftraint of ufelefs and noxious laws and acts of dominion, but in being free from the danger of having any fuch hereafter impofed or exercifed. The definitions which have been framed of civil liberty are moft of them adapted to this idea. Thus one political writer makes the very effence of the fubject's liberty to confilt in his being governed by no laws but thofe to which he hath actually confented; another is fatisfied with an indirect and virtual confent; another again places civil liberty in the feparation of the legifative and executive offices of government; another in the being governed by lazv, that is, by known, preconitituted, inflexible rules of action and adjudication; a fifth in the exclufive right of the people to tax themflelves by their own reprefentatives; a fixth in the freedom and purity of elections of reprefentatives; a feventh in the controul which the democratic part of the conflitution poffeffes over the military eflablifhment. Of thefe and fimilar accounts of liberty, it may be obferved, that they all labour under one inaccuracy, viz. that they defcribe not fo
much liberty itfelf, as the fafeguards and prefervatives of liberty ; e. g. a man's being governcd by no laws but thofe to which he has given his confent, were it practicable, is tro otherwife neceflary to the enjoyment of civililiberty, than as it affords a probable fecurity againit the diftation of laws, impofing fuperfluous reftrictions upon his private will. 'The fame remark is applicable to the relt. We may farther obsferve, that in molt of thefe definitions civil liberty, and pulitical liberty are confounded. Upon the whole we may remark, that whatever definitions of cither kind of liberty we adopt, that people, government, and conltitution is the freef, which makes the bett proviiion for the cnactiog of experient and falutary laws.

Liberty, Political, fometimes ufed, but improperly, as fynonimous with civil liberty, in a diftinet fenfe, confitts in the fhare which the members of the ftate poifefs in the direction of its affairs, and the power which they referve to themfelves of arriving at the public offices, or, at lcalt, of having votes in the nomination of thofe who fill them: and this is that which a man may or may not acquire in the compenfation he reccives fur it. In a flate of civil liberty, a man retains the molt important of his natural rights: in is ttate of political liberty, he moreover acquires a contron! over the conduct of others. It is, therefore, for his advantage to lofe as little of the former, and to gain as much of the latter as he can. In countrics where every member of the fociety enjoys an equal power of arriving at the fupreme offices, and confequently of directing the flrength and the fentiments of the whole community, there is a thate of thee molt perfect political liberty. On the other band, in countries where a man is, by his birth or fortune, excluded from thefe offices, or from a power of voting for proper perfons to fill them; that man, whatever be the form of the government, or whatever civil liberty or power orer his own actions he may have, has no power over thofe of another; he has no fhare in the government, and therefore has no political liberty at all. Nay, his own conduct, as far as the fociety does interfere, is, in all cafes, directed by others.

Political liberty is the only fafe-guard of civil liberty; and it is chiefly valuable on that account. Civil liberty flands firft in the order of things, and political liberty the fecond. The former is the end, and the latter the means of preferving it. Every man has an abfolute and unslienable right to civil liberty; and for the fecurity of it, political liberty fhould be extended as widely as poflible. No man fhould be excluded from the exercife of it, excepting from circumftances of unavoidable neceffity. It may appear, at firlt fight, to be of little confequence whether perfons in the common ranks of life enjoy any fhare of political liberty or not. But without this, there cannot be that perfuafion of fecurity and independence, which alone can encourage a man to make great exertions. A man who is fenfible that he is at the difpofal of others, over whafe conduct he has no fort of controul, has always fome unknown evil to dread. He will be afraid of attracting the notice of his fuperiors, and muft feel himfelf a mean and degraded being. But a fenfe of liberty, and a knowledge of the laws by which his conduct mult be governed, with fome degree of controul over thofe who make and adniniter the lavs, give him a conttant feeling of his own importance, and lead hinn to indulge a free and manly turn of thinking, which will make him greatly fuperior to what he would have been under an arbitrary form of government. The diftinction here made between civil and folitical liberty was, we believe, firlt laid down by Dr. Priettley in his "Treatife oal Government."

Mr. Chriftian, in his edition of Black ttone's Commentary
has fuggefed the difference between civil and political libert), "unnoticed by the learned judge and by other eminent writers. He defines pulitical liberty to be the feenrity with which, from the confitution, form, and nature of the eftablithed government, the fubjects enjoy civil liberty.
The importance of liberty, civil and political, as well as religious, to the honour and profperity of a nation, is fulficicutly cyinced by both ancient and modern hillory. It has been obferved by the aucients, that all the arts and feiences arofe among free nations; and that the Perfians and Egyptians, notwithftanding their eafe, opulence, and luxury; made but faint efforts towards a relifh in thofe fince plea'ures, which were carricd towards fuch perfection by the Greeks, amidit continual wars, attended with poverty, and the groatel limplicity of life and manners. Greece, fays Mr. Hume, was a clufter of little principalities, which foon became republics; and being united both by their vicinity, and by the ties of the fame language and interelt, they entered into the clofert intercourle of commerce and learniug. There concurred a lappy clinate, a foil not unfertile, and a molt harmonious and comprchentive language; fo that every circumitance among thefe people feemed to favour the rife of the arts and feiences. Each city produced its feveral artilts and philofophers, who refufed to yield the preference to thofe of the neighbouring republics. Their contention and debutes tharpened the wits of men: a variety of objects was prefented to the judgment, while each chailenged the preference to the reft; and the fciences, not being dwarfed by the reftraint of authority, were enabled to make fuch confiderable thoots, as are, even at this time, the objects of our admiration. Hrnce, and from other circumilances detailed by Mr. Hume, he concludes, that it is impuffible for the arts and fciences to arife, at firtt, among any people, unlefs thefe people enjoy the bleffing of a free government. It has been further obferved, that when the Greeks loft their liberty, though they increafed mightily in siches, by means of the conquefts of Alexander; yet the arts, from that moment, declined among them, and have never fince been able to raile their head in that climate. Learning was tranfplanted to Rone, the only free nation at that time in the univerfe; and having met with fo favourable a foil, it made prodigious fhoots for above a century ; till the decay of liberty produced alfo the devay of letters, and fpread a total barbarifin over the world. From thefe two experiments, of which each was double in its kind, and fhewed the fall of learning in abfolute governments, as well as its rife in popular ones, Longinus thought himfelf fufficiently jultified in afferting, that the arts and fciences could never Hourifh, but in a free government; and in this opinion he has been followed by feveral eminent writers in our own country, particularly Mr. Addifon and lord Shaftefoury, who either confined their views merely to ancient facts, or entertained, fays Mr. Hume, too great a partiality in favour of that form of government eftablifhed among us. This writer has alleged, as inftances which ferve to reitrain the extent of the opirion maintained by the celebrated authors above cited, thofe of modern Rome and of Florence. The former carried to perfection all the finer arts of fculpture, painting, and mulic, as well as poetry, though it groaned under tyranny, and under the tyranny of priefts: while the latter made its chief progrefs in the arts and Iciences, after it began to lofe its hberty by the ufurpation of the family of Medici. Ariofto, Taffo, Galileo, any more than Raphael and Michael Angelv, were not born in republics. Ind though the Lombard fchool was famous, as well as the Roman, yet the Venetions have had the fmalleft fhare in its honours, and feem rather inferior to the other Italians in
their genius for the arts and fciences. Rubens eflablifled his fchool at Antwerp, not at Amfterdam. Drefden, not Hamburgh, is the centre of politenefs in Germany. France has, at a former period, to fay nothing now of its prefent condition, furnifled an eminent instance of the fourifhing of learning in abfolute governments. Although it had fcarcely ever cnjuyed any eiteblifhed liberty, it has neverthelefs carried the arts and fciences as near perfeftion as any other pation. The Inglifn are perhaps greater philofophers, the Isalians better painters and muficians, the Romans were greater orators ; but the French, fays Mr. Hume, are the only people, except the Greeks, who have been at once philofophiers, pocts, oratcrs, hiltorians, painters, architects, iculptors, and muficians. With regard to the ftare, they have excelled the Grecks, who far excelled the Englih. And in common life, continues the fame author, they have, in a great meafure, perfected that art, the molt ufeful and ayrecalle of any, "l'art de vivre," the art of fociety and, comerfation. He adds, if we confider the ftate of the fciences and polite arts in our own country, Horace's obfervation, with regard to the Romans, may, in a great meafure, be applied to the Britifh.
" Manferunt, hodieque manent veftigia ruris."
It has become an eftablifhed opinion, that commerce can never flourih but in a free governmeut; and this opinion feems to be founded on a longer and iarger experience than the foregoing, with regard to the arts and fciences. If we trace commerce in its progrefs through 'Tyre, Athens, Sy racufe, Carthage, Venice, Florence, Genoa, Antwerp, Ho land, England, \&c., we fhall always find it to have fixed its feat in free governments. The three greateft trading towns in Europe now, fays Mr. Hune at the time when he wrote, are London, Amflerdam, and Hamburgh; all free cities, and proteftant cities; that is, enjoying a double liberty. Hume's Effays, vol. i. Eff. xii. and xiv. See Liberal Arts and Commence.

Liberty, Perfonal, confilts in the power of locomotion, or of changing fituation, or removing one's perfon to whatfoever place one's own inclination may direct, without imprifonment or reftraint, unlefs by due courfe of law. See Habeas Corpus, Imprisonment, and False Imprijomment.

Liberty of the Prefs. See Liberly of the Press.
Liberty of the Tongue, in the Manege, is a void fpace left in the middle of a bit, to give place to the tongue of a horfe, made by the bit's arching in the middle, and rifing towards the roof of the mouth. The bit, according to the various forms of the liberty, acquires different names; hence we fay a fratch-mouth, a Pignatell, i. $\epsilon$. with the liberty after Pignatelli's fathion, and a canon-mouth, with the liberty like a pigeon's neck.

In forging the bit, care mult be taken not to make the liberty too high, left it hurt, or at lealt tickle the palate, and make the horfe carry low. See Bits.

Liberty', in AIythology, was a goddefs both among the Greeks and Romans. Among the former the was invoked under the title Eleutheria; and by the latter fhe was called Libertas, and held ia fingular yeneration; temples, altars, and itatues, were erected in honour of this deity. A very magnificent temple was confecrated to her on mount Aventin, by Tiberius Gracchus, before which was a $f_{\text {Facious court, }}$ called atrium libertatis. The Romans alfo erected a new temple in nonour of Liberty, when Julius Crefar eftablifhed his empire over them, as if their liberty had been fecured by an event which proved fatal to it. In a medal of Brutus, Liberty is exhibited under the figure of a woman, helding in
one hatid a cap, the fymbol of liberty, and two poniards in the other, with the infeription idibvs marmis.

LIBETEN, in Geography, a town of Hungary; 54 miles E.N.E. of Leopoldtadt. N. lat. $48^{3}+7^{\prime}$. E. long. 19) $3 \%^{\circ}$.

LIBETHRA, in Arcient Geagraphy, a town of Greece, placed by Paulanias on mount. Olympus, on the fide of Macedonia. M. d'Anville places it upon the river Sus, at a fmall diftancé from Heracleum, which lay to the calt, upon the fea-coalt. This is faid to have been the town where Orpheus was born, and whence his monument was transferred to Dion by the Macedonians, when Libethra was deltroyed by an inundation of the river Sus.

LIBETHRIDES, in Mytbology, a furname given to certain nymplis which were fuppofed to inhabit near mount Libethra in Bueotia, which was diltant about 40 lladra from Coronsa; and the Libethridian fountan, in Theflaly, led the poets to call the Mules by this name. Virgil, Eclog. vii. v. 21.

LIBICI, in Ancint Geograpisy, a people of Italy, who were planted eaftward of the Salaffi, in a diftrict now called the lordfhip of Vercelli. Vercellse, or Vercelli, the capital, ftood ou the right bank of the Seflites, now Selia, between Turin and Milan. Ietimulum, above Vercellæ, was fituated at the foot of the Alps, near fome gold mines. In that retired corner, there was a grove containing a temple facred to Apollo.
LIBILITZ, in Geography, a town of Sweden, in the government of Kuopio; 55 miles E.S.E. of Kuopio.

LIBISCHAU, a town of Bohemia, in the circle of Chrudim; 13 miles N . of Chrudim.

LIBITINA, in the Roman Mythology, a goddefs which pretided over funerals. This goddefs was the fame with the Venus infera or Epithymbia of the Greeks. She had a temple at Rome, where was lodged a certain piece of money for every perfon who died, whofe name was recorded in a regilter called Libitinæ ratio. This practice was eltablifhed by Servius fullius, in order to obtain an account of the number of annual deaths in the city of Rome, and confequently the rate of increafe or decreafe of its inhabitants.

LIBITUM, in Mufic. Sometimes, in the courfe of a compofition, the Latin words ad hlitum occur, which fignify, at the pleafure of the principal performer, who is at liberty to do what he pleafes, in order to manifeft his fancy, tatte, and execution; and to return to the text of the compofer whenever he pleafes: as to the reft of the band who accompany him, they are to remain inactive, and await his return to the written melody. The difference betwen cadenza, and ad lilitum is, that a cadence, or ciofe, is terminated by a fhake, whereas an ad libitum may be allowed to the performer by the compofer, at any part of the piece he pleafes. Thefe Latin words are likewife joined to fome inftrument of accompaniment, in the title page of a work ; as at the beginning of a piece, to fay that fuch an inttrument is non obligato, or not abiolutely neceffary; as in a fymphany, when the corni, or French horns, may be difpenfed with; and in a compofition for a pianoforte, when the violin has no folo parts or paffages, that will be miffed, notice is then given by the words corni ad livitum, or " with a violin accompaniment ad libitum."

LIBLE, in Geography, a town of Bohemia, in the circle of Konigingratz; 13 miles E.S.E. of Konigingratz:

LIBOBO, a fmall ifland in the Eaft Indian fea; on the S.E. coalt of Gilolo. S. lat. $10^{\circ} 4^{\prime \prime}$. E. long. $128^{\prime 2} 5^{\prime}$.

LIBOCH, a town of Bohemia, in the circle of Leitmeritz; 14 miles S.E. of Leitmeritz.

LIBONA, in Ancient Cecouraply, a town of Spain, in Celtiberia. Pitolemy.
LibONATI, in Gcography, a town of Naples, in Principato Citra; four miles E.N.E. of Policaftro.

LIBONGO, a town of Africa, in the kingdom of Locango, on the Lufuna, near the fea; 50 miles S.S.W. of Bombi.

LIBONOTUS, in Phyfiology, one of the twelve winds of the ancients. See Wixis.

LIBORA, in Ancient Gcography, a town of Spain, in the Tarragonenfis, in the country of the Carpetaniars; lituated on the Tagus, N.E. of Augultobriga, and almoft bordering on Lufitania.
LIBOURNE, in Geography, a town of France, in the department of the Gironde, and principal place of a diltrict. The place contains 8076 , and the canton 17,370 inhabitants, on a territory of $117 \frac{1}{2}$ kiliometres, in nine communes. N. lat. $44^{\circ} 55^{\prime}$. W. long. $0^{\prime} 9^{\prime}$.
LibkA, Balance, one of the mechanical powers. See Balavef.
Libra is one of the twelve figns of the zodiac; exactly oppolite to Aries; fo called becaufe when the fun is in this fign, at the autumnal equinox, the days and niglits are equal, as if weighed in a balance.
The ftars in this conitellation, according to Ptolemy, are feventeen; Tychoten; Hevelius twenty; and Flamflead fifty-one. See Constellation.

Libra alfo denotes the anciert Roman pound, borrowed, as fome have faid, from the Sicilians, who called it litra, 2.0pos.

Mr. Pinkerton (Effay on Medals, vol. i. § 7.), though he allows that the Greek pound in Sicily was called גnise, as it was in Greece, and divided into 12 ovyraus, or ounces, and that the Roman word libra is derived from the Greek $\lambda$ niez , will not admit the as or libra, a coin, to have been deduced from a Sicilian medal. The Sicilians had a coin called $\lambda .0 \eta_{\mathrm{g}} x$, but it was of tilver, and equal to the obolus of the Eginean ftandard, ten of which conftituted the Sicilian eiskerifigove The Syracufans, it is :vell known, were the clief people of Sicily, and they were a colony from Corinth. Gronovius takes pains to prove, that the flandard of Egina was ufed at Corinth, and of courfe in Syracufe; but all the Corinthian coins now remaining are upon the Attic model, which circumItance at once confutes all his arguments; and it appears from Ariltotle, as quoted by Pollux, that the Sicilians had a money talent, or flandard, of their own. The $\lambda$ 佔 $x$, or Sicilian filver obolus, contained alfo, like the Roman primitive $a s, 12$ coyxsxs, or chalci, fo callied at firft becaufe they weighed an ounce, but afterwards becaufe twelve of them went to the filver $\lambda \eta_{\rho} x$, as twelve ounces to the pound. It
 Varro fpeaks, when he fays it was of filver; and not of the Roman libella, or as, which we may fafely fuppofe was never ftruck in that metal. For after the Punic wars, of which Sicily was the grand fcene, the Sicilian coins muft have been frequent at Rome, and the Roman in Sicily. But the Greeks, or Phoenicians, of which nations the chief towns of Sicily were colonies, never knew fuch coins as the as libralis, or any of its parts; and it is well known that the ancient colonies commonly followed the plan of their parent countries. And though it muft be granted, that the Sicilians had their own ftandard, it yet bore a refemblance of the Greek ; their $\lambda r i j^{\circ} \alpha$ being equal to the Eginean obolus,
 be fuppofed that when the Greek brafs coinage was always of: the moft minute form, they mould cois pieces of that metal weighing

## LIB

weighing a pound. Mr. Pinkerton cannot agree in opinion with thole, whottrenuoufly maintain, that the Roman filver denarius owes its origin to the Sicilian $\Delta$ enzinifor. 'I'he $\Delta$ exa $\alpha \lambda_{\text {ifgov, }}$ containing 10 入injx, or Egina oboli, would weigh about iso graius, whereas the Roman denarii do not amount to above 60 , or a third part. There feems, therefore, to be no connection between the two. Upon the whole Mr. Pinkerton is convineed, that the Romans did not derive one idea of their coinage from Sicily; but that the Sizilians had their $\lambda \hat{H}_{3} x$, divided into 12 ovyabas, from the Etrufcans; though, according to the more elegant Greek plan, they made the firlt a fmall coin in filver, and never ftruck any brals coin larger than the curxazs, or piece of an ounce weight ; if, indeed, the Sicilians had not this idea of I2 oujwas to the inigx from the Romans themfelves, which is much more probable, than that the Romans had it from Sicily. It is a further and Itron;er argument againft the opinion of the Roman coinage being copied from the Sicilian, that, though we have innumerable Sicilian coins in every cabinet, yet not one of them refembles the Roman As libralis, or its early divifions, in the very finalleft degree. This argument Mr. Pinkerton deens to be conclufive. Befides, in moft cabinets there are Etrufcan coins upon the exact feale of the As libralis, and of its feveral parts; whence it follows of courfe, that thefe, and thefe alone, muit have afforded a pattern to the primitive Roman coinage. The Etrufcaus, to whom the moft ancient brais coins found in Italy are known to belong, are more a colony from Lydia, a country to which Herodotus afcribes the firft invention of coinage. Sce Convage.

The libra was divided into twelve uncix, or ounces, and the ounce into twenty-four fcruples.

The divifions of the libra were the uncia, one-twelfth; the fextans, one-fixth ; the quadrans, one-fourth; the triens, ,one-third; the quincunx, five ounces; the femis, fix; the feptunt. , feven; the bes, eight; the dodrans, nine ; the dextans, ten; deunx, eleven; latly, the as weighed twelve ounces, or one Kbra.

Learned writers are not agreed as to the true weight of the Roman pound. Villalpandus and Greaves, relying on the congius of Vefpafian for its flandard weight, have from hence attempted to determine this intricate queftion. This Roman congius contained ten pounds weight of wine; Villalpandus foend by filling it to the narrow part of the neck, with fpuing waler, that it contained jult ten modern Roman pounds, which are equal to 52560 Troy grains. Azout filled it to the fame height, and, having weighod its contents twice, found a refult very nearly agreeing with Greaves's meafure, itated by Millet, in Phil. Tranfo vol. li. p. 790. His greater weight was 63024 Paris grains, equal to $51699 \frac{3}{8}$ Troy; his leffer, 62760 Paris grains, equal to $51482 \frac{4}{3}$ Troy. The mean between both is $51591{ }^{\mathrm{r}}$. Troy grains, which, divided by 10 , give 5159 ITO $^{\circ}$ fuch grains for the weight of the ancient Roman pound. Several objections have been made to this pound derived from the congius, which Mr. Raper, ulii infra, has collected into one view; from which he infers, that it is more probable, that this flandard fhould give too great a Roman pound, than too fmall a one. But as the relult from hence mult be uncertain, he has recourfe to the coins. Having weighed nine gold pi ces in the Pembroke collection, containing $34 \frac{1}{2}$ Roman fcruples, he found their weight to amount ta 608 Troy grains, which divided by $3+\frac{1}{2}$, give $17 \frac{18}{\frac{1}{5}}$ for the fcruple, whence the Roman pound hould weigh $5075^{\frac{1}{3}}$ grains. From fome other coins of the fame kind, a feruple appears to be $17 \frac{\pi}{2}$ grains. Inftead of this fcrupular ftandard, an-
other was introduced by Sylla; ard from the heavieft of four pieces of this ftandard, allowing thirty of them to have been coined out of the Romitn pound, its weight is found to be 50.40 graius. The flandard of forty in the pound, mentioned by Pliny, fucceeded this of Sylla, and continued to the eftablifhment of the monarchy under Augultus: and froma ten different coirs of this itandard, he deduces a mean aureus of $126 \mathrm{I}_{\mathrm{T} 7}^{\frac{8}{7}}$ grains ; and fuppoling the aureus of forty in the pound to weigh 526 Troy grains, the Roman pound muft weigh 5040. In Pliny's time forty-five aurei were Atruck out of the pound; and the mean aureus from Nero to Titus, in whofe reign Pliny died, was under 112 grains: and if the tlandard weight of the imperial auress of forty-five in the pound did not exceed 112 grains, the Roman pound will weigh 5040 grains, as it is found from the confular aureus. Soon after the reign of Alexander Severus, in whofe time the aureus came to be called folidus, the coinaze became very irregular, till Conftantine entirely modelled it anew, by coining feventy-two folidi of four fcruples out of the pound of gold. From twenty-nine of thefe folidi in the interval from Contantine to Heraclius, it appears that the mean weight is 69 grains, which, multiplied by 72 , gives but 4958 grains for the Roman pound. But if the flandard weight of this coin amounted to 70 grains, the pound will weigh 5040 , as before. If we take 5040 Troy grains for the weight of the Roman pound, the fcruple will weigh $17 \frac{1}{2}$ grains; the confular aureus 126 ; the imperial aureus 112 , and the folidus $; 0$; and the confular denarius of 84 in the pound will weigh jult 60 Troy graius. (Phil. Tranf. vol. lxi. part ii. p. 462, \&c.) The common Roman pound, till ufed at Rome, confifted of 12 ounces, of 458 grains each, equal to ose ounce avoirdupois; but the money ounce feems to have had only 420 Troy grains in the pound 5040. See farther on this fubject the articles Devarids and Miliarevsis.
The Roman libra was ufed in France for the proportions of their coin till the time of Charlemagne, or perhaps till that of Philip I. in 1093, their fols being fo proportioned, as that twenty of them are equal to the libra.
By degrees, it became a term of account ; and every thing of the value of twenty fols, was called a livere.

Libra Penfit, in our Law Books, denotes a pound of money in weight.

It was ufual, in former days, not only to tell the money, but to weigh it; becaufe many cities, lords, and bifhops, having their mints, coined money, and often very bad too ; for which reafon, though the pound confitted of twenty fhillings, they always weighed it.

LIBRARII, among the ancients, were a fort of copyifts, who tranfcribed in beautiful, or at leaft legible, characters, what had been written by the notarii in notes and abbreviatures.

LIBRARY, an edifice or apartment deftined for the placing of books; or the collection of books themfelves lodged therein. -See Book.

Some authors refer the origin of libraries to the Hebrews; and obferve, that the care thefe took for the prefervation of their facred books, and the memory of what concerned the actions of their anceftors, became an example to other nations, particularly to the Egyptians. Ofmanduas, king of Egypt, is faid to have taken the hint firft ; who, according to Diodorus, had a library built in his palace, with this infeription over the door, 世XXHE IATPEION. Nor were the Ptolenies, who reigned in the fame country, lefs curious and magnificent in books.

## LIBRARY.

The feripture allo fpeaks of a library of the kings of Perfia, Ezra, v. 17. vi. I. which fome imagine to have confifted of the hiltorians of that nation, and of memoirs of the affairs of ttate; but in effect it appears rather to have been a depofitory of laws, charters, and ordinances, of the kingss The Hebrew text calls it the boufe of : ireafures, and afterwards the boufe of the rolls, where the treafures were laid up. We may, with more juitice, call that a library, mentioned in the fecond of Efdras to have been built by Nehemiah, and in which were preferved the books of the prophets and of David, and the letters of their kings.

The firtt who erected a library at Athens, was the tyrant Pifiltratus ; and yet Strabo refers the honour of it to Ariftotle. That of Piiftratus was tranfported by Xerxes into Periia, and was afterwards brought back by Seleucus Nicanor to Athens. Long after, it was plundered by Sylla, and re-eftablihed by Hadrian. Plutarch fays, that under Eumenes there was a library at Pergamus, containing two hundred thoufand books. Tyrannion, a celebrated grammarian, contemporary with Pompey, had a library of three thowfand volumes. That of Ptolemy Philadelphus, according to A. Gellius, contained feven hundred thoufand, all in rolls, burnt by Crefar's foldiers. See Alexandrian.

Conftantine, and his fucceffors, erected a magriificent one at Conitantinople; which, in the eighth century, contained three hundred thoufand volumes, all burat by order of Leo Ifaurus: and, among the reft, one in which the Iliad and Odyfley were written in letters of gold, on the guts of a ferpent.

The molt celebrated libraries of ancient Rome, were the Ulpian, and the Palatine. They alfo boaft much of the libraries of Paulus Æemilius, who conquered Perfeus ; of Lucilius Luculus, of Afinius Pollio, Atticus, Julius Severus, Domitius, Serenus, Pamphilus Martyr, and the emperors Gordian and Trajan.

Anciently, every large church had its library ; as appears by the writings of St. Jerom, Anaftafius, and others. Pope Nicholas laid the firft foundation of that of the Vatican, in 1450. It was deftroyed by the conitable Bourbon in the facking of Rome, and reftored by pope Sixtus $V$. and has been confiderably enriched with the ruins of that of Heidelberg, plundered by count Tilly in 1622 . One of the moft complete libraries in Europe, was faid to be that ereeted at Florence by Cofmo de Medicis; over the gate whereof is written, Labor absqve labore: though it has been fince exceeded by that of the late French king ; begun by Francis I., aúgmented by cardinal Richelieu, and completed by M. Colbert.

The emperor's library at Vienna, according to Lambecius, confirts of eighty thoufand volumes, and fifteen thoufand nine hundred and forty curious medals.

The Bodieian library at Oxford, built on the foundation of that of duke Humphry, exceeds that of any univerfity in Europe, and even thofe of all the fovereigns of Europe, except the emperor's, and late French Ling's, which are each of them older by a hundred years. It was firt opened in 1602 , and has fince found a great number of benefactors; particularly fir Robert Cotton, fir H. Savil, archbifhop Laud, fir Kenelm Digby, Mr. Allen, Dr. Pococke, Mr. Selden, and others. . The Vatican, the Medicean, that of Beffarion at Venice, and thofe juft mentioned, exceed the Bodleian in Greek manufcripts ; which yet outdoes them all in Oriental manuicripts.
As to printed books, the Ambrofian at Milan, and that of Wolfenbuttle, are two of the molt famous, and yet both inferior to the Bodleian.

Library, Kimg's, at St. James's, was founded by Hensy, eldeft fon of James I. and made up partly of books, and partly of manufcripts, with many other curiofities, for the advancement of learning. it has received $n$ any additions from the libraries of Ifaac Cafaubon, and shers.

Library, Cottonian, originally confited of nine hundred and fifty-eight volumes of original charters, granss, intruments, letters of fovereign princes, tranfations between this and other kingdoms and flates, gencalogie', hillorivs, regitters of monafteries, remains of Saxon laws, the book of Genefis, thought to be the moft ancient Greek copy extant, and faid to have been writ by Origen in the fecond century, and the curious Alexandrian copy or manufcript, in Greek capitals. (See Adexandruax.) This library is kept in the Britinh Mufenn, with the large and voluable library of fir Hans Sloane, amounting to upwards of fortytwo thoufand volumes, \&c. There are many public libraries belonging to the fevrral colleges at Oxford and Cambridge, and the univerfitics in North Britain. 'The principal public libraries in London, befide that of the Mufeum, are thofe of the College of Heralds, of the College of Phyficians, of Doctor's Commons, to which every biflop, at the time of his confecration, gives at lea!t 201 . fometimes $50 \%$ for the purchafe of books; thofe of the Gray's Inn, Lincoln's Inn, Inner Temple, and Middle Teirple; that of Lambeth, founded by archbifhop Bancroft in 1610, for the ufe of fucceeding archbihhops of Canterbury, and increafed by the benefactions of archbifhops Abbot, Sheldon, Tenmifon, and Secker, and faid to confilt of, at leaft, fifteen thoufand printed books, and fix hundred and feventeen volumes in manufcript ; that of Red-Crofs threet, founded by Dr. Daniel Williams, a prefoyterian divine, and fince enriched by many private benefactions, and by an annual fum appropriated to its increafe ; that of the Royal Society, called the Arundelian or Norfolk library, becaufe the principal part of the collection formerly belonged to the family of Arundel, and was given to the fociety by Henry Howard, afterwards duke of Norfolk; in 1666; which library has been increafed by the valuable collection of Francis Afton, efq. in ${ }_{17} 75$, and is continually increafing by the numerous benefactions of the works of its learned members, and others; that of St. Paul's, of Sion Colltge, the queen's library, erected 'by queen Caroline, in 1737 ; and the furgeon's library, kept in their hall in Lincoln's Inn Fields; the Weftminfler library, the library of the Royal Intitution, incorporated in 1800 ; the library of the London Talitution, eltablifhed in 1805, thefe of the Surry Inititution and Ruffell Infitution, \&cc. \&c.

Where a library is erectel in any parifh, it thail be preferved for the ufes directed by the founder; and incumbents and minifters of parifhes, \&c. are to give fecurity for it, and make catalogucs of the books, \&c. None of the books faall bealienable, without confent of the bifhop, and then only when there is a duplicate of fuch books. If any book fhall be taken away and detained, a jultice's warrant may be iffued to fearch for, and reltore the fame: alfo, a Sion of trover may be brought in the name of the proper ordinary, \&e. And bilhops liave power to make rules and orders concerning libraries, appoint perfons to view their condition, and enquire of the ftate of them in their vifitations.. (Stat. 7 Anne, cap. 14.) . Bray's Inflitution for parochial libraries is under the direction and management of a number of affociates, a treafurer and fecretary. See the biographical article Thomas Bray.

Library, Mufical. Dr. Burney complains, in the fecond vol, of his General Hittory of Mufic, p. 44t, that in

## LIB

his travels through France, Italy, Germany, Holland, and the Netheriands, in fearch of materials for his work, he was able to tind no complete mufical library. "Something like a chain or feries of mufical theoritts (he fays) may perhaps be found at Vienna, where the emperor Leopold I. began to form a mufical library; and the elector of Bavaria another at Munich in the feventeenth century. But both have been long neglected, and are now in a very confufed and inperfect ftate. Nor is a complete feries of mulical compofitions by the beft mafters, from the carlieft period of counterpoint to the prefent time, to be found in any public or private library in Europe, to which I have ever had accefs. Indeed the collectors of books for royal, collegiate, or public librarics, feem never to have had an idea of forming any regular plan for making fuch a collection; and though many individuals have been poffeffed of a rage for accumulating mufical curiofities, it has feldom happened that they have extended their ideas to mufical productions in general; fo that no more than one clafs or fpecies of compolition has been completed by them, and even this, at the death of the proprietor, is ufually difperfed.
"In a library, formed upon fo large a fcale as that of the king of France at Paris, the Bodleian, and Mufeum in England, it feems as if mufic fhould be put on a level with other arts and fciences, in which every book of character is procured. In a royal or ample collection of pictures, fpecimens at lealt of every great painter are purchafed, and no private library is thought complete while the writings of a lingle poet of eminence are wanting."

As the author, in a note upon this paffage has given a fketch of fuch a mufical library as he thinks wanting, and which has been inferted in the Ecyclopódie Methodique, we fhall give it a place here, in his own words.

In forming fuch a mufical library as would affift the ftudent, gratify the curious, inform the hittorian, and afford a comparative view of the flate of the art at every period of its exiftence, it were to be wifhed that the books, when collected, were claffed in a way fomewhat like the following:
\(\left.\left.$$
\begin{array}{l}\text { Maffes } \\
\left.\begin{array}{l}\text { Motets } \\
\text { Madrigals } \\
\begin{array}{c}\text { Songs in parts, } \\
\text { and fingle fongs }\end{array}\end{array}\right\} \text { to Latin words, }\end{array}
$$\right\} \begin{array}{l}In modern lan. <br>

guages,\end{array}\right\}\)| From the infancy |
| :--- |
| of counterpoint to |
| the year 1500. |

The fame continued to the year 1600 ; to which floould be added:
Services and full anthems
Verfe and folo anthems Pfalmody, in two or more parts

The fame claffes completed to the year 1700, with the addition of mafques, intermezzi, ferenatas,

Operas, ferious and comic.
Oiatorius.
Cantatas.
Fantalias and Recercari, for various inftruments.
All the above continued to the prefent time, with an ad-
tien of full ditien of full

## LIB

Sonatas, or trios, ducts, and
Solos for every inftrument for which mufic lias been eome pofed, including voluntaries for the organ, and leffons for every fpecies of keyed inftrument.
The mufic publifhed in fingle parts fhould be fcored, and that publifhed in partition tranfcribed, in fingle parts; to be alike ready for the eye or the ear, for the theorift to exa. mine, or the practical mulician to perform.
And in order that fcience and criticifm may keep pace with the mechanifm and practice of the art, all the treatifes, tracts, and eflays, both in the dead and living languages, flould be collected, arranged chronologically, and afligned a particular portion of the library.

The Bodleian library, the Mufcum, and Royal Society, with fome other libraries, have copies of new books fent to them, by the Stationers' company, and by individuals either by law or by courtefy; and when once fuch a foundation of old mufic is laid as we have here fletched out, it would foon become a cuftom, or might be made one by the legillature, for copies of all mufic that is publifhed in England, as well as books on the fubject, to be prefented by the authors or editors to the public library. And the fame means mould be ufed for procuring all foreign mufieal publications as are employed in accumulating books from all parts of the globe, where the prefs is at work.
The librarian, cuflode, or kecper of thefe books, fhould be a good practical mufician, as weil as theorift and fcholar, in order to know the worth of the productions he has in charge, and to be enabled to give inftructions at lealt how to draw fingle parts from a fcore, and fcore fingle parts; to explain difficulties to the ignorant, and difplay curiofities to the learned; to know the rank each compofer fhould hold in every clafs, and perhaps record the degree of refpect that has been paid to him by his contemporaries, and which is due to him from polterity.
LibratA Terre, a portion of ground, containing four oxgangs, and every oxgang thirteen acres.

It was anciently fo much land as was yearly worth 20 . and in Henry III.'s time, he that had quindecim libratas terra, was to receive the order of knighthood.

Some fay, that as money is divided into pounds, fhillings, pence, and farthings, the fame degrees are to be obferved in the divifion of laads; and, therefore, as quadrans fignifies a farthing, fo quadrantata is the fourth part of an acre ; obolata, an half; denaricta, a whole acre; folidata, 12 acres; and librata, 20 times 12 acres; i. e. 240 acres.

This is the fame with what in Scotland is called pound-land of old extent.

LIBRATION of the Moon, in Affronomy. Few perfons are unacquainted with the remarkable circumftance, that the moon always prefents nearly the fame face to the earth. Sometimes, however, we fee rather more of the eaftern, and fometimes rather more of the weftern hemifphere than at other times. The fame occafional variation is likewife obfervable in the north and fouth hemifpheres. This fenfible ofcillation, partly real and partly apparent, is called the libration of the moon.

Galiteo was the firft aftronomer who obferved and attempted to explain the libration of the moon; his explanation was, however, very imperfect, not being aware that the moft confiderable part of the libration arifes from the unequal motion of the moon in its orbit, as was firft difcovered by Hevelius in $165+$ Laplace gires the following popular explanation of the aftronomical appearances connected with the libration. For the phyfical explanation the reader is re-
ferred to a memoir of Lagrange (Memoires de l'Academie). which obtained the prize in 1764 , and likewife to the Berlin Memoirs, 17 M 0 , in which the lame author has inveftigated this fubject at great length.

To form a juit idea of the principal caufes of this phenomenon, we thould conlider the difk of the moon, when feen from the centre of the earth, as terminated by a great circle of the lunar glube, perpendicular to its radius vector (a line joining the centres of the earth and moon); on the plane of this great circle, that hemifiphere of the moon which is prefented to the earth is projected, and the various appearances of this hemifpheye are connected with the rotatory motion of the moon on its axis. If this motion did not exit, its radius vector would trace a great circle on its furface, every part of which would be fuccefively turned towards us, during every lunar revolution. But at the fame time that the radius vector would defcribe this circumference, the moon, by its revolution, brings very nearly the fame point of its furface to the radius, and confequently turns the fame hemifphere towards the earth. The inequalities in the moon's motion produce fome flight variation in the appearance of this hemifphere; for as the motion of rotation does not partake perceptibly of thefe inequalities, it is sariable with refpect to the radius vector, which thus in terfects its furface at different points. The lunar globe, therefore, makes, with refpect to this radius, ofcillations correfponding to the inequalities of its motion, which caufe fome part of its furface to be alternately concealed, and expofed to our obfervation.

This libration, referred to the ecliptic, is called the libration in longitude. But the moon has another libration in latitude perpendicular to this, and by which the parts near the poles of the axis of rotation of this globe alternately appear and difappear. To comprehend this phenomenon, let us fuppofe the axis of rotation to be perpendicular to the ecliptic. When the moon is in its afcending node, thefe two poles will be at the northern and fouthern extremity of the vifible hemifphere. In proportion as the moon is raifed above the ecliptic, the northern pole and the parts furrounding it will difappear, while the regions near the fouth pole will become more and more vifible, till the moon, having arrived at its greatelt northern latitude, will return again towards the ecliptic. Thefe phenomena will then be reproduced in the reverfe order; and when the moon, having reached its defcending, node, paffes below the ecliptic, the north pole will prefent the fame phenomena as the fouthern one had offered.

The axis of rotation of the moon is not always perpendicular to the ecliptic, and its inclination produces appearances which may be underftood by fuppofing the moon to move upon the plane of the ecliptic, fo that its axis Thould always remain parallel to itfelf; it is obvious that then each pole will be vifible during half a revolution of the moon round the earth, and invifible during the other half, fo that the regions which furround them will be alternately vifible and in. vifible.

And laftly, the obferver is not at the centre of the earth but at the furface. It is the vifual ray drawn from his eye to the centre of the moon, which determines the middle of the vifible hemifphere, and it is clear shat from the effect of the lunar parallax, this radius cuts the furface of the moon at different points, according to its height above the horizon.

All thefe caufes produce only an apparent libration of the lunar globe; they are mére optical illufions, and do not affect its real motion of rotation; it is neverthelefs true, that this rotation may be fubject to fome fmall irregularities, but they have not yet been detected by obfervation.

VoL. XX.

It is not the fame with the inequalities of the lunar equator. In endeavouring to deternine its pofition by obfervations of fpots on the moon, Donimique Caffini was led to this remarkabe refuit, which contains all the attronomical theory of the real libration of the moon. If we conceive a plane to pafs through the centre of the moon, jicro pendicular to its axis of rotation, which plane will coincide with that of the equator; if, moreover, we imagine a fecond plane parallel to that of the ecliptic, and a third plane, which is the mean plane of the lunar orbit, thefe three plates will always have a commor interfection. The fesurei plane, fituated between the two others, forms with the firit an angle of about $1^{\circ} 30^{\prime} 10^{\prime \prime}$, and with the fecond, an angle of $5^{\circ} 8^{\prime} 49^{\prime \prime}$. Thus the interfections of the Junar orbit with the ecliptic or its nodes, always coincide with the mean nodes of the lunar orbit, and, like them, have a retrograle motion, whofe period is $18^{y} 223^{3} 7^{n} 13^{\prime} 17^{\prime \prime} \cdot 7$. In this interval the two poles of the equator and of the lunar orbit defcribe fmall circles parallel to the ecliptic, in fuch a manner, that thefe three poles are conitantly fituated on a great circle of the beavenly fphere.
Libiation of the Earth, is a term applied by fome aftronomers to that motion, whereby the earth is fo retained in its orbit, as that its axis continues conftantly paraliel to the axis of the world. See Parallelism.

This Copernicus calls the motion of filration; and may be illuftrated thus: Suppofe a globe, with its axis parallel to that of the earth, painted on the flag of a maft, moveable on its axis, and conitantly driven by an calt wind, while it fails round an ifland; it is evident, the painted globe will be fo librated, as that its axis will be parallel to that of the world, in every fituation of the fihip.

LIBSHAUSEN, in Geography, a town of Bohemia, in the circle of Leitmeritz; 15 miles S.W. of Leitmeritz.

LIBUN, a town of Bohemia, in the circle of Bolellaw; 16 miles N.E. of Jung-Buntzel.

LIBURNIA, in Ancient Geography, a province of Illyria, along the Adriatic fea, over-againtt Italy, between Dalmatia on the fouth, and Iftria on the north. This peninfula runs into the fea between the rivers Tedanius and Titius, now the Zermague and Kerka, the latter of which was in the Reman times the boundary between Liburnia and Dalmatia. Zara, anciently Jadera, and afterwards Diadora, was once the capital of Liburnia. The ruins of Burnum, the Liburnia of Strabo, are to be feen on the right hand of the Titius, or Kerka, in the defert of Bukoviza.
Liburnii, or Liburnians, the denomination of one of the three nations which fprang from the Illyrians, having left the country which bore their name in Illyria. They were probably the firft people who penetrated into Italy by its northern part, about the fixteenth century before the Chriftian era, and in procefs of time fettled along the fea-coaft. In Italy they were divided into three branches, wiz. the Apuli, the Pxdiculi, or Padicli, and the Calabri. The country which they inhabited was called Apulia by the Ro. mans, or Japygia by the Greeks.

LIBYA, the name anciently given to that part of the world called Africa (which fee), comprehending in its whole extent Egypt, Marmarica, Cyrenaica, the. Syrtic region, Libya proper, Numidja, Mauritania, Libya or Africa interior, Ethiopia, \&c.; and bounded on the N. by the Mediterranean, on the E. by the ifthmus of Suez, the Red fea or the Arabian gulf, and the Eaftern ocean ; on the S. by the Ethiopian fea ; and on the W. by the Atlantic fea. In a more reltricted fenfe, the name has been ap. plied to that divifion of Libya or Africa called. "Li-

## I I C

bya Interior," which lay weftwards with regard to the other divilicn of P'tolemy denominated Ethiopia fub Aigypto. The line of divifion between thefe two parts, marked by this geographer, paffes through Darnis, a city on the confines of Cyrenaica. In this weftern part, called Libya interior, the inhabitants confilted chiefly of the Gxtuli, Garamantes, Nigritx, and Hefperian Ethiopians, befides many other people, lefs confiderable and lefs known. See Geetulia, Garamantes, and Ethiopia.

Libys, a town of Hifpania'interior. Anton. Itin.
Libya Palus, a lake of Africa, properly fo called. Ptolerny.

LIDYARCHE, a people of Africa, in Libya, and more particularly in Marmarica, of which they occupied the northerm part. Ptolemy.

LIBYCUMMARE, or fea of Libya, a name given by the ancients to part of the Mediterrancan fea, which adjoined the coaft of the Marrotide Libya; bounded on the W. by the fea of Africa, and on the E. by the fea of Egypt.

LIBYCUS Moxs, a mountain of Egypt, near the city. of Thebes. The Nile ran between this mountain and the sacred mountain.

LIBYPH ENICES, a name given by fome authors to the Phoenician colonies eftablifhed in Africa, in contradiftinction to the Syro-phernicians, or the Phenicians of Afia.

LIBYSSA, a maritime town of Afia, in Bithynia, fituated between Chalcedonia and Numidia. It was the place of Hannibal's retreat for avoiding the hatred of the Romans.

LICANIA, in Botany, Aublet. Guian. 119. t. 45. See Hedscrea.

LICAVO, in Geograppy, a town of the ifland of Cor. fica; 20 miles E . of Ajazzo.

LICE. See Louse.
Lice of trees. See Aphis.
LICEA, in Botany, a genus of Furgi, Schrad. Nov. Gen. 16. Perf. Syn. 195, the fpecies of which have been, fome of them, referred to Trichia, Spherocarpus, (not the true Sphurocarpus of Micheli, which belongs to the order of Alga), and Didymium. Its charaster is thus given by Perioon.

Peridium, (or cafe, ) naked, roundih, or fomewhat indeterminate in fhape, brittle. Internal membrane wanting. Seminal pozeder deftitute of fibres.

The ipecies he enumerates are five, all very minute productions, fcarcely bigger than pins' heads, found chiefly on rotten wrond of the fir kird.
I. L. bicolor, the firlf fpecies, (Didymium parietinum; Schrad. Nov. Gen. 24- t. 6. f. 1.) is fingular for being found on white-wafhed mud walls. Its outer cafe is dark olive, enclofing a quantity of bright yellow powder, which, according to Schrader's generic character of Didymium, fhonld be intermixed with fibres. Within is amother, much fnaller, brown, likewife globular, rather hard and rough cafe, full of a coarfer brown powder.
2. L. circumfcifor (Spherocarpus feffilis; Bulliard t. 417. f. 5.), is brown and cluttered, opening by a circular divifion. Found in authinn or winter, between the bark and wood of the Afpen-tree.
3. L puflla, Schrad. Nov. Gen. 19. t. 6. f. 4, is hemiPpherical, polifhed, chefnut-coloured, with a blackifh powder.
4. L. varialifis, ibid. 1S. t. 6. f. 5, 6, is varions in fyare and colour, reddifh-brown; the powder dirty yllow.
5. L. flexuofa, is defcribed by Perfoon as creeping or

## LIC

oblong, fhining red brown, fomewhat wavy, with faw like incifions. Thefe three laft are found on fir wood.

Some of Schrader's fpecies are removed by Perfoon to other genera. Albertini and Schweiniz, in their Confpectus Fungorum, have defcribed two new fpecies.
L. flrobilina, n. 303. t. 6. f. 3, found on the inner fides of the feales of cones of Pinus Picea, growing regularly in clutters, brown, with a dull yellow powder.
L. incarnata, n. 304.t. 10.f. 6, obferved once only, on rotten fir wood in a moilt foreft, the beginning of October. It is crowded, flefh-coloured with a fteely glofs ; the powder at firlt white, then flefl-coloured, finally deep rofecoloured.

Licence, Licentia, in Law, a power or authority given to another to do fome lawful act.

A licence is a perfonal power, and cannot be transferred to another; though a licence may be granted to a man and his affigns. ( $x_{2}$ Hen. VII. 25.) There may be a parol licence, as well as by deed in writing; but if it be not for a certain time, it paffes no intereft. (2 Nelf. Abr. 1123.) By licence a man may practife phyfic and furgery in Lundon: licences are allo neceffary for carrying on various trades and profeffions, on which a duty is laid, for the purpofe of raifing a revenue to government. If a Ieffor licenfe his leffee (who is reftrained by covenant from aliening without licence) to alien; and fuch leflor dies before he aliens, this is no countermand of the licence: fo it is if the leffor grants over his eftate. (Cro. Jac. 133.) But where a lord of a manor for life granteth a copyhold tenant to alien, and dieth, the licence is deftroyed, and the power of alienation ceafeth. ( 1 Init. 52.) Copyhold tenants lealing their copyhold for a longer time than one year, are to have a licence for it; or they incur a forfeiture of their eftates. (I Init. 63.) If any licence is given to a perfon, and he abufes it, he fhall be adjudged a trefpafer ab initio. 8 Rep. 146.

Licence to alien in mortmain. Alienations in mortma in to ecclefiatical perfons, \&c. are reftrained by feveral ftatutes; but the king may grant licence to any perfon or bodics politic, \&c. to alien or hold lands in mortmain. 27 Ed. I. 7 \& 8 W . III. cap. 37.
Licence is alfo ufed, in the Civil Lawv, for a permifion or leave granted by a fuperior.

Juftinian appointed four years to be fpent in the fudy of the law ; after which, thofe who had difcharged this obligation, were faid to have licence or permifion to retire from fludy.

Licence is alfo applied to the letters, or certificates, taken out in univerfities, whether in law, phyfic, or divinity.

Licence in the Sorbonne, denotes a period of two years, which the bachelors are obliged to pafs in affilting at acts, and difputing in them, to qualify themfelves for being admitted doctors. See Degree.
Licence, letter of. See Letter.
Licence to arije, in Law, Licentia furgendi, is a liberty, or fpace of time given by the court to 2 tenant, who is effoined de malo lecti in a real action, to rife out of bis bed, and go about his bufinefs.

Licence for elecion of biblops. See Conge d'Elire.
Licence of marriage. Bilhops have power to grant licences for this purpofe; and parfons marrying any perfon without publifhing the banns of matrimony, or without licence, incur a forfeiture of rool. \&cc. by 7 \& 8 W. III. cap. 35. See alfo flat. 26 Geo. 1I. c. 33. See Marariage.

Licence, in Painting, are the liberties which the painter
takes in diipenfing with the rules of perfective, and the other laws of this art.

Licence, poctical, is the liberty which poets claim of dif. penfing with the ordinary rules of grammar.

Anciently poets had much greater licences than are now allowed. The Greeks, by having recourfe to the feveral dialects of their tongue, could lengthen out a word, if it were too flort, or retrench fomething from it, if it were too long. The old poets did what they pleafed with their language, and fubjected it not only to all their neceffities, but their caprices too:

> "Et data Romanis venia eft indigna poetis."

But thefe became ridiculous in courfe of time; and the poets are now defpoiled of molt of their ancient privileges.
Licence, in Mufic, a feeming breach of rule.
There are licences in harmony as well as in melody. As the laws of counterpoint were at firft arbitrary, and formed of narrow and contracted principles, they became fubject to change at the caprice or tafte of the compofer, and at all times, the breach of an old rule by a great nalter became the eftablifhment of a new one for a compofer of inferior fame. At prefent, except the two fundamental prohibitions of two 5 ths and two 8 ths in regular progreffion, there is no rule that has not been happily infriaged, at one time or other, by fome man of genius; fo that it may be faid, perhaps, that whatever does not offend a cultivated ear in harmony or melody, is allowable in mufic. Of the difallowances of former times; there was none that feemed fo inviolable as falfe relation, fuch as naturals againft fharps, or fharps againft naturats: in the perfect concords, as a redundant 5 th, a diminifhed 4 th, or a falfe octave. Yet thefe licences, of late years, have been fo frequently practifed, as almoft to eftablifh them into rules. The good or bad efict determines the expediency.

If the effect be good, it is a licence, if bad, a faulto. Emanuel Bach, we believe, was the firit who ventured to hazard a falle 8th, or a farp. againft a natural in melody. But Haydn and Mozart having fince frequently violated the rule with effect, it almoft ceafes to be a licence, and every fonatteur in compofition affumes the fame privilege. Thefe licences, however, can only be defended on the principle of appogriaturas, as they are certainly inharmonic.

Lícensed Curate. See Curate.
Licensing of Books. See Liberty of the Preess, and
Printing.
Licentia Concordandr, in Law, is that licence for which the king's filver is paid in paffing a fine, mentioned in 12 Car. II. cap. 12.

Licentia loquendi. See Emparlance.
Licentia transfretandi, a writ or warrant directed to the keeper of the port of Dover, or other feaport, commanding them to let fuch perfons pafs over fea, who have obtained the king's licence for the purpofe. Reg. Orig. 193.

Licentiate, or Licenciate, he who has obtained the degree of a licence.

Molt of the officers of judicature in Spain are known by no other name than that of licentiates. To pafs licentiate in the common law, civil law, or phyfic, they mult have fludied feven years ; in divinity, ter.

Licentiate, among us, is ufually underfood of a phyfician, who has a licence to practife, granted him by the College of Phyficians, or by the bilhop of the diocefe.

A perfon practiting phytic withous fuch licence, in cafe
his patient dics under his hands, is guilty of felony in the eye of the law.

LICETO, Fortunio, in Biography, a celebrated phy-: fician and philofopher, was borin at Rapallo, in the itate of Genoa, on the 3d of of October, 1577, where his faw ther, Jofeph Liceto, was alfo a phyfician. His education was conducted with great care, and he afterwards fpent four years in ftudy at Bologna, which he quitted in 1599. He then futtled at Pifa, where he foon obtained the profefforflhip of philofophy, which he filled with fo much reputation, that he was invited to the fame chair in the univerfity of Padua in 1609, which he occupied until 1636. He removed at that time to Bologna, in confequence of failing to obtain the profeflorfhip of medicine, which became vacant by the death of. Cremonini. But the Venetian Itates very foon perceived, and acknowledged the lofs which the univerfity of Padua had fultained by the retirement of Liceto; and when a vacancy occurred in the firtt chair of the theory of phyfic in 1645 , he was induced, by the preffing invitations which were made to him, to return to Padua, where he held the profeflorfhip, at an advanced falary, till his death in 165\%. He was a very copious writer, having publifhed upwards of fifty treatifes upon medical, moral, philofophical, antiquarian, and hifterical fubjects; but they are no longer fufficiently interefting to require a detail of their titles. He was a man of confiderable erudition, and an ardent admirer of the doctrines of Ariftotle; but difplayed little acutenefs in refearch or originality of conception. He wrote a treatife "De Lucernis Antiquorum reconditis," in which he maintains the opinion, that the ancients were poffeffed of a fecret procefs for making inconfumable lamps, by fome mode of condenfing the vapour into oil, which returned to the refervoir, and was extremely credulous in refpect to the pretended difcoveries of fepulchral lamps of this fort. But his opinions were pofitively refuted by profeffor Ferrari of Padua, in a treatife, "De veterum lucernis fepulchralibus." Among his medical writings, his treatife, "De Monftrorum Caufis, Naturâ, et Differentiis," is beft known; but it is replete with inflances of credulity, and with the fables and fuperftitions of his predecefiors, and contains a claffification of the monfters, which had been previoufly defcribed, without any correction from his own obfervations. The belt edition is that of Gerard Blafius, in 1668. Eloy Dict. Hilt. Gen. Biog.

LICH, in Geography, a town of Gersany, in the principality of Hohen-Solms, on the Wetter; 12 miles E.S.E. of Wetzlar. No lat. $50^{\circ} 3 \mathrm{I}^{\prime}$. E. long. $8^{3} 49^{\prime}$.
LI.CHAN, a town of Corea; 17 miles E.S.E. of Het-fin.

LICHANOS, in the Ancient Muyfic, is the name of the 3 d found of the two loweft tetrachords in the fyftern of the Greeks; as this found was produced by the index or forefinger, which was called licbanos.. The 3 d found of the loweft tetrachord afcending, was that of the bypate, and called lichanos-hypaton, fometimes hypaton-diatonos, enharmonic, or chromatic, according to the genus. That of the 2d, or mean tetrachord, was called lichanos-meforo or Mefon diatonos.
LICHEN, in Botany, $\lambda_{\text {anx }}=1$, a name borrowed by the Romans from the Greeks for the difeafe called a tetter, or ringworm, and applied by both to fome plant of a moffy nature, growing on ftones, which was thought a cure for fuch complaints. What the Lichen of the ancients may have been is very obfcure, and the enquiry is given up by

Dilleuius

## L. ICHEN.

Dillenius himfelf in defpair. He lass applied this name to the Marchantiu of other writers, under which he comprehends the very diftinet genera of Targionia, Riccia and Sphosrocarpus ; fee his b. 78. Linneus much more happily adopts the Lichen of Tournefort and Micheli, whofe crultaceons and fcurfy nature, in many inflances, is affociated with the original idea of the word. This Dillenius terms Lichenoides, from which he dittinguifhes Coralloides and Ufinca, but all three are comprehended in the Linuzan Lichcn.-Linn. Gen. 566. Schreb. 767. Mart. Mill. Dict. v. 3. Hudf. 523. Juff. 7. Tourn. t. 325. Mich. Gen. t. 36-53. Hedw. Theor. 120. t. 30, 3 1. Lamarck. Hluftr. t. 878. (Lichenoides; Dill. Mufc. 12+. t. 18-30. Coralloides; ibid. 75. t. 14-17. Ufnea; ibid. 56.t. 11-13.)-Clafs and order, Cryptogamia Alya. Nat. Ord. Alyes Linn. Juff.

Eff. Ch. Male, fcattered powdery warts ?-Female, fhields or tubercles, in whofe diik the feeds are lodged.

Obf. Linnxus takes for male what are now known to be the female flowers, and, vice ver $/ \hat{a}$, takes for the female thofe powdery heads, warts or fillures in the frond, which are by fome thought buds, by others the male blofioms. We have therefore ventured to reverfe his character of this valt genus, which properly embraces an entire natural order. (See Lichenes.) It is neceffary however here to give a compendious view of Lichen, as undertood by Linnxus. The fpecies defined in the 14th edition of his Syflema $V$ egetabilium amount to 130; but the infufficiency of this catalogue, to comprize all the Lichens in the world, will be ftrikingly evident, when we confider that about 345 Britifh Species have already appeared in Englifh Botany, and that feveral more remain to be publifhed there. We fhall on this occafion prefer illuftrating the nine fections, into which Linnæus has divided his genus, by fpecies of his own, rather than by new ones. Molt of thefe exilt in his herbarium, few or none of them being adopted from Dillenius or other cryptogamits, which cannot fo generally be faid of the Linnæan proper Mufci.

Sect. I. Leprofi tubercslati. Twenty-one fpecies.
Thefe confitt of a leprous perennial cruft, of more or lefs denfity, hardnefs and fmoothnefs, its furface often granulated, fometimes powdery, of various colours, (white, grey, greenifh, or yellowih,) in different fpecies; the internal fubttance however is generally very white, often with a green ftratum immediately below the actual furface. This etuft fpreads circularly, with more or lefs regularity, over ftones, rocks, earth, the bark of trees, or even dead wood, to which it frequently adheres fo ftrongly, that, being moreover in fome cafes very thin, it cannot be feparated entire. Fibrous roots, of the cartilaginous or chalky fubftance of the cruft, may be detected in fpecies that grow upon uneven bodies, or on the ground. The circumference or border of the cruft is always thin; often marked with a dark-coloured line; occafionally beautifully fibrous and branched. The central part firit decays, and finally crumbles away, young plants, of the fame or a different fpecies, foon afterwards fpringing up there from feed; while the marginal boundary of the original cruft, if its fituation be convenient for the purpofe, is fometimes extended to ten times its ufual limits.

The cruft of the thicker or tartareous fpecies, more efpecially, is liable to affume a red or purplifh hue, from the accefs of volatile alkali; which is feen when certain animal fubitances fall upon thefe plants in their native fituations. The obfervation of this has led to the ufe of fome of them in dyeng; but feveral of the next and following fections are preferable for this purpofe.-The female fruct.
fication, or rather the fruit itfelf, of this firf fection; is, or onght to be, convex, without any border ; except in a young flate, when there is ufually a thin margin of its own fubftance. The difk is moft frequently black, in fome brown, pale grey, or reddifh; and in its folid internal fubitance are innumerable, vertical, clofed cells, each containing about cight minute feeds. It may be obferved that the increafing convexity of this difk feems well calculated to allow room for the fwelling of the feeds; and finally, by feparating or expanding the cells, to promote the efcape of their contents. The fubjacent cruft, under each tubercle, is elevated into its core or centre, fo as to form a nucleus there.- Difcoveries fubfequent to the time of Linnxus have found this fection to be rather heterogeneous, as to the affinities of the feveral kinds, as will be explained hereafter. (See Licinenes.) Our purpofe is now merely to indicate the molt remarkable fecies, for the elucidation of our author.
L. fcriptus. Syft. Veg. ed. 14. n. I. Linn. Sp. Pl. 1606. (Lichenoides crultâ tenuiflimâ, peregrinis velut literis infcripta; Dill. Mufc. 128.t. 18. f. I. Opegrapha fcripta; Engl, Bot. t. 1813.)-Leprous, whitifh, bearing fmall, black, branched, letter-like lines. - Common on the fmooth bark of young trees. The $c r u / t$ is a fine, infeparable, whitifh film. The fructification conveys an idea of Hebrew or Chinefe writing, in a very ftriking manner. This plant however, as underftood by Linnzus, Dillenius, and moft of their followers till lately, embraces at lealt 30 known fpecies, together conftituting a moft natural and diftinct genus, of which we fhall fpeak hereafter more than once, under the name of Opegrapba.
L. geographicus. n. 2. Sp. Pl. 1607. Engl. Bot. t. $245 \cdot$ (Lichenoides nigro-flavum, tabulx geographicx inftar pictum; Dill. Mufc. 126. t. 18. f. 5.)-Leprous, yellowifh, with black lines refembling a map. - Frequent on the hard rocks of mountainous countries, and almoit as hard itfelf, at lealt to the touch, forming broad infeparable patches, of a vivid greenifh-yellow, or lemon-colour, curioufly Atreaked and dotted with black marks, compofed of the tubercles, which are flat, not elevated above the cruff, frequently confluent or crowded.

Of this fpecies, atrovirens, $n .3$, is thought to be a variety, or rather an early ftage of its growth.
L. fanguinarius. n. 9. Sp. Pl. 1607. Engl. Bot. t. 155. (Verzucaria fanguinaria; Hoffm. Pl. Lich. t. 41: f. I.)Cruft tartareous, white, polifhed, uneven. Tubercles black, without a border; bright red within.--Found on granite rocks; copioully upon Cromford Moor, Derbyfhire ; very rarely on the rugged barks of trees. This is extremely rémarkable for the internal ftains of bright red, perceived when the tubercles, and even fome parts of the crufl, are broken; which refembling blood, gave occalion to the very apt name. Several fpecies, deflitute of that property, and which otherwife but imperfectly refemble this, are confounded with it by Linnæus, Hudfon, Lightfoot, and others.
L. ventofus. n. 1\%. Sp. Pl. 1607 . Engl. Bot. t. 906. (L. cruentus; Web. Goett. 184. t. 1. L. flavefeens ; Jacq. Mifc. v. 2.79. t. 9. f. 1. L. gelidus ; Hudf. 528. Lichenoides tartareum lividum, fcutellis rufis, margine exili; Dill. Mufc. 133. t. 18. f. I4.)-Crult tartareous, rugged, pale fulphur-coloured. Shields irregular, a little fwelling, bloodred, with a narrow pale border. - Found on large expofed granite or fand-ftones, in mountainous places, forming patches as broad as the hand, eafily pared from the rock when moit. The cruft is of an elegant pale lemon or fulphur-colour, turning white the fecond year, but in either cafe it is ftrikingly contrafled with the crimfon/biclds. Thefe having a permanent border, of a different fubiltance and

## LI C HEN.

cotour from their dilk, are foields, not tubercles, fo that the -plant belongs properly to the fecond fection of its genus, of which we flall next give a few examples, and to which it is referred by Murray in Syft. Veg.ed. If, under Jacquin's name of fluvefcens, fo that it occurs twice in that edition.
$\mathrm{S}=\mathrm{Ct} .2$. Leproff futellati. Twelve fpecies.
The cruft of thefe is almoft univerfally tartarcous, fometimes very thick, lefs hard than in feveral of the former, and more eafily feparable from the ftones or bricks on which it may happen to grow. The effential difference refides in the fructification, which conlitts of flattin fhields, or, as Dildenius terms them, faucers, whofe elevated permanent margin is of the fubtance and colour of the cruft, not of the dik.
L. tartareus, n. 25. Sp. Pl. 1608. Engl. Bot. t. 156. (Lichenoides cruftaceum et leprofum, acetabulis majoribus luteis, limbis argenteis; Dill. Mufc. 132.t. 18. f. 13.)Crult tartareous, rugged, granulated, whitifh. Shields tawny bulf-coloured, with a white margin. -The largett of the crultaceous Lichens; very frequent upon rocks in the north, and important as an article of commerce. The diameter of the cruft is fix, eight or ten inches, and its thicknefs a quarter or half an inch. The /bields are frequently half an inch wide, confpicuous for their full buff colour, and white, fmooth, wavy border. This fpecies is much ufed in dyeing, being fcraped from the rocks when fully grown, which is about the fifth year of its age, and mixed with volatile alkali and alum. It is fold to the dyers in the form of a purple powder, called Cudbear, which being boiled with woollen yarn, communicates any flade of its own colour that may be delired, but does not dye vegetable fubitances. This colour is by no means permanent, being far inferior, in that refpect, to what is given by the Orchall of the Levant, Licben Roccella.
L. frigidus. n. 24. Swartz Meth. Mufc. 36. t. 2. f. 4 . Engl. Bot. t. 1879, found on the Scottifh mountains, is pretty generally believed to be a mere variety of tartareus, with a thinner cruft; but it feems to differ in throwing out תlender branched briltly proceffes, not found in the former.
L. Perellus. n. 32. Linn. Mant. 132. Engl. Bot. t. 727 , is like tartarcus on a fmaller fcale, with 乃ieields of the fame white colour as the crufl, and is ufed likewife for dyeing purplifh colours, chiefly in the fouth of France.
L. upfalienfis, n. 33. Sp?: P1. 1609. Engl. Bot. t. 1634, differs from Perellus as frigidus does from tartareus, in having flender awl-fhaped brifles protruded from the crult.
L. fubfuftus. n.-30. Sp. Pl. 1609. Engl. Bot. t. 2109. (Lichenoides cruftaceum et leprofum, [cutellis fubfufcis; Dill. Mufe. 134. t. 18. f. 16.)-Crult thin, continued, fmoothilh, brownih-white. Shields feffile, flightly convex, reddifh-brown, with a tumid, whitifh, entire border.-This is one of the thinneft, and ufually leaft tartareous, of the prefent fection, and is very common every where on the fmooth barks of trees, being diltinguifhed by its copious, bay or chefnut /bields, whofe white fmooth border renders them confpicuous. Their difk is fometimes curioufly prolifcrous, which happens alfo in tartareus. Sometimes it is parti-coloured, or mixed with a pale waxy hue, as if withered or abortive there. Numerous fpecies greatly refemble this, but have been diftinguifhed from it and from each other, generally very fuccefffully, by the acutenefs of the learned profeflor Acharius and others.

In this fame fection Limmeus places his candelarius, fee Engl. Bot. t. 1794, but improperly; doubtlefs from his having, at ous time or other ${ }_{3}$ confounded with it, as others
have done, the vitellinus of authors, Engl. Bot. t. 1792, and citrinus, t 1793. Thefe are all yellow in their crufl or frond, as well as the Joields of their margins; and ferve to give a golden colour to candles, ufed on fetival days in the Swedifle churches, by being mixed with the melted wax or tallow.

Some of this fection have a lobed, though not eafily feparable, crult, as lintigerus, n. 29. Engl. Bot. t. 871 ; and geclidus, t. 699 . The true /bields of the latter, whofe difk is of a fine pink colour, were not known to Limnaus, who miftook for the fructification of this rare fpecies certain brown warts, or proliferous excrefcences of the cruft, which he termed pelta; fee his Mantifa, 133. Having neverthelefs true fhields, it properly belongs to this fecond fection. L. mufcorum, n. 3 I. Engl. Bot. t. G26, on the contrary, having only a black and evanefcent border to its black convex tuberkles, thould have been placed in the firt.

Sect. 3. Imbricati. Thirteen Ipecies.
The plants of this fection do not confit of an adherent cruft, but approach more or lefs to a leafy ftructure, being either of a membranous, cartilaginous or gelatinous texture. The fegments fpread from a centre, lying over one another like tiles, the central ones being moft divided and elevated, the marginal part more depreffed, rather plaited than deeply cut, and moft dilated outwards. The two fides differ remarkably ; the upper being ufually either pitted, wrinkled, warty, or befprinkled with mealy cracks, but deftitute of hairs, and frequently polifhed, varioufly coloured; the under opaque, fometimes pale or white, fometimes quite black, always befet with innumerable fibrous perpendicular radicles, by which it is firmly attached to the bark, wood, earth or ftones on which the plants grow. The fhields are horizontal, fcattered over the upper furface, to which they are attached chiefly by their central part. Their border is of the fubllance and colour of the frond; the dik fomewhat deeper in hue, and much inclined to a chefnut or tawny caft. The mealy warts or cracks in the upper fide of the frond are prefumed to be the male bloffoms, becaufe no other are known. This is a mifcellaneous and unnatural combination of fpecies, as will be explained under the next fection.
L. centrifugus. n. 34. Sp. Pl. 1609. Fl. Lapp. ed. z! 357 n. $44^{8 .}$ t. 11 . f. 2.-Imbricated, membranous; green-in-white and fmooth above; white, with brownifh fibres, beneath: fegments linear, divaricated, bluntifh. Shields fcattered towards the circumference, reddifh-brown, with an inflexed, almoft entire, burder.-This is, according to Linnæus, extremely common on large ftones throughout Lapland, where Lichens that grow on flones are more rare than in other places. It is of all others moft remarkable for its centrifugal mode of growth, forming circles a foot or two in diameter, and indeed fometimes, as we are told, eight or ten feet, confifting of a whitifh band two or three inches broad, while the central part is quite decayed and obliterated. Linnaus errs in citing under this a fynonym of Dil. lenius, t . ${ }^{24}$. f . 75 , which is the con/perfus of Acharius and Engl. Bot. t. 2097, a fpecies found in various parts of Europe, of a more compact manner of growth and greener colour, with" broader lobes and larger, concave, dark chefo nut flields.
L. favatilis. n. 35. Engl. Bot. t. 603; and omphalodes, n. 36. Engl. Bot. t. 604 ; are of a more lax and leafy habit than the laft, as well as different in colour. The former of them is very common; the latter confined to mountainous rocky heaths or moors. Both are ufed to dye browns or dull reds in the ruder ftates of human fociet $\%$, or among at the inhabitants of the alps.
L. garietinus. n. 43. Sp. Pl. 1650. Engl. Bot.t. 194. (Lichenoides
(Lichenoides vulgare finuofum, foliis et fcutellis lutei? ; Dill. Mufc. 180. t. 24 . f. 76.) Imbricated, membranous, Ateliated, roundly lobed and crifped, orange-coloured ; pale and fibrous bencath. Shields of the fame colour, with a thin entire border.-One of the moit common of its genus, very confpicuous on old walls, as well as on rocks, wooden buildings, trees and buthes. Its rich golden colour is molt vivid in expofed fituations; affuming an olive, greenifh, or greyinh calt in the thade and damp. Several fpecies however are perhaps confounded under this by Linnæus and his followers.
L. Acllaris, n. 45 Sp. Pl. 1611 . Engt. Bot. t. $169{ }^{2}$, coloured too green.-" Imbricated; leaflets oblong, laciniated, narrow, afh-coloured. Shields brown." Linn.Very common on trees. Under this a great number of Ipecies are undoubtedly confounded by Linnæus, though Acharius may poffibly have gone too far in dividing them. Some are green when wet; others continue grey, whether moift or dry. The fbields in all of them are of a greyihblack, not verging towards red, and are ufually plentifully produced.

Sect. 7. Foliatei. Twenty-fix fpecies.
What Linneus refers to this fection are all naturally allied to one or other fpecies of the laft, fo that the two fections ought to form but one, there of the prefent being only more leafy, leîs imbricated, and in fome cafes quite erect. Nothing however can be more mifcellaneous than this divifion of the genus.
L. Burgeffii, n. 48. Lightf. Scot. 827. t. 26. Engl. Bet. t. 300.-Gelatinous, membranous, crifped and fringed, of a dark glaucous grees. Shrelds deprefied, dark brown, with a leafy, crifped, elevated border.-Found on the trunks of old trees in Scutland and Wales. One of the moft elegant of its tribe, conlilting of dark-green patches as broad as the hand, of delicate pellucid curled and wavy leaves, bearing numerous fizelds, very remarkable on account of their leafy, complicated, wreath-like borders. L. ornatus, ${ }^{n}$. 71, is the very fame fpecies. When dry the whole frond becomes more opaque, verging towards a lead colour. This belongs to a tribe called gelatinous Lichens, which conftitute a very natural genus, now named Coltema. All agree in their peculiar dark-green colour, femi-pellucid pulpy texture, and reddifh or tawny-olive, generally fmall, fhields. Some of them are placed by Limmeus in the former fection, others in this.
L. cillaris. n. 49. Sp. Pl. IGrı. Engl. Bot. t. 1352; is of the fame natural fami y as flcllaris of the laft order; only larger, more lax, and remarkably fringed.
L. caperatus. n. $65 . \mathrm{Sp}$. Pl. 1614. Engl. Bot.t. 654 ; is in like manner allied to faxatilis, \&c. and is properly an imbricated fpecies.
L. iflandicus. n. 50. Sp. Pl. 161 1. Engl. Bot. t. 1330. Fl. Dan. t. 155. Hoffm. Pl. Lich. t. 9. f. I; is celebrated as a reftorative medicine in confumptive complaints. This with the three following of this fection, nivalis, n. 5 1. Engl. Bot. t. 1994 ; juniperinus, n. $6_{4}$. Hoffin. Pl. Lich. t. 7. f. 2 ; and glaucus, n. 67 . Engl. Bot. t. 1606 , all elegant fpecies, form a natural affemblage, which Acharius has feparated, with fome others, under the generic name Cetraria. See Lichenes.
L. ampullaceus. n. 54. Sp. Pl. r6ı3. (Lichenoides tinctorium glabrum veliculofum; Dill. Mufc. s88.t. 24. f. 82.), fee Hoffm. Pl. Lich. t. 13. f. 2. is only a morbid variety of the laft, glaucus, caufed apparently by the wound of fome infect, which produces a fort of gall. The original fpecimen of this, having been folen by a foreigner, more curious than honeit, from the Dillerian herbarium about thirty or
thirty five years ago, was detected by the late profeffor Sib. thorp when abroad, in this perfon's collection, and recovered. It is not however reftored to its original place, where the figure only is now found. But this is of the lefs confequence, as Mr. Menzies has gathered the plant in the very fame ftate, which has been diffected in our prefence, and its importance as a fpecics thus falls to the ground. By the manner in which the hiltory of this Lichen is related by our friend Mr. Turner, Tr. of Linn. Soc. v. 7. 112, it might feem that the excellent profeffor Von Jacquin was the thief, from which we think it effential to exculpate him, ner did Mr. Turner mean to imply any fuch thing.

To the fection in queition belong feveral fpecies of a very diftinct tribe, named $P$ bygcia by Acharius (but fince funk in his Parmelia, the above Cetrarie being feparated from it), of which the following are examples.
L. farinaceus. n. 56. Sp. Pl. 1613. Engl. Bot. t. 889. (Licheneides fegmentis argutioribus, ad margines verrucolis et pulverulentis; Dill. Mufc. 1/22. t. 23.f.63.)-Leafy, much-branched, upright, leathery, glaucous-alh-coloured, froooth, pitted; the branches tapering, ftudded with lateral, convex, pale, mealy warts. Shields icattered, italked, fat, pale-buff.-Common on trees, but the תhields are extremely rare, whence L. fafligiatus, Ach. Prod. 175. Engl. Bot. t. Sgo, came to be taken for the fame thing. Its very abundant fhields are nearly of the greenifh-white hue of the frond, and the mealy warts are wanting:
L. fraxineus. n. 61. Sp. Pl. 1G14. Engl. Bot. t, 1781, is fo common on trees, confificuous for its large fize, and lanceolate figure, that nothing need be faid of it.
L. fuciformis. n. 61. Sp. Pl. 1614. Engl. Bot. 728. (Lichenoides fuciforme tinctorium, corniculis longioribus et acutioribus; Dill. Mufc. 168. t. 22, 23. f. GI.)-Leafy, divided, pointed, flat, nearly upright, tapering at each end, greyih-white, obfcurely downy, with white mealy warts. Shields convex, blackifh.-This is found on granite rocks upon the Cornifh coalt, but more plentifully in the Mediterranean, the Canary iflands, and the Eaft Indies, in which laft climate it grows to the length of a foot. It is extremely important as an article of commerce, being ufed irdifcriminately with, and according to fome preferred to, the famous L. Roccella, for dyeing. See féction 8.

Sect. 5• Coriacei. Thirteen fpecies.
This is in itelf a very natural fection, but Linnzus has referred to it one or two fpecies totally foreign to the nature of the reit; as perlatus, n. 82. Engl. Bot. t. 34 1. (Lichenoides glaucum perlatum, fubtùs nigrum et cirrofum ; Dill. Mufc. 147. t. 20. f. 39.)-This is in habit, texture, and natural affinity, clofely -allied to faxatilis, in fect. 3.L. aquaticus, n. 73. Sp. Pl. 1615 ; for which a fynonym of Dillenius, t. 20. f. 44, is quoted with doubt, has always been involved in much obfcurity. The plant of Dillenius is perforat:s of Jacquin and others, well figured in Hoffm. Pl. Lich. t. 13. f. 1. That of Linuæus, preferved in his herbarium, is faid in the Flora Suecica to have been found in moffy boggy places at Norrby, near Upfal, his own country refidence ; but no one has ever difcovered what was meant. On a careful examination of the fecimen, it proves to be
L. corrugatus. Sm. Tr. of Linn. Sac. v. 1. 83. Engl. Bot. t. 1652. Ach. Prodr. 122. (Lichenoides acetabulis cutaneis et rugofis; Dill. Mufc. 185. t. 24. f. 79.), a plant found on trees throughout Europe, though long neglected by Linnxan botanifts, fome of the molt diftinguifhed of whom have mittaken it for divaceus.

The real coriaceous Lichens, which conflitute this fifth feation, are, as their denumination inplies, of a tough ked-

## LICHEN.

thery testure; fmoothifh above; firongly veined and bearing numerous coarfe radicles beneath. 'Their fhields, called pelte, or targets, are peculiar, perfectly feffile, and as it were glued to the frond towards its margin, fometimes at its under fide! They are oblong or kidney-flaped, often flightly convex ; their border merely a thin film which, in a tender ftate, cavers their dikk, and finally recedes to the edge as it withers. The plants of this fection mollly grow on the ground, either at the roots of trees, or on fhady mofly banks.
L. refupinatus. n. 74. Sp. Pl. 1615 . Engl. Bot. t. 305. (Lichenoides fufcum, peltis polticis ferrugineis ; Dill. Mufc. 206. t. 28. f. 105.)-Coriaceous, creeping, lobed, brownifhgrey. 'Targets oblong, at the under lide of each fmall afcending lobe.-Native of moilt fhady rocks, or of the molfy roots of trees in mountainous countries. The fronds are imbricated, fmooth, of a dull brownifh lead-colour, compofing broad depreffed patches; the targets reddilh-brown, concave, plentifully produced, but each folitary at the concave extremity of its own fmall lube.
L. ardicus. n. 77, and antarticus. n. 78, both one fpecies, are united by Acharius under the name of Pctfidea polaris, being found in very high northern or fouthern latitudes only. They are remarkable for the great fize of their targets, which grow at the back of the greenilh-white frond, and are as big as the thumb-uail, orbicular, of a dark livid flefh-colour.
L. caninus. n. 79. Sp. Pl. 1616. Engl. Bot. t. 2299. (Lichenoides digitatum cinereum, lactucæ foliis finuotis; Dill. Mufe. 200. t. 2\%. f. 102.)-Coriaceous, dilated, afcending, furrowed, grey; white, with brown veins and fibres beneath; lobes very broad, with marginal fruit-bearing proceffes. Targets in front, vertical, revolute, roundifh, red-brown, with a pale border. The largeft, moft common, and moft famous of its tribe, being the celebrated "Afh-coloured Ground Liverwort," fo extolled by Dr. Mead as a cure for the bite of a mad dog, whence the alove fpecific name. It was given with black pepper in milk, the patient being firlt bled, and afterwards bathed in cold water; but whatever accidental circumitances might confirm that famed phyfician in his opinion, the medicine has long been entirely laid afide.
L. factatus. n. 83. Sp. Pl. 1616. Engl. Bot. t. 288. (Lichenoides lichenis facie, peltis acetabulis immerfis; Dill. Mufc. 221.t. 30. f. 12 I.)-Slightly coriaceous, roundifh, creeping ; green above; white beneath. Targets fcattered, blackifh, funk in pits. Found on the ground among rocks in mountainous countries.
L. croceus. n. 84. Sp. Pl. 1616. Fl. Lapp. t. 11. f. 3. Engl. Bot. t. ${ }^{4} 0^{8 .}$ (Lichenoides fubtùs croceus, peltis appreflis; Dill. Mufc. 221. t. 30 f. 120.)-Coriaceous, creeping, rounded at the extremities ; green abdve ; orange and veiny beneath. Targets fcattered, brown, flat.-Found only in the molt alpine fituations, near the limits of perpetual fnow, growing on the ground. -Thefe two laft, elegant and rare productionso are not exactly of the habit of the reft. Acharius, in Schrader's New Journal, v. I. fafc. 3. 20, 21, has referred them to his new genus Artbonia (fee Lichenes); from the true fecies of which they differ in their leafy, not cruftaceous, habit, nor is it eafy to fay to what family they properly belong.

Sect. 6. Umbilicati. Eleven fpecies.
A mort diftinct and natural tribe, conflituting the genus Gyrophora of Acharius, of which we have fpoken in its proper place. (See Gyropiora.) Linnæus defines thefe plants as umbilicated, or attached by their centre, and dirty as it were with foot. The latter perhaps may be their male
warts. The fruit exhibits the moft effential charafter in the concentric folds obfervable in its difk. The firft fpecies however, miniatus, n. 86. Engl. Bot. t. 393, though it agrees with the rett in its umbilicated habit, differs from them in fructification, in which latter refpect it accords with Endocarpon; fee that article. True Gyrophore are
L. velleus. n. 87. Sp. Pl. 1617 . (Lichenoides coriaceum, latiffimo folio umbilicato et verrucofo ; Dill. Mufc. $545^{\circ}$ t. 82. f. 5.)-Umbilicated, talked, dilated, wavy ; brown-ifh-grey and fmooth above; covered beneath with black, branched, crowded fibres. Tubercles cluftered, flat.-Native of rocks in Lapland and North America. Often as broad as both the hands, tough and leathery, remarkable for its denfe, black, hairy clothing beneath. In this laft refpect indced it accords with the much fmaller, green or olivecoloured, Britifh pellifus, Engl. Bot. t. 931, which Hudfon mittook for vellcus.
L. Puffulatus. n. 88. Sp. Pl. 161\%. We need not repeat what is laid of this under the article Gyropmora.
L. viridis. n. 96. Linn. Suppl. 451, gathered at the Cape of Good Hope by Thunberg, is Endocarpon Thunbergii, Ach. Meth. I29, has ncthing of the character of a Gyrophora.

Sect. 7. Scyphbiferi. Nine fpccies.
The natural family of cup-bearing Lichens, or pyxidati; being one of the mett diftinct and Atrongly characterized, has been feparated as a genus of iifelf by moft who have confidered the fubject. (See Lichenes.) The fpecies are extremely confufed and difficult to define, being variable in themfelves and much refembling each other. Their frond or bafis confifts of fmall, rounded, more or lefs difperfed, horizontal fcales, or leaflets; fmooth and green or greyih above ; pure white beneath, as well as at the edges and withinfide. In fome few inftances they are dilated, and: lobed or pinnatifid. From thefe arife upright falks, terminating in a cup-fhaped figure, of a large proportion compared with the leaflets, of a greenilh-grey colour, and mealy or fcaly furface; the edges of the cup producing the fructification, which confifts of fmall globular tubercles, either brown, or of a moft beautiful fcarlet, feffile, or varioully ftalked. Sometimes the cup is proliferous from its edges or centre; fometimes obfolete, or, as it were, ftarved. Thefe plants come under the Coralloides of Dillenius, t . 14, 15.-Examples are
L. cocciferus. n. 97. Sp. Pl. 1618. Engl. Bot. t. 205 r. (Coralloides fcyphiforme, tuberculis coccineis ; Dill. Muic. 82. t. 4. f. 7.)-Cup-haped, leathery, pale greenifh-grey, mealy. Cups dilated, fomewhat toothed. Tubercles fungous, fearlet. Leaves minute, lobed and crenate.-A beautiful fpecies, not uncommon in woods, or on heaths; among ling, or in various dry fandy places. The large fcarlet tubercles render it very confpicuous. Several other fpecies indeed have the fame-coloured fructification, but. fmaller, and they differ in other refpects. The cups in this are fhorter, broader, and more perfect than in any other with fcarlet tubercles.
L. pyxiliatus. n. 99. Sp. Pl. 16i9. Engl. Bot. t. 1393. (Coralloides fcyphitorme, tuberculis fufcis; Dill. Mufc. 79 . t. 14. f. 6.)-Cup-fhaped, leathery, greyih-green, fcaly, often proliferous. Cups dilated, nearly entire. Tubercles brown. Leaves ninute, imbricated, crenate. - The moft common of this tribe, occurring every where, in broad patches, on heaths, fandy banks, and under hedges. Its cup-like fhape is ufually pretty regular, at leaft before the tubercles appear; but the edges of the cup, or its centre, occationally throw up otbers, even to four or five ranks or
flages $_{3}$

## LICHEN.

Aages, one upon another, in beautiful luxuriance. More frequently the firlt cup bears unequal and imperfect cups, or tubular tenlki, crowned with the brown tubercles. The flulks of all are frequently deafy or fcaly, efpecially their lower part.
L. gracilis, n. ro1. Sp. Pl. 161 . Engl. Bot. t. 1284. (Coralioides ferphiforme ferratum elatius, caulibus gracilibus glabris; Dill. Mufc. 88. t. I4. F. 13.)-Cup-fhaped, long, llender, fmooth, cartilaginous, greenifh-brown; at Iength fomewhat branched. Cups conical, fharply toothed. Tubercles brown. Leaves minute. - In heathy dry mountainous places, or in woods, in the north, not unfrequent. The character of this is widely different from the two preceding, difplayed in its brown hue, tall flevder form, and fharp teeth or terminal branches. The tubircles are dark brown. Leaves very minute, and frequentiy obliterated.
L. flammeus. n. 105. Limn. Suppl. 451 . Hoffm. Pl. Lich. t. 3.f. I.; is very improperly referved to this fection by Murray, merely, as it feems, on account of its tubular ftem and branches. It ought, according to the Linnman arrangement, to ftand in fection 3, after parietinus, n. 43, and before pbyfodes, n. 44, agrecing with the former in colour, with the satter fomewhat in firucture. We mean not, however, to fay there is any confiderable real affinity between thefe three fpecies.

Sect. 8. Fruticulofo. Ten fpecies.
A vague fection, comprifing, though fmall, feveral dif. cordant things, of which no general definition can be given, except that they are of an upright bufhy habit.
L. rangiferinus. n. 1o6. Sp. Pl. 1620. Engl. Bot. t. 173 . (Coralloides montanum, fruticuli fpecie, ubique candicans; Dill. Muic 107. t. 16. f. 29 ; et corniculis rufefcentifus; zio. t. I6. f. 30.)-Buhy, tubular, very much branched, white and hoary; the little branches divaricated and drooping. Tubercles terminal, globofe, molly cluftered, dark brown. - This is the Reindeer Lichen, fo celebrated by Linnæus, in his Flora Lapponica and Lapland Tour, as the food of that animal. In the wide heathy tracts and forelts of thofe northern regions, it covers the ground like frow, rifing to the height of a foot or more; with us it is much humbler and more difperfed; always choofing the molt fterile heathy foil, and not very generally producing fruit. Its texture is thin and brittle, foft to the grafp of the hand, and excellent for package, the only ufe for which it can ferve in this climate. The branches are occafionally, not always, perforated at their divarications. The furface is hoary, or rough with minute warts. Tubercles very fmall, terminal, abundant when they occur at all.
L. uncialis. n. 107. Sp. Pl. 1621. Engl. Bot. t. 174.
L. vermicularis. n. so8. Swartz Meth. Mufc. 37. Engl. Bot. t. 2029 .
L. fubulatus. n. 109. Sp. Pl. 162I. (Coralloides corniculis longioribus et rarioribus; Dill. Mufc. 102. t. 16. f. 26.)

Thefe three are naturally akin to rangiferinus. The following are very different.
L. globiferus. n. 1 10. Mant. 133. Engl. Bot. t. 115. (Coralloides cupreffiforme, capitulis globofis; Dill. Mufc. 317. t. 17. f. 35 .)-Shrubby, folid, much branched, cylindrical, brownih and polifhed; branches with minute divaricated terminations. Fruit globular, fmoothifh, enclofing a ball of black powder.-This very pretty coral-like production occurs on monntainous rocky heaths, or in dry ftony woods. Its ficins compofe loofe entangled tufts, of a tawny light polifhed brown, and are white and folid within; the ultimate branches are innumerable, fhort, flender, tufted, and divaricated. The fruaification is altogether different
from every thing we have hitherto defcribed, confifting of terminal folitary balls, the fize of a vetch feed. fmooth, of the fubftance of the item, opening by a wide irregular perforation at the top, and containing a globular mals of black condenfed powder, prefumed to be the feeds. This plant therefore, by its fructification and habit, has every right to conititute a dillinct genus, and is now, with the two following, admitted as fuch by the name of Spharophorono See Lichenes.
L. fragilis. n. 113 . Fl. Suec. ed. 2. 425. Fl. Lapp. n. 44. i. 11. f. 4. (Coralloides fragile; Hoffm. Pl. Lich. 34 t. 33. f. 3. Splxxophoron fragile; Ach. Meth. 135. t. 3. f. 5 )-Shrubhy, folid, brittle, afhy brown; brarches level-copped, cy lindrical, crowded, naked. Fruit globular, rugofe, enclofing a ball of black powder.-Found in fimilar places with the laft, with which moft botanitts, in Britain and elfewhere, have confounded it, taking the following for the true fragilis.

L comprefus. (L fragilis; Ach. Prodr. 2 II. Hudf. 558. Engl. Bot. t. 114. L. melanocarpus; Swartz Prodr. 147. Spharophoron compreffim; Ach. Meth. 135. Coralloides alpinum, coraihnæ minoris facie; Dill. Mufc. 116. t. 17. f. 34.)- Shrubty, folid, cartilaginous, white, branched, conipreffed; branches ciuftered, fomewhat palmate Fruit depreffed, containing a cake of black powder.-The moit elegant of this new genus, remarkable for its white corallike appearance, laving the fplendour of porcelain when frefh. The above characters mark it fufficiently. The fruit is rare, produced in moilt flady fituations only. This. fpecies feems to prefor line tlone rathr rihan granite rocko.

To a very different famely belongs
L pafchalis. n. 11F. Sy. Pl 1621. Engl. Bot. t. 282. (Coralloider crifpum et betryforme alpinum; Dill. Mufc. 114. t. 17. f. 33.) Shrubby, folid, clothed with minute cruflaceous leaves. Tubercles terminal, prominert, brown. -This Lichen, found on incecenus alpine rocks, is dettined to perform an inportant office in the economy of nature, being the firf vegetable that takes ro t upon liva, whofe porous furface will admit no crattaceous fpecies, Thus it compofes in decaying a portion of vegretable mould, fit for the reception of the feeds of othir plan's. Its rocts and Aem are very tough and ftrong, and the affen blage of minute greyilh-brown leaves, that cover the whole, gives it a peculiar and diftinct afpect. The tubercles are folid, white within, convex, without any border.

Three fpecies only remain, having little or no affinity to any of the above, or to each other.
L. trifis. n. 112. Web. Goett. t. 5. Swartz. Meth. Mufc. 37. Engl. Bot. t. 720. This alpine Lichen has real fhieids. It occurs anong the imbricated fpecies, by Jacquin's name of rigidus, n. 42 ; and it is curious that Murray, the editor, has quoted in both places the fame fynonym of Haller, n. 1966. t. 47. f. 1.
L. verrucofus. n. 114. Suppl. 451. (Stereocaulon tabulare; Ach. Meth. 316. to 7. f. 3.)-Found at the Cape of Good Hope: It confifts of denfe, broad, white tufts of low branched falks, tumid and globole at their fummits, and agrees altogether in genus, very nearly in fpecies, with Mr. Dickfôn's oculatus, Engl. Bot. t. 1833. Yet profeffor Acharius confiders the fructification of verrucofus as unknown, and refers the plant to his genus Stereocaulon, of which pafohalis, n. 11x, above-mentioned, is a genuine example.
L. Roccella. n. 115. Sp. Pl 1622. Engl. Bot. t. 11 1. (Coralloides corniculatum fafciculare tinctorium, fuci teretis facie ; Dill. Mufc. 120. t. 17* f. 39 )-This we have mentioned in Speaking of tartareus, n. 25 , and fucijormis, n. 61 It

## LICHEN.

It agrees very much with the latter, except in being cylindrical, and lefs foft or flexible, and their thields are exactly alike. - A Cape variety, as it is thought to be, of Rocrella, is partly cylindrical, partly flat, and much dilated.

Sect. 9. Filamzntofi. Fifteen fpecies.
A very curious, thriking, and, for the moit part, very natural aflemblage. Many of them hang in long, black, grey, or white cluiters, from the branches of aged pines, oaks, or chefnuts, in alpine forefts, to which they give a fingular and romartic afpect. Their fronds are filamentous, often a foot or more in length, repeatedly branched, cither folid, or apparently jointed, in a beard-like manner, with a central tough fibre; fometimes they are compreffed, fometimes pitted ; in one nondefcript fpecies exquifitely reticulated like lace. The fructification is various and uncertain; in fome perfect frields with a true difk, and a border like the frond; in others a fpurious kind of thield, orbillus, is found, along with coloured feed bearing tubercles; in others, again, powdery warts only are difcoverable.

A few examples will fuffice.
L. plicatus. n. IIG. Sp. Pl. 1622. Engl. Bot. t. 257. (Ufnea vulgaris, loris longis implexis; Dill. Mufc. 56. t. II. f. I.)-Filamentous, cylindrical, pendulous, whitifh; branches entangled. Shields (fpurious) whitifh-green, radiated. Tubercles yellowifh.-Found in ancient woods. The fionds are exceffively and finely branched, a foot or two long, pendent in denfe clufters from the trees. Their furface is minutely warty. The proper tubercles, defcribed by Acharius, we have never feen. The fpurious fbields, his orbilli, are rare. The latter are improperly made reddifh in Englifh Botany.
L. divaricatus. n. I19. Syit. Nat. ed. 12. v. 2. 713. (Ufnea mollis, ramis longis compreffis; Dill. Mufc. 62. t. 12. f. 5. U. flaccida; Hoffm. Pl. Lich. t. 67.) - Filamentous, pendulous, angular, jointed, pale fulphur-coloured; branches divaricated. Shields feffile, chefnut-coloured, with a narrow border of the fubftance of the frond. - Native of fir woods on the alps of Savoy, Switzerland, \&c. Often a foot and a half long, foft and flexible, confpicuous for its yellowifh hue. The fbields are thofe of an Acharian Parmelic. See Lichenes.
L. aurantiaco-ater. n. 128. Jacq. Miic. 369. t. 11. f. 2, (very badly drawn,) feems to us allo a true Parmelia, though retained in UJfrea by Acharius; fee his Methodus, 307.
L. capenfis. n. 130. Suppl. 45 I . (Ufnea capenfis; Hoffin. Pl. Lich. t. 10. f. I.) is properly referred by Acharius to his Parmelia.
L. floridus. n. 129. Sp. Pl. 1624. Engl. Bot. t. 872. Ehrh. Crypt. 148. Ufnea vulgatifima tenuior et brevior, cum orbiculis; Dill. Mufc. 69. t. 13. f. 13.)-Filamentous, with a central thread, bufhy, erect, greenifh-grey; branches round, fibrous, warty, with radiated fpurious fhields. Tubercles on the branches, "lateral, flefh-coloured, rugged. -Not uncommon on dead branches of oaks in old woods, but the orbilli feldom occur except on the higher trees, and the real tubercles are extremely rare. The latter were fuppoled to have been publifhed for the firt time in Engl. Bot. vol. xiii. in 1801, but the celebrated Schrader appears to have defcribed though not figured them two years earlier. They are conformable to what have long been known in other genuine fpecies of this tribe. We cannot but think L. birius, n. 125 , Engl. Bot. t. I354, fpecifically diftinct from floridus, of which profeffor Acharius makes it a variety. The zubcrcles of birfus grow chiefly on the ftem or large branches, which are continued ftraight beyond them, not ftrongly bent backwards, as in floridus. Thefe fpecies VoL. XX.
boiled with wool, without alum, dye it of a rich tawny yellow.

The moft minute fpecies of this great genus, or natural order, hold a much more important place in the economy of nature than is apparent to fuperficial obfervers. They are the firt beginning of vegetation on ftones of all kinds expofed to the air, whofe decompofing furfaces are the receptacle of their imperceptible feeds, and foon afford nourifhment to the fprouting plants, whofe minute fibrous roots ftill further infinuate themfelves. The larger fpecies take poffeffion of every cavity and fiffure, both of ftones and the decaying external bark of trees. In time they all decay, and furnifh a portion of regetable mould, capable of nourifhing mofles, or Atill larger plants. The refiduum of thefe, being ftill more confiderable, is wafhed by rains into larger cavities, where even forelt trees can fcatter their feeds, by the penetrating power of whofe roots, great maffes are difodged from the moit lofty rocks. Thus the vegetable kingdom exercifes dominion over the tributary foffil world, and, in its turn, affords the fame no lefs neceffary aid to animal exiftence. Nothing in nature is allowed to remain ftationary, idle, or ufelefs, and the moft inconfiderable agents frequently appear, in the hands of Divine Providence, to be the moll irre. fittible. S.

Licuess, in the Materia Medica. The Lichen iflandiciss is a rative of Britain, particularly on the mountains of Wrales and Scotland. In Iceland this is ufed as focd. For this purpofe, a difh of it is prepared by chopping it fmall, boiling it in three or four fucceffive portions of water to take off its natural bitternefs, and then for an hour or two in milk. When cold this preparation has the form of a jelly, which is eaten with milk or cream, and makes a very palatable difh. The medicinal qualities of this lichen have of late been fo well eftablifhed at Vienna, that the plant is admitted into the Materia Medica of the Edinburgh Pharmacopeia, and into the London Pharmacopeia of the year 1809. It is extremely mucilaginous, and to the tafte fomewhat bitter and aftringent; but its bitternefe, as well as the purgative quality which it manifelts in its recent ftate, are in a great meafure diffipated by drying, or, as we have already obferved, may be extracted by infufion in water. An ounce of this lichen boiled a quarter of an hour in a pint of water, yielded feven ounces of a mucilage as thick as that procured by the folution of one part of gum arabic in three pints of water. Lord Dundonald (Phil. Mag. vol. x.) has given the following directions fir preparing the mucilage from the lichen. The lichen hâs an outer k in, covering a green refinous fubfance; and the remainder of the plant confilts chiefly of gum and of filrous matter, on which water does not act. In order to feparate the outer fkin from the refinous matter, the plant mult be fcalded two or three times with boiling water, which caules the fkin to crack, fwell, and peel off. It is then putinic a boiler with about three quarts of water for every pourd of the plant, and about half an ounce of potaih or foda, and the boiling fhould be continued till the liquor accuires a confiderable degree of gummy confitence. The liquor is then to be taken out and ftrained from the pian., and frefh water added to the fame material, for the purpofe of further exhaulting the gum. 'The feveral liquors, after ftanding fome hours to fettle, and then remuvi:g the dre ${ }_{2} s$, are to be boiled down in a regulated heat to the confiltence which is required for ufe, but not further, lidt it fhould burn and become coloured. Two or three boll n: $s$ will be neceflary for entirely exhaufting the lichen of its mucilage.

The medical virtues of this lichen were probably firf $+R$
leurned

## LICHEN.

learned from the Icelanders, who employ it in its fref ftate as a laxative; but deprived of this quality and properly prepared, it is faid to be an efficacious remedy in confumptions, coughs, dyfenteries, and diarrhoeas. Dr. Crichton informs us (Med. Journ. vol. x.), that during a refidence of feven months at Vienna, he had frequent opportunities of feeing the lichen iflandicus tried in phthifis pulmonalis at the General Hofpital, and he confeffes, "that it by no means anfivered the expectation he had formed of it." He adds, however, "from what I have feen, I am fully convinced in my own mind, that there are only two fpecies of this difeafe, when this fort of lichen promifes a cure. The two fpecies I hint at, are the phthifis bemoptaica, and the phothifis pituitofa, or mucofa. In feveral cafes of thefe I have feen the patients fo far get better of their complaints, as to be difmiffed the hofpital cured; but whether they remained long fo or not, I cannot take upon me to fay." That this lichen ftrengthens the digeftive powers, and proves extremely nutritious, there can be no doubt; but the great medicinal efficacy attributed to it at Vienna will not readily, fays Dr. Woodville, be credited at London. It is commonly given in the form of a decoction, an ounce and a half of the lichen being boiled in a quart of milk. Of this a tea-cup full is directed to be drank frequently in the courfe of the day. If milk difagree with the ftomach, a fimple decoction of the lichen in water is to be ufed. Care fhould be taken to boil it over a flow fire, and not longer than a quarter of an hour. In the London Pharmacopeia the decoction is directed to be prepared by boiling down an ounce of the lichen in a pint and a half of water to a pint, and then ftraining it.

The lichen caninus, or cincreus terrefris, which grows on heaths, dry paftures, and woods, has a weak faint fmell, and a fharpifh tafte. It was for a long time extolled as a medicine of fingular virtue in preventing and curing that dreadful diforder which is produced by the bite of rabid animals. The " pulvis antilyflus," a powder compofed of equal parts of this lichen and black pepper, was firt recommended as a prefervative againft the rabies canina by Mr. Dampier, brother of the celebrated circumnavigator, and by the authority of fir Hans Sloane, is was publifhed in the Philofophical Tranfactions, (vol. xx. p. 49.) The quantity of pepper having been found to render the medicine too hot, the powder was afterwards prepared of two parts of the lichen and one of pepper. This powder was afterwards adopted in the London Pharmacopeia in 1721, at the defire of Dr. Mead, who feems to have had repeated experience of its good effects, and who declares that he had never known it to fail, where it had been ufed, with the affiltance of cold-bathing, before the hydrophobia came on. He directs the patient to be blooded to the extent of nine or ten ounces; afterwards a dram and a half of the powder is to be taken in the morning fafting, in half a pint of cow's milk warm, for four mornings fucceffively. After thefe four dofes are taken, the patient is directed to go into the cold-bath every morning for a month, and then three times a week for a fortnight longer. On the character of Mead, the pulvis antilyflus was long retaincd in the London Pharmacopeia; but on the revifion of that book in 1788, it was defervedly expunged. Woodv. Med. Bot. See Antilyssus Pulvis.

Lichen, in Medicine, a cutaneous eruption, confifting of papule (pimples), affecting adults, connected with internal diforder, and ufually terminating in fcurf. It is not contagious.

Such is the character of an eruption, to which Dr. Willan has appropriated the term lichen, in his valuable treatife
on cutaneous diforders. (Order i. Genus ii.) In the writings of Hippocrates, he remarks, the term lichen, or lichenes, ( $\lambda_{\epsilon 6 \chi \text { nves, }}$ ) is employed to exprefs an eruption of papulx, and he did not include under that appellation any puftular difeafe. There is, however, an extreme confufion, as in the cafe of almoft every other denomination of cutaneous affections, among the fubfequent writers, in the acceptation of the word. The later Greek authors extend the application of it, fo as to comprehend a puftular affection of the face, fometimes called fycofis, and likewife the mentagra, a contagious difeafe, together with the fimple and
 1. xx . cap. 1.) feems to ufe the term lichen as fynonimous with the impetigo of the Latins: he is, however, inconfilent with himfelf in other places. The only author to whom we can refer for a definition of impetigo is Celfus; and his account of it does not, in any refpect, correfpond to that which the Greeks have given of the lichenes. Under the denomination of papula, Celfus has comprifed, and accurately defcribed, two varieties of lichen, the L. agrius, and L. circumfcriptus; and he has correctly ftated the real relation between the lichen and impetigo, when he fays, that "the papula agria, through neglect or improper treatment; is often changed into impetigo." (De Mêd. lib. v. cap. 28.) Neverthelefs, all the tranflators of the Greek medical writers have ufed impetigo as fynonimous with the original term lichen; and their example has been followed by many refpectable authors on the fubject of cutaneous diforders.

By more modern writers, again, the lichen has been arranged under other genera of difeafe, with which it has ftill lefs affinity than with impetigo. Thus Sauvages defcribes it under the title of herpes farinofus; and Lorry confounds both lichen and impetigo with herpes: while Plater, Hafenreffer, and others, arrange lichen under the genüs fcabies. By adopting the character of the lichen, ftated by Dr. Willan, we may avoid this extreme degree of confufion.

An eruption, thus characterized, occurs under five or fix varieties of form, to which Dr. Willan has appropriated the following titles: I. Lichen fimplex is preceded by fymptoms of feverifhnefs, or rather by a flate of irritation not amounting to fever, which is relieved after five or fix days, on the appearance of the eruption. This conlifts of diftinct red papulx, with but little infammation round their bafe, firft appearing on the face or neck, and fpreading thence over the body and limbs. In about a week, the colour of the eruption fades, and the cuticle feparates in fcurf. The duration of the complaint, however, is feldom in two cafes alike; from fourteen to twenty, or thirty days, fometimes intervene between the eruption and the renovation of the cuticle. It occurs, as well as fome other of the fpecies, annually about the beginning of fummer, or in autumn, in perfons of a very weak and irritable conftitution. 2. Lichen pilaris is merely a modification of the foregoing fpecies, the papulx appearing only at the roots of the hairs of the fini. 3. In the lichen circumfcriptus, or papulated ring-worm, the papulæ are arranged in clutters, or patches, which are of an irregular form, but with a well-defined margin, 'and appear in fuc. ceffion on the limbs or trunk of the body, fometimes by repeated eruptions, latting for fix or eight weeks. It is excited both by internal and external caufes of irritation, and is at firft attended with flight febrile fymptoms for a day or two. 4. Lichen agrius is preceded by naufea, pain in the ftomach and limbs, with fhivering and depreffion of ftrength for feveral days, which fometimes diminifh when the eruption appears. The papula are diltributed in great numbers in yarious parts of the body, face, and limbs, having a high

L I C
LI C
red colour, and being attended with itching, heat, and painful tingling. The rednefs is augmented, and a fenfation of burning and fmarting is excited by the warmth of bed, by wafhing, efpecially with foap, by violent exercife, or wine. Its duration is uncertain. Women are more liable to it than men; and it affects thofe efpecially who have undergone long continued fatigue, watching, and anxiety. In men it is often produced by the intemperate ufe of fpirituous liquors.

Cure.-Every thing heating or fimulating fhould be avoided, whether great exercife, or ftimulant food and liquors; gentle laxatives fhould be ufed; and the fkin fhould be wafhepd with warm-water, or thin gruel, by which the irritation and itching are alleviated. All ftrong applications are improper, and aggravate the complaint, producing intolerable fmarting. Mild cooling ointments, as the role-pomatum, relieve the uneafy fenfations of heat and itching.

Two other varieties of lichen are noticed by Dr. Willan, one of which he terms lichen lividus, and the other L. tropicus. The former of thefe is characterifed by papulæ of a dark or livid hue, is more permanent than the fpecies before defcribed, and principally affects perfons of weak conftitutions, who live on a poor diet, and labour hard, or refide in clofe fituations. The lichen is fometimes intermixed with petechice in the latter cafes, or larger purple patches, which point out its affinity with the purpura, or land-fcurvy. It is cured alfo by the fame means as are fuccefsful in the latter diforder; namely, by nourifhing food, moderate exercife in the open air, with the ufe of cinchona and fulphuric acid, or the tincture of muriate of iron. The lichen tropicus fignifies the eruption which is well known in hot climates by the appellation of prickly beat, of which we have already given fome account. See Heat, Prickly.

LICHENASTRUM, in Botany, fo called by Dillenius, from‘its affinity to Marchantia, his Lichen. See Jungermanita.

LICHENES, a Natural Order oir vegetables of the Cryptogamic clafs, (A/pididfere of Wiggers's Holfat. 85.) allied on one hand to the Alga, in which it was included by Linnxus, and on the other to the $F u n g i$, with many of which it nearly agrees in habit, and with fome of them very ftrikingly in the charater and fituation of its feeds. This family has rifen gradually to the confequence it now holds among botanitts, firft by the labours of Dillenius and Micheli, and next by thofe of Linneus and his pupils; but the celebrated Dr. Acharius, profeffor at Vadttena in Sweden, has finally elucidated it fully, with refpect to charaterss and fynonyms, in feveral feparate works; not merely as a genus, but as a natural order, comprifing many genera. Profeflor Hoffmann indeed, and other German betanits, had already confidered it in the fame light; but none has fo completely treated the whole fubject as this learned Swede. For a general view of the nature of this family, with the leading fections to which its fpecies have been reduced, fee Lichse. We fhall now proceed to explain what has been done towards its. generic fub-divifion, the firt attempt at which, by the fruit, was made in Wiggers's Primitic Fl. HolJatice, a work of which Weber, in a copy before us, claims being the author.
It would be tedious and difficult to trace minutely every ftep in the progrefs of thofe who have at any time adverted to the generic diftribution of Lichens. Weber's is but a rude attempt. The labours of Hoffmann, having led the way to Acharius, require fome previous explanation.
That writer, in his Flora Germanica, v. 2, publifhed in 1795, eftablifhed an order of Cryptogamia Scutellata, as ditinet from Alga, which is intended to embrace all the certain

Lichenes, though it does not, in fact, admit all that are reckoned fuch by Acharius. It is thus defined.

Scutellata. Female fructifications in orbicular, flat or convex fhields, radiated or naked, bordered or without a border, or fpirally twilted, fixed to the frond cither by their centre or their margin; and this frond is cither gelatinous, coriaceous, umbilicated, caulefcent, ftrap-like, filamentous, leafy, tartarcous, or leprous; its duration perennial, throwing out various buds or offsets. Each fhicld contains feeds within its fibrous or fpongy fubftance. - This order contains nine genera.

1. Collema. Frond pellucid, gelatinous. Shields bordered. -This comprehends the gelatinous Lichens of other authors, of which 26 fpecies are here defcribed as natives of Germany. (See Licien ; fect. 4. n. 48.) Collcma is recently admitted as a genus in Engl. Bot. v. 32. t. 2284, where the effential character is "Shields orbicular, horizontal, nearly feffile, fuperficial, with a gelatinous acceffory border." There can be no doubt of its conftituting one of the moit naturai genera to be found in any order.
2. Peltigera. Frond coriaceous. Shields (or targets) compreffed, attached by their margin.-The true coriaceous Lichens, fect. 5, as refupinatus, caninus, \&c.; nine fpecies in Germany.
3. Umbilicaria, Frond leafy, peltate. Shields contorted. -Ten fpecies. The umbilicated Lichens, fect. 6; Gyrophore of Acharius.
4. Cladonia. Frond caulefcent, cylindrical, hollow. Shields tubercular. -Thirty-feven fpecies.-This genus embraces not only thofe of the Linnæan fruticulof $i$, fect. 8 , to which rangiferinus belongs, but likewife all the fcyphyferi (or pyxidati) fect. 7. -Thirty-feven fpecies are defcribed.
5. Stereocaulon. Frond caulefcent, cylindrical, folid. Shields tubercular, globofe.-This is, perhaps, the moft exceptionable genus, confounding L. pafcbalis, (fee Liceen, fect. 8. n. III.) along with the powdery-fruited kinds, globiferus, fragilis, and compreffus; and with thefe the coralcrufted tribe, which make the Acharian genus Ifidium hereafter mentioned. Even L. niger of Hudion and Linnæus, Engl. Bot. t. II6I, perhaps more akin to Collema, though its fhields have no border, is joined with them. The whole however make but nine fpecies.
6. Ufnea. Frond ftrap-like, or filamentous. Shields radiated or naked. - Equivalent to the filamentof, fect. 9, of Linnæus. Sixteen German fpecies.
7. Lobaria. Frond lobed, laciniated, much divided, erect, or depreffed. Shields bordered,-This large and rather multifarious genus, comprehending 62 German fpecies, is divided into four fections, which perhaps run fo much into each other as to juftify the whole affemblage. 'They are

* Platifma. Frond (moftly) pitted.

To this belong many of Linnæus's fect. 4, foliacei, as the farinaceus, fraxineus, and their allies. To thefe rigidus, which is triftis, n . II2. of the Linnzan arrangement, is fub. joined. Then follow iflandicus, \&c. ; then furfuraceus, Linn. n. 53. Engl. Bot. t. 984, and ciliaris. All thefe are characterifed as having a pitted or cellular frond, which is more or lefs erect. They are however a very various tribe. -Five fpecies have a pitted depreffed frond, as faxatilis, and pulmonarius, Linn. n. 52. Engl. Bot. t. 572.-Twelve are defined as having a dilated frond, in which faccatus is included, with caperatus, perlatus, parietinus, and others, which are by no means naturally allied, nor is the character expreffive, if it means abfolutely that the frond is never pitted, or that it is more dilated than in the preceding ones.
** Phyfia. Frond inflated, as in L. ployfodes, Linn. n. 44. Engl. Bot. t. 126.
*** Squamaria. Frond narrowly divided, as in Rellaris, and its nemerous allies.
**** Placodium. Frond cruftaceous, obfcurely imbricated. In the beginning of this fection, feveral fpecies occur which are not really cruftaceous, and which are clofely akin to fellaris, though more depreffed. True exam. ples of Placodium are L. faxicola, Engl. Bot. t. 1695; as well as candicans, t. 1778; and gelidus, Linn. n. 23.
8. Pfora. Cruft figured.' Shields bordered, convex--Twenty-fix German fpecies are enumerated under this genus, many of which are among the imbricated Lichens of Linneus, others amongft his leprous or crultacenus ones. In all of them the crutt is either formed into leaflets, or pranulations of a determinate flhape, feated on a homogeneous white ckalky bafis, the outer furface being varioully coloured.
9. Verrucaria. Cruft leafefs, leprous, tartareous. Shields with or without a border--This genus comprehends molt of the leprous Lichens of Linnæus. See Lichen, fect. I and 2. Seventy-one German fpecies are defined, difpofed according to the colours of their fhields.

Such is the method of Hoffmann, who in his fumptuous and truly excellent work, entitled Planta Lichenofa, conlifting of three thin folio volumes, with feventy-t wo fine coloured plates, has defcribed and figured a great number of fipecies from all parts of the world. This book however does not exactly agree in generic diftribution with his Flora Germanica, but they are eafily compared together. The fame writer has left unfinihed an Enumeratio Lichenum, in quarto, begun in $1_{7} 84$, of which we have 102 pages, and 22 uncoloured plates, very finely drawn by the author. In this book Lichen ftands as one genus, divided into feveral fations; improperly termed orders.

Profeffor Acharius, above-mentioned, having previouly in feveral papers, with plates drawn by himfelf, in the Stockholm Tranfactions, elucidated various fpecies or tribes of Lichens, publifhed in 1798 his Lichenographic Suecice Prodromus, in one volume octavo, with coloured figures of five fpecies only. This work marks an era in cryptogamic botany. Though it profeffes to treat of Swedinh Lichens only, it in fact indicates all of which the learned writer could difcover any tidings, with their fpecific characters, fynonyms, and places of growth, befides innumerable valuable obfervations. The whole are ranged under the name of Lichen, as one genus, but divided into twenty-eight tribes, or fections, of which the genera of Hoffinann form the balis. Thefe tribes compofe three families, under whofe fubdivifions we fhall indicate them all. The peculiar terms which occur will be explained hereafter.

## Family 1. Crustaceous Licuens.

Having a cruftaceous, more or lefs expanded, bafe.
A. Crult irregular, powdery, or in fibrous flakes.
I. Lepraria. Receptacles fcarcely known.-(Moft of there come under the genus By fous in Linnæus.)
B. Cruft folid, flattifh, unitorm, nearly orbicular.
2. Verrucaria. Receptacles (thalami) hidden in the cruit, roundifh, concave, opening by a perfuration at the top.
3. Opegrapba. Clefts (lirelle) clofely attached to the cruft, and opening longitudinally.
4. Variolaria. Powdery little maffes (glomeruli) attached to the furface of the crult.
5. Urceolaria. Shields hollowed, funk in portions or warts of the furface of the crult.
6. Patellaria. Shields attached to the furface of the cruft, either concave or flat, with a border, or convex and hemifpherical, with fcarcely any.
7. Beomyces. Tubercles fmooth and even, nearly globofe, fungus-like, terminating elevated ttalks,
8. Calicium. Tubercles ftalked, lenticular, opening by a torn border, difcovering a powdery elevated difi.
C. Cruft unequal, compofed of coral-like, crowded little branches.
9. Iffidium. Tubercles terminal.
D. Crult rather leafy.
10. Pforoma. Cruft irrcgular, covered with minute fomewhat imbricated fcales. Shields lateral, as well as marginal.
11. Placodium. Cruft clofe-preffed, flat, orbicular, with a lobed permanent margin. Shields lateral.

## Family 2. Leafy Lichens.

Without a ftem, and confifting of a fimple or multiplied, feffile, divided, fomewhat membranous leaf.
E. Receptacles fcattered, feffile on the leaf.
12. Imbricaria. Shields and powdery malfes (glomeruli) lateral. Leaves membranous, depreffed, imbricated, fpreading circularly, minutely fibrous underneath.
${ }_{13}$. Collema. Shields lateral and marginal. Leaves gelatinous.
14. Endocarpon. Receptacles (thalami) hollow, immerfed in the leaf, opening by a prominent mouth. Sce Endocarpon.
15. Umbilicaria. Receptacles (trice) convoluted, raifed. See Gyrophora.
16. Lobaria. Shields and powdery maffes lateral. Leaves fomewhat coriaceous, widely fpreading, afcending, villous underneath.
17. Stiala. Shields fcattered; or Targets marginal. Leaves fomewhat coriaceous, ftamped beneath with little bald pits, amonglt down.
18. Peltidea. Targets lateral and fomewhat marginal, on the front or back of the leaf. Leaves coriacoous, moflly veiny, as well as downy, beneath.
19. Platifma. Shields target-like, fcattered. Leaves membranous, aifending, crifped, naked on both fides.
20. Pbyfcia. Shields fcattered. Leaves rather cartilaginous, fmooth, tufted, linear and jagged.
F. Receptacles elevated far above the leaves, on the tops of falks.
21. Scyphophorus. Tubercles on hollow ftalks, dilated upwards, and clofed.
22. Helopodium. Tubercles fungrous, on nearly folid, fimply fub-divided Italks, fcarcely dilated upwards.
23. Cladonia. Tubercles nearly globofe, on taper-pointed, elongated, tubular, branched and fhrubby ftalks.

## Family 3. Caulescent Lichens.

Stems either folid, branched, round and Mrubby, or elongated and thread or ftrap-like.
G. Shrubby, with folid rigid ftems.
24. Stereocaulon. Shields globofe, folid, feattered.
25. Spherophorus. Cellules terminal, finally burtting.
26. Cornicularia. Shields radiated, at length rather con-
vex, terminal.
H. Filamentous, elongated.
27. Setaria. Shields and powdery maffes lateral. Branches naked, fmooth and contiguous.
28. Ufnea. Shields flat and radiated, or convex and nightly bordered, fcattered; as well as powdery maffes. Branches with a cruftaceous, fomewhat jointed, coat.

It will eafily be feen, by comparifon, how far thefe fections anfwer to Hoffmann's genera. The firlt five have nothing correfponding with them. Patellaria is equivalent to his

## LICHENES.

Vcrrucaria, at leaft in idea. Beomyces, Seyphophorus, Helopodium, and Cladonia, are included in his Cladonia. Pforoma and Placodium are his Pfora. Collema, Peltidea, (his Peltigera,) Umbiliaria, and Ufnea, agree with his. Calicium, Iffidium, Endocarpon, Stiaa, Spharophorus, and Cornicularia, are not found in his fyitem, except that Spharophorus is, in his Pl. Licb., called Coralloides. Imbricaria, Lobaria, Platijma, and Pbyfcia are nearly comprehended under his Lobaria.
It is to be remarked that, in his generic characters, Hoffmann takes the habit into confideration. To this perhaps Acharius, as a philofophical Linnæan, had objcctions, which induced him to confider thefe different affemblages of fpecies rather as fections of one great natural genue, the fructification being fitll much in the dark. In 1803 how. ever he publifhed his $I M_{t}$ thodus, in 8 vo . with eight coloured plates, and, foon after, a fupplement. In this new work, itill keeping the Linnean principle in view, he aimed at diftinguifhing the Lichenes, as a natural order, into feveral genera; by the fructification alone. Before we detail thefe, it is neceffary to take a view of the phyfiology of the order, as explained in his able preface, as well as of his technical terms. Both thefe fubjects are treated alfo in the preface to his Prodromus; but it is beft to confider here his latter view of them only, and they are fo united together, that an explanation of the terms will fufficiently elucidate the phyfiological ideas of the author.

Thallus is ufed by Acharius for the whole plant, or herbage, of a Lichen, the frons of Linnæus (fee Frond) ; diftinct from every thing belonging to the fructification. It is root, ftem, ftalk, and leaf, all in one, its fubttance feeming to affume the nature of either, according to circumftances; but this is, in fome meafure, the cafe with every vegetable body, and by no means peculiar to a Thallus or Frond. Acharius is unvilling to ufe the latter word for a mere fhapelefs cruit or mafs of powder; but we confefs ourfelves unable to difcover any ufe, or indeed any diftinct meaning, in the new term, unlefs it were reftricted to fuch cruft or powder. Its meaning moreover, Ta入入os, a green bough, is precifely equivalent to frons; but this objection is not mate-rial.-Of the different forms and textures of this part, we have fufficiently fpoken under the article Lichen. It is an effential part, though fometimes nearly or quite deftroyed by age, though the fructification may ftill, for a while, remain.

Apothecium ( $\alpha \pi \div 9 n \times n$, a receptacle), is the receptaculum of Linnæus, the part where the feeds are formed and brought to maturity. Acharius defines it as "bearing, encompaffing, or containing the organs fubfervient to the propagation of Lichens; dittinet in figure, generally in colour and nature, from the thallus, or frond, on which it is fituated, and which fometimes furnifhes it with an exterior covering." The fecundation having taken place, in fome manner unknown to us, within the frond, thefe receptacles, (as we mulf itill beg keave to call them,) gradually increafe, and finally expofe their internal part, which is either occupied by a fibrous texture, more or lefs denfe, or is, when moilt, in fome meafure gelatinous, rarely appearing hollow. Their fhape is moft frequently roundifh, but otherwife very various, as has been already explained. (See Lichen, fect. I.) When xipe they difcharge their feeds, either naked, or contained in cafes. Sometimes, though rarely, their under-fide produces naked feeds. To the various fituations of thefe receptacles, the generic characters already explained have fufficiently alluded ; their varicus kinds have alfo been mentioned, but will now be more fully defcribed. Hedwig and Gærtner differ about the feeds of Lichens; the latter fuppofing them (for it is entirely fuppofition) to be rather of the
nature of buds or offsets, which he terms propagines, and not actual feeds produced by fexual impregnation. The reaton for this opinion feems to be, that the mode of fuch impregnation has not been difcovered, any more than in ferns or fea-weeds.

Acharius defines thirteen forts of receptacle, or apothecium.

1. Scutclla, hields. Thefe are open, orbicular, compared by Dillenius to a faucer; their border, and under-fide, of the fubltance, and ufually of the colour of the cruft, or leaf. Their difk, (ftratum proligerum of Acharius) almott always differing in colour, and totally diftinct in fubftance from the margin, contains the feeds in the vertical parallel cells of its internal fubftance. Their border is termed an accefory, not a proper, one. The flields are either thick, tumid, entirely feffile, or even funk, as in many crultaceous Lichens; or membranous, often elevated, fomewhat ftalked; very rarely they become perforated in the centre.
2. Patellule. Spangles. (See Dillenius, P. 133.) Open and orbicular, like fhields, but feffile, and by no means formed of any part of the cruft, from which they differ in colour, being moft ufually black. The feeds are lodged beneath the membrane that covers their diff, as in the former ; and the difk is furrounded by a proper border, that is, of its own fubltance and colour. Their feeds are ob. ferved to be naked in the cellular fubilance of the difk, not inclofed in cafes. The figure of the patelluld is not liable to much variation, except that the diR is fometimes concave, fometimes flat, but more frequently convex, and in an ad. vanced flate often globofe, fo that the border difappears. This kind of receptacle is properly that of the leprous tuberculated Lichens of Linnæus, and belongs to the genus Lecidea of Acharius.
3. Cypbella. Pits. Open cup-like little naked, white or yellow, fpots, on the under, generally downy, fide of the leaf, in the Acharian genus Stiza; fee Engl. Bot. t. 2298. 2359. They are at firft minute dots, globofe, and immerfed in the fubftance of the leaf; at length they burft, with an irregular margin, and difcharge a powder, which Acharius, who hás firit defined and named them, fuppofed to be of "a fpermatic nature;" by which we prefume he means of the nature of pollen.
4. Lirelle. Clefts. Open, elongated, feffile, black receptacles, with a fomewhat fpongy, very narrow, or quite linear difk, and a proper border, parallel to it on each fide. Sometimes there is an acceffory border from the cruft befides. This is the peculiar fructification of the genus Opegrapba of Perfoon ; fee Engl. Bot. vo 25 and 26 efpecially. The lirelle are either fimple and folitary, or aggregate, confluent, and branched. Thefe differences often occur in the fame fpecies. L. fcriptus of Linnæus is a fpecimen of the genus.
5. Pilidia. (miadobov, a little cap or hat.) Puffs.-Little round bordered knobs, whofe dilk, at firt covered with a membrane, and often clothed with fine grey hoarinefs, finally turns to powder. They are elongated below into a ftalk, fixed to the cruft, but totally different from it. Calicium of Perfoon has this fort of fructification.
6. Orbilla. Orbs. Flat, orbicular and dilated, of the fubftance of the frond, terminal, peltate, without a border, but often furrounded with radiating fhoots. The membrane, or dink, under which the feeds are lodged, is fmooth, moftly of the colour of the frond. Thefe are feen in the filamentous Lichens, or Ufnec. Spurious orbilla, bordered like fhields or fpangles when young, are found in fome Cornicularie of Acharius.

If orbilla produce real feeds, the filamentous Lichens have two kinds of fruit, for they bear alfo proper tubercles, or rather

## LICHENES.

rather cephalodia; fee n. 12. But we cannot eafily affent to this; fee Ufrea hereafter.
7. Pelte. Targets. Flat, clofely preffed, and attached by their whole under-fide, as if glued, to the frond, fometimes at its back. They are broad, kidney-hhaped or oblong, rarely irregular, covered with a thin coloured difk, with no border, except occafionally a very minute acceffory one, which feems to circumferibe them. In an carly flage they are concave, and concealed by a thin gelatinous fugacious membrane, or veil. (See Liches, fect. 5.) - The genus Cetraria is thought by Acharius to have fpurious pelta, with a more evident border, entire, crenate or lobed, which is unconnected with the frond beneath, though the greater part of the receptacle is clofely attached thereto, and fometimes funk into its fubftance.
8. Tricce. Buttons; (Dill.)-Roundifh, feffile, unexpanding receptacles, of a peculiar, compact, black, folid fubftance, continued along their whole furface. Their upper fide is diltinguifhed by concentric or plaited and twitted folds, covered by one common membrane through all their convolutions, and lodging in their infide naked feeds, deftitute of cafes, or cells. See Gyrophora, to which thefe buttons are peculiar.-Sometimes the prefence of but one marginal fold gives this kind of receptacle the appedrance of a patellula, fee n. 2 ; but others will ufually be found with more, on the fame plant, even in Gyrophora pufulata, Engl. Bot, t. 1283.
9. Thalamia. Hollows. - Spherical, nearly clofed receptacles, lodged in the fubftance of the frond, lined with a proper coat, under which, in their fpongy texture, are cells, each containing from two to four feeds. Each hollow finally opens by an orifice in the furface of the frond above, which fometimes fupplies it with a fpurious border. Thefe are the proper receptacles of Endocarpon; fee that article.
10. Tubercula. Tubercles.-Spherical, or flightly conical, nearly clofed, cruftaceous, black, more or lefs immerfed in the furface of the cruftaceous frond, or thallus, which they elevate; or fometimes they are expofed, being merely feffile. Each contains a ball or mafs of connected feeds, detitute of cells, but enveloped in one common membrane, and the whole are finally difcharged together by an orifice at the top of the tubercle. Such is the fruit of Verrucaria, and if this account be correct, that genus is certainly as diftinct in fructification as in habit from Endocarpon. The nature of thefe minute parts is very hard to determine, efpecially as the tubercles of Verrucaria often come under our infpection after they are emptied of their contents.

It muft be remembered that Acharius here ufes the term tubercle in a reftricted fenfe, and not with that latitude habitual to Linnæus and his followers, amongft whom it commonly, when applied to Lichens, means almoft any thing that is not a field.
ir.Cifula. Cellutes.-Globofe terminal receptacles, formed out of the fubtance of the frond, filled with uncoated feeds intermixed with fibres, and at length burtting irregularly ; as in Spharopboron. See Lichen, fect. 8.
12. Cephalodia. Knobs.-Convex, or more or lefs globular, covered externally with a coloured feed-bearing cruft, and placed generally at the extremities of ftalks originating from the frond (being rarely feffile and fcattered as in Stereocaulon), permanent. Such are feen in Bxomyces, or the Cup-bearing Lichens. (See Lichen, fect. 7.) In fome of the filamentous tribe, Ujnea, they are at firft like patellulc, and feffile, becoming afterwards convex and irregular. See orbille, n. 6.-Cephalodia are fometimes fimple, fometimes compound or conglomerated.
13. Globuli. Globules.-Globofe, folid and cruftaceous, formed of the fubftance of the frond, and terminating its points or branches, from whence they fall off entire, leaving a pit or cavity. They are fuppofed to be covered all over with a coloured feed-bearing memrobrane, and are taken for one of the modes of fructification in the I/fidium of Acharius; fee hereafter.

Acharius explains as follows certain terms ufed in his defcriptions of Lichens.

Thece arc the cafes or cells containing the feeds, in the difk of moft receptacles, at leaft in foutella.
Spore are the feeds, of whofe nature very little is known: This author declines calling them femina, becaule they ars prefumed to have no cotyledons ; but that is no fufficient reafon. The queftion is, whether they are produced by fexual impregnation; if not, they are gemma (buds or offfets). We need not here repeat what is faid under the article Gemma.

Propagula are thofe little roundifh deciduous bodies, commonly termed pozwder in fpeaking of thefe plants, but which may be called the efflorefcence. Thefe bodies are either difperfed or cluftered on the furface of the frond, and each of them is afferted by Schreber to be a hollow veficle, and by Hoffmann to difcharge, through an orifice, a, quantity of fine duft. They are alfo not unfrequently powdery at theiroutfide; fometimes interweven with very fhort and flender threads, and finally pafs into what is fuppofed by Acharius to be an affemblage of minute buds, gemma.

Acharius obferves, that "fome have taken thefe bodies for pollen, or male flowers; but that this conjecture is utterly contrary to the obfervations of Micheli and Schmidel, who faw them germinate, and produce offspring." Schmidel's remarks we have not feen, but Micheli certainly afferts, in his Nova Plantarum Genera, 74, t. 41, Q, R, that he faw this powdery matter germinate, and produce plants, in the cup-bearing tribe of Lichens. He therefore takes the fhields and their contents, which he has delineated in his t . 52, for male bloffoms, and this opinion was adopted by Linnæus. Hedwig neverthelefs, in his Theoria, p. 120, ftrongly combats this doctrine, afferting that Micheli might eafily be mittaken, as the real feeds, vifible only with a very high magnifier, would efcape obfervation, when fallen among the powder, and vegetating there, would caufe the young plants to feem the offspring of the latter. Gærtner thinks the powder is of the nature of buds; but his opinion is equally theoretical with that of Adanfon, who takes the contents of the fhields for feeds. Acharius adopts both thefe opinions, and offers an ingenious conjecture of his own, which is, that the powdery buds may be deftined to produce individual plants that propagate themfelves fubfequently by the fame mode; while the feeds of the fhields or tubercles may produce complete fructifying plants, which go on to increafe by feed. Hence, his genus of Lepraria, as he prefumes, propagates itfelf by the former means, without any other. We confefs this genus is very puzzling; but when fo conipicuous a plant as Lemna has fo long flowered and fruited without obfervation, and fuppofed Lepraria are from time to time detected with fhields, we are difpofed to attribute much to our igmorance. We certainly cannot agree with Dr. Acharius when he goes fo far as to fuggeft that the feeds, which originate from the fhields, may fometimes produce fhields alone without any frond! The latter is well known to be now and then fugacious, and fo is invariably the root of Cufcuta, though abfolutely effential to the young plant. It is very defirable that fome perfon fhould fee the germination of the feeds of Lichens, taken from the fhields; though there feems little reafon to doubt
their being fuch, whatever the powdery maffes or warts may be. We are chiefly led by the obfervation of Hoffmann, above-mentioned, to perfift in the opinion of Hedwig. If the powdery granules in queltion be really vafcular, and emit a duft, it is fo analogous to the anthers of all other known plants, and fo unlike the nature of gemma, that, if the contents of the fhields can be proved to be feeds, of which indeed we have no doubt, there would be little reafon to hefitate refpecting the others. We do not mean that every granular appearance about the fronds of Lichens mult be anthers. Much of it, doubtlefs, is gemmaceous, but anthers may accompany it; and the latter may in Lepraria impregnate minute or folitary feeds, that alfo accompany the granules, and that have hitherto efcaped detection.

Soredia are affemblages of the above powdery bodies, collected on a fort of receptacle. This Acharius exemplifies by Variolaria, as will be mentioned in fpcaking of that genus. Some foredia originate from cracks in the frond.

Pulvinulia are excrefcences found occafionally on the furface of the frond, often cluftered or branched, whofe ufe and nature are unknown. They occur in Gyrophora pufulata; but are moft remarkable in Licben glomuliferus of Lightfoot. See Engl. Bot. t. 293.

Verruce are varioufly-fhaped protuberances, folid, and ufually fmooth, originating from the cruft, and fometimes, though rarely, bearing or lodging the fructification, as int Lichen pertufus of Linnæus. See Engl. Bot. t. 677; alfo t. 2317.2336.

Podetia are ftalks elevating the fruit, as in the Cup Lichens, and are either folid or hollow.
Lorula are the long thread-like branches of the UJnea tribe.

We are now to take a compendious view of the genera of the Lichenes, as defined in the Methodus of Acharius, upon principles dependent on the parts of fructification, or, at leaft, propagation. Thefe genera are 23, difpofed in three fections.

Sect. 1. Stereothalami ; (from ${ }_{\text {sepesis }}$, to deprive, and $\left.Q_{a} \lambda x \mu 0 ;, a b e d.\right)$

Receptacle none. Organs of propagation naked, fcattered or aggregate.
I. Pulveraria. Efflorefcence powdery, collected into tufts by fine, flender, interwoven threads. (Frond none.)

This genus is now reduced by its author to the following. See Lepraria chlorina, Engl. Bot. t. 2038, a moit beautiful production, which covers rocks with a coat many inches, or fome feet, broad, refembling bright lemon-coloured cloth or velvet.
2. Lepraria. Efflorefcence fomewhat globular, fcattered loofe over a cruftaceous bafe, which it often entirely covers fuperficially. (Frond cruftaceous, indeterminate.)
This, like Pulveraria, comes under the Byfus of Linnxus, who has defcribed fome fecies of it. The molt common is L. botryoides, Ach. n. 7. Engl. Bot. t. 2148, feen every where on the trunks of trees, and on pofts, to which it gives a green colour in winter. Another very common fipecies, incana, n. 2, has been found with patellula, which make it a Lecidea of Acharius. See Engl. Bot. t. 1683; as has his leiphama, n. 3 , which is his Lecidea (or rather Parmelia) Stonei; Meth. 65 ; Lichen Hematomma; Engl. Bot. t. 486. Lepraria rubens, n. 6, is Conferva licheo nicola; Engl. Bot. t. 1609; and probably Michell's Lichen cruftaceus, arboribus adnafcens, tenuifimus, pulverulentus, ruber; Nov. Gen. 100. n. 73.

Wiggers, or rather Weber (fee the beginning of this article), places this genus (under the name Lepra, by which

Haller had previoully diftinguifhed it), in his order of A/perma, defined as "deflitute of fructification." But many of the plants, which he refers to that order, are now known to have fecds, and his genera are liable otherwife to much exception.
3. Spiloma. Efflorefcence? in thapelefs, fuperficial maffes, woolly and powdery, rigid. (Frond crultaceous, indeterminate, thin, uniform. $) \rightarrow$ Of this genus feveral fpecies may be feen in Engl. Bot. v. 29 and $30^{\circ}$. Nutwithftanding the above character, the cruft may be feen to be determinate, or limited, in Engl. Bot. t. 2150 , where it has a very diftinet and curious border.
4. Variolaria. Efflorefcence globofe, collected in diftinct allemblages (foredia). (Frond cruftaceohs, moftly deter-minate.)-Great light has been thrown upon this genus fince the publication of the Methodus of Acharius. Sce Turner Tr. of Linn. Soc. v. 9. 137-140, and Engl. Bot. v. 28.t. 2008 ; v. 29. t. 2061; fo that it is now removed by Acharius himfelf to the fecond fection of his Lichenes, as having true receptacles. It feems indece, in our opinion, to give no fmall fupport to the theory of the powdery efflorefcence (propagula), above-defcribed, being the male part of the fructification. Variolaria has true receptacles, feated on a thick tartareous cruft, which fupplies them with an acceffory border, of more or lefs thicknefs or regularity. Their difk, or fpace within the border, is occupied with an affemblage of the powdery fubftance in queftion, of which fo much has already been faid, and under which has been ooferved, in feveral feccies, a coloured flefhy or waxy difk, lodging feeds (as we all prefume them to be) in vertical cells; like a true fhield. Here then the two fexes feem united in one receptacle. In fome cafes the male is moft abundant and predominant, and the waxy dik is fcarcely difcernible; at leaft at that period of growth when fuch fpecimens have happened to come under examination, which is when the powdery fubflance renders them moft obvious; but it is moft likely, from analogy of other plants, that the difk may fubfequently increafe. In other inftances, as in Lichen multipuncrus, Engl. Bot. to 2061, the powder is in lefs proportion, fooner almolt difappears, and the diff is very evident beneath it. Some traces of a dilk may be found, in what we would term the flowering flate of the original Variolaria faginea. See Engl. Bot: t. 1713.-The Hedwigian theory of the impregnation of Lichenes appears to us greatly confirmed by thefe obfervations, and we cannot but think that the opinion of the germination of their powdery efflorefcence has been too hattily admitted by recent naturalifts.

Sect. 2. Idiothalami ; (from iboos, proper, and ia $\lambda x \mu$ oc.) Receptacle compofed of a peculiar compact hardifh fubftance, not in any manner formed out of the frond, from which it differs in colour (being moftly black).

The feeds are naked, not enclofed in proper cells, except in Endocarpon; upon which we fhall offer fame remarks hereafter.

* Receptacles open.

5. Opegrapha. Clefts black, feffile, oblong or linear, fimple, confluent, or branched, fraight or zigzag, bordered; their difk flat or flightly concave, naked or powdery, narrow, linear, rarely dilated ; their border (of therr own fubitance) often very narrow and fcarcely perceptible, fometimes tumid, elevated, and fomewhat inflexed. Sometimes there is a fpurious acceffory border, or mere fwelling of the cruft. (Frond cruflaceous, uniform, thin, generally indeterminate; occafionally leprous.)

Lichen foriptus of Limnæus, with about thirty known fpe-
cies befides, compofe this genus. See Engl. Bot. v. 25,26. 32. \&c.

5*. Arthonia. Achar. in Schrad. N. Journ. v. 1. fafc. 3. 13.3: Receptacles flattifh, (hapelefs, fmooth, without a border, feffile.

We introduce this, as defcribed by the author fince the publication of his Mishodus. A genuine example of it is A. Swarlziana, fee as above, P. 13. 1. 4. f. 1. Engl. Bot. t. 2079. We conceive feveral plants are improperly referred to this genus by Acharius, as Spilama verfico or, Engl. Bot. t. 2076, and Opegrapha aflroidea, Ach. Meth. 25. Engl. Bot. t. 1847 ; to lay nothing of Lichon croceus, t. 498, and fuccatus, t. 288 ; whofe Shields or targets have no irregularity of thape, and whofe fronds are of fo totally different nature from the cruft of $A$. Swartziana. In fhort, we can fearcely find another certain fpecies to affociate with this; except poffibly A. gyrofa, Ach. as above, p. I4. 1. 4. f. 3 .
6. Lecidea. Spangles feffile, with a flattifh or convex difk. (Frond various; cruftaceous, whether uniform and limited, or fcattered and indeterminate; or even leafy, fomewhat membranous, or ftellated. Acharius adds "rarely umbilicated;" from an idea now proved erroneous, that Gyrophora puflulata was a Lecidea). See Gyrophora.

This is an extenfive genus, excellent as far as only cruftaceous fpecies are admitted, fuch being the genuine Lichenes leprof tuberculati of Linnæus. See Lichen, fection the 1ft; and the term patellule in the prefent article... Thefe conftitute the firlt fection named catillaria, comprifing 80 fpecies, 45 of which have black or blueih receptacles, the reft red, yellow, or brownifh. - The fecond fection, lepi. doma, has a figured or lobed cruit, often imbricated, and embraces 14 fpecies, among which are Lichen niger, Engl. Bot. t. Ir6I, and decipiers, t. 870.-The third is a fmall fection, with a leafy cruft, fapberiaria, into which thould be admitted Licben dedaleus, Engl. Bot. t. 2129.-The fourth, omphalaria, contains only Gyropbora puffulata, with its near relation penfylvanica, and ought to be abolifned.
7. Calicium. Puffs (pilidia) turbinate, lenticular, or nearly globofe. They are generally elevated on a rigid fimple falk, of a totaliy different fubitance from the crult. (Frond cruftaceous, either leprous, or tartareous, uniform or fcattered, powdery and granulated, or folid and checquered, or fomewhat leafy and imbricated; fee Lichen phrocephalus, Turn. Tr. of Linn. Soc. v. 8. 260. t. 6.) Acharius defrribes is fpecies, to which feveral have tince been added by difcoveries in Lapland and England. 'They are minute productions, long confounded with fungi, from which they were firtt ditinguifhed by Perfoon on account of their cruft. It mult be acknowledged that they bear the fame analogy to feveral genera of fungi, that other Lichens, with proper ihields, do to others, the Ocafoorce of Hedwig. Examples of Calicium are feen in Engl. Bot. t. 1465, 1539, 1540. 1832. \&c.

- Recepracles clofed, at length opening.

8. Gyrophora. Buttons (trice) fuperficial, fattilh. (Frond leafy, peltate, between membranous and leathery.) See Girophora, in its proper place.
9. Bathelium. Receptacles feffile, fomewhat globofe, opening by a deciduous lid, hollow, of one to three cells, lined with feeds. (Frond cruftaceous, indeterminate, uniform.) This genus conlits of only B. maftoideum, Ach. Meth. IIr. i. S. f. 3 , found on the bark of trees at Sierra Leone by Dr. Afzelius.
10. Verrucaris. Tubercles elevated, difcharging their :oncatenated feeds by a terminal pore, or elfe falling out untire. (Frond thin cruftaceous, iniform.)

A minute tribe, of which about 40 fpecies are known. Sce Lichen Schraderi, Engl. Bot. t. 17 II; and analeptus, t. 1848 .
11. Endocarpon. Hollows (thalamia) hidden in the fubflance of the frond, each oyening by a little mouth. Seeds enclofed in cells. (Frond membranous, fomewhat cruftaceous, of a determinate figure.) See Endocampon in its proper place.

As the feeds are certainly enclofed in cells, like the genera of the next fection, it feems defirable to range this genus with them. We are moreover now well aware that it differs fufficiently from Verrucaria in having parallel cells, lodged in a difk lining the cavity of the receptacle; whereas, in that, the concatenated naked feeds, cluftered into a ball, fill the cavity. Their habits indeed are alfo totally unlike.

The receptacles of Endocarpon are, moreover, fo united to the fubltance of the frond, that they may perhaps be confidered as belonging to it, though fomewhat different in colour; fee Hedw. Crypt. v. 2. t. 20, A.

Sect. 3. Ceenothalami; (from xowos, common or geteral, and $i \alpha \lambda \alpha \mu 0:$.)

Receptacle formed of the frond itfelf, with which it agrees in fubitance and colour. Seeds inclofed in proper cells, except in Spharophoron.

## * Receptacles compound, either picrced or gaping.

12. Thelotrema. Receptacle compound; the outer one wart-like, elevated, of the fubftance of the cruft; inner fomewhat globular, with a concave difk. (Frond a firm, continued, indeterminate cruft.)-Examples are Lichen per. tufus, Linn. Mant. 131. Engl. Bot. t. 677; and L. inclufus, t. 6,8 . Acharius feems to have had the former in view when he defined the receptacles as "compound and opening by feveral little mouths." They are, in that fpecies, generally aggregate or confluent, but each is internally diftinct; and in others they are ufually as diltinet and feparate as the fhields of any other Lichen.

*     * Receptacles nearly globular, clofed, at length burfing

13. Spherophoron. Cellules nearly globofe, each enclofing a roundifh ball of naked compact feeds, which turns to black powder, and is difcharged by the torn orifice, leaving the cellule hollow and empty. (Frond firubby, branched, folid, rigid; tartareous or minutely fibrous within; with a fmooth cartilaginous coat.) -This elegant. genus is exemplified by Lichen globiferus, Engl. Bot. t. 115; and fragilis, t. 114; which, with the real fragi/is of Linnæus, make up the lift of known fpecies; fee Lichen, fect. 8 fruticulofi.
14. Ifidium. Receptacle of the feeds terminal, fomewhat difcoid, folid, various in thicknefs, covered with, and fhining through, the crust of the papille of thes frond, which at length burts, and each receptacle appears coloured, and partly expoled. Globules alfo either terminate each of the papilld, or are nearly feffile on the cruft itfelf. Thefe are coloured, and finally fall out, each leaving a little pit at the fummit of the papilla or branch. The globule is internally folid, and both fides are covered with a feed-bearing coat. (Frond cruftaceous, leprous and tartareous, cracked, rather indeterminate, either papillary only, or throwing up folid branches.)

Such is, as precifely as we can give it, the character of Iffidium, a genus founded by Acharius. He allows in a note that this genus is doubtful and ambiguous, nearett to Spbarophoron, but differing in having a properly cruftaceous frond, or bafis, and efpecially in the nature of its ftratum proligerum, (dik, or receptacle of the feeds,) which does not turn to duft; as well as in the prefence of terminal globules (fee the explanation of this term, n. 13, among the kinds of receptacles, ) even when the other receptacles are wanting.
wanting. He adds that ehis double fort of fruit in Ifidirm demands further enquiry, for he is firmly perfuaded that thefe globules belong to the organs of fructitication.-We prefume that Lichen oculatus, Engl. But. t. 1833, (fee Stereoonulon hereafter) exhibits the former kind of rectptacle, and L. Weffringii, t. 2204, the latter; but of this we have no certain knowledge.- I/didium gonalcdes of Acharius appears by his Supplementum to be a mere variety of the cruft of L. sartareus of Linnæus.
*** Receptacles orbicular, open; their border of the colour of the frond, furrounding a varioufly-colourced difk.
15. Urceolaria. . Shields or fpangles cup-fhaped, varioufly coloured, funk into the fubflance of the crult, or of its fragments or warts. Difk concave, rarely becoming flattifh by age, but never elevated above the cruft. Proper border often fcarcely manifelt, of the colour of the dill ; the acceffory one fometimes formed of the cruft, which is elevated like a ring, furrounding the difk of each fhield; but it is generally Spurious, not united to the Shield throughout. (Frond cruftaceous, tartareous, uniform, determinate, chec. quered or cracked, rarely figured or lobate.) -Esamples of this genus are the common Lichen forupofus; Engl. Bot. t. 266 ; the rare exanthematicurs, t. 118 q. Tr. of Linn. Soc. V. I. ti. 4. f. I; and Urceolaria calcarea, Ach. Meth. 142, very common on grey marble tombftones, in expofed ccuntry churchyards, where it forms infeparable hard white patches, two or three feet broad. This latt is atellaria multipunta, Hofm. Pl. Lich. t. 63.' f. 1 - 3 ; Lichen cinereus, Engl. Bot. t. 820, but not that of Linnxus. It is erroneoufly made a Parmelia in Ach. Meth. 158.
16. Parmelia. Shields fuperficial, or elevated, thick or fomewhat membranous, flattifh, convex, or concave, csowned with a free acceffory border. (Frond various, cruftaceous, leafy, branched or laciniated, cartilaginous, membranous or gelatinous.) This valt and various genus fwallows up the greater part of the natural order; Liecidea, n. 6, being far inferior to it in number of fpecies, though greatly fuperior as a natural and confiftent genus. 204 Parmelic are defined in the Methodus, befides feveral in the Supplementum of Acharius. This author is often in doubt to which genus fome \{pecies belong, for want of knowing them in every flate of growth. The tiue Parmelic have an acceffory border of the colour and fubftance of their cruft, but no proper border formed of the fubftance of the dink. The fections of this genus are eleven, diftinguifhed by the nature of their frond, the firlt three being cruftaceous, as in Lichen tartareus (fee Lichen, feet. 2.) ; the two next are leafy, more or lefs depreffed. The fixth fection confilts of Hoffmann's Collema, (fee the early part of the prefent article,) and has been lately reftored to the rank of a genus in Engl. Bot. t. 2284, with this character. "Shields orbicular, horizontal, nearly feffile, fuperficial, with a gelatinous acceffory border." The five remaining fections are the moft mifcellaneous poffible, nearly as much fo as the original genus Lieben in Linnæus.
*** Receptacles fiattened, nearly defitute of a border; their upper fide entirely covered with a thin feed-bearing difh, of confiderable folidity at the furface.
17. Stiza. Shields on the upper fide of the frond, feffile, clofe-preffed, orbicular, membranaceous; their difk flat, rarely fomewhat convex; their border acceffory, thin, entire, free, flightly tumid, rarely fringed, of the colour of the frond. Pits amongtt the down of the under fide, fcattered, feffile, minute, coloured; their dik roundifh, powdery; border elevated, a little inflexed, entire or jagged, fometimes obliterated. (Frond leafy, membranous or in
fome meafure coriaceous, lubed or jasged, downy or fhaggy beneath.)

A beautiful and natural genus, of which the pits (cyfhelle) at the back of the freod form the moft effantial character. Acharius feems to have admitted them as a part of the fructification. If fo, they fould feom to be the male blofoms. The fpecies of thiz grenus, however, nften abound with powdery efforefcence. See Lichen limblatus, Englo Bot. T. 1104; alfo fylvaticus, t. 2205; crocatus, t. 2110 ; and curatus, 2. 2359 . Acharivs has fourteen fpecies in all, feveral of them extra-european.
18. Pelidea. Targets clofely attached to the frond. about the margin, on the upper or under fide, rarcly lateral, or towards the midcle, each entirely confifting of a fattifh, very rarely concave, coloured difk; border acceffory, vely thin and fcarcely difcernible, united with the frond, and of the fame colour. (Frond leafy, rather leathery; with downy veirs and fibres beneath, rarely naked; the circumference lobed, its barren lobes deprefied, fertile oncs elongated, afcending, naked at the back.)

One of the moft natural genera, the Pelligara of Hoffmann; moft allied to Stiaa in habit, but wanting the cypheclle, inftead of which the prominent veins or ribs underneath are remarkable.-See Lichen caninus, Engl. Bot. t. 2299; rufferens, t. 2300; and the more rare sinofus, t. 887; apbthofus, t. 1119; and colifnes, t. 1834; which laft Dr. Acharius now admits as diltinct from ruffecers, ard the fame plant with his Pollidea foutasa. He allo informs us that his $P$. chlorophylla, n. 7 , is no other than his $C e-$ traria fopincoia E. For mention of other fpecies, fee Lichen, fect. 5.- Lichen croceus, Engl. Bot. t. 498 ; and Jaccatus, t. 288, feem to us much better placed in this genus, as in Ach. Meth. 290, than in Arthonia above-mentioned.
19. Cetraria. Targets fhield-like, thickifh, fat, clofepreffed, feffile, near the margin ; their circumference loofe, rounded, deformed or wavy; difk coloured, fightly convex; border acceffory, very narrow, entire or crenate, of the colour of the frond. (Frond leafy, nembranous or fomewhat cartilaginous, rigid, fmooth and naked on both fides; fometimes cellular or pitted; lobed and jagged, oftea crifped at the edges.)

The receptacles of this genus are, as it were, of an intermediate kind between hields and targets, rather moft akin to the latter. The nature of the frond however, its fmoothnefs, polifh, and membranous, fomewhat rigid, texture, render Cetraria very dillinct, on the fcore of habit, from the laft. But eight or nire fpecies are defcribed; among which are Lichen ifandicus, Limn. n. 50. Englo Bot. t. 1330; cucullatus, Sm. Tr. of Linn. Soc. v. 1. 84 . t. 4. f. 7; gluacus, Linn. n. 67. Engl. Bot.t. 1606. See Lichex, fect. 4.

2c. Corricu!aria. Orbs faipld-like, terminal, peltate, thickifh, cartilaginous, orbicular, flat; at length rather convex, uneven, and irregular; dik generally of the colour of the frond; border fcarcely any, except in a young flate, a flight acceflory one, entite, naked, or radiated, at length reflexed. (Frond cartilaginous, rigid, fmooth, rather folid, fpongy within, of a flurubby, tufted, branched habit, the branches acute.)-This genus is about as numetous in fpecies as the laft. It is conceived by Acharius to be intermediate betwixt Parmelia and $U$ J/nea, approaching the former moft in the frond, the latter in the fruit, except that the occafionally deeper colour of the dik, and the prefence of an early border, betray more affinity to the latter.-Examples of Cornicularia are, Lithen trijfis of
$+5$
Wcber,

## LICHENES.

Weber, Linn. n. it2, defcribed in Engl. Bot. t. 720 ;and ropisilus, t .452 ; which latt is $C$. Spadicen of Acharius: allo L. bicolur, Engl. Bot. t. 1853, which has lately been thewn by the Rev. "H. Davies to be the Ufnea lane nigre itghar faxis adberens; Dill. Mufc. 66. t. 13. f.8, a longdifputed and uncertain plant; t. 13. f. 9. being L. lanatus, Engh. Bot. t, $84{ }^{6}$.
21. U/finea. Orbs fomewhat coriaccous, flattened, pel. fate, naked and finouth on both fides, mollly very much dilated; difk firlt concave, then flat, even; fubfequently rather convex and cracked, or watty, fcarcely coloured; border either none at all, or an acceffory one, which is entire or toothed in the circumference, very often radiated. Kinobs (ccephalodia) on the fame, or a different plant, Feffile, lateral, fcattered ; at firlt fhield-like, and fometimes, in a manner, bordered; finally convex and warty, coloured.
This apparently double mode of fructification in the Ufnee, or proper filamentous Lichens, fee Liches, fect. the lait, involves as great a myftery as the propagula and Feeds. Experiments a requifite to determine whether the orbilla produce feeds, as weil as the ceppalodia. Till this is proved, we cannot but feel perfuaded that the former are more probably the male blofloms; or poffibly they may be abortive or imperfect female ones. Being much the moft frequent and confpicuous of the two, and greatly refembling fhields, they have been of courfe taken for the fruit, the cephalodia having nearly efcaped obfervation, till lately ; fee Sm. Tour on the Continent, ed. 2. v. 1. 335, and Engl. Bot. t. 872-(The frond of $U$ fnea is branched, with elongated, cylindrical, thready fhonts, either nearly erect, proftrate or pendulous, befet with imall fibres, and tapering towards the extremities; their coat crultaceous, more or lefs diftinctly jointed like a necklace, and roughifh, having a central or medullary thread, which is femipellucid and elaitic.)
There can be little doubt of the natural diftinctnefs of the prefent genus, though fome Parmclie, (as L. divaricatus of Linmeus,) greatly refemble it in general afpect. The jointed frond is very curious, and'we believe effential. See examples of Ufiea in I.ichenforidus, Engl. Bot. t. 872; birtus, t. 1354; plicatus, t. 257; and articulatus, t. 258. Many fpecies referred by Holfmann and others to the fame geius, as $L$. divaricatus ; and jubatus, Engl. Bot. t. 1880; make a fection in the Parmelia of Acharius, called tricharia. - If the knobs be the true female fructification, Ufinea rather belongs to the following fection.
$* * * * *$ Receptacles convex, more" or lefs gllbofe, clothed with a Secd-baring layer, or difl, Seftle cither on the branches, papillary procefes, or peculiar falks, of the frond, terminal and permanemt.
22. Steriocaulon. Knobs fomewhat turbinate; at firft furnifhed with a proper border ; then globofe, without falks, fimple or cluftered, coloured, permanent; dilk at firft flat and fmall, but gradually occupying the whole; border of the fame unisiterrupted fublitance and colour, entire, at length obliterated. (Frond folid, almoft woody, caulefcent, erect, branched, molly clothed with fcales, rough and fibrous.)

This genus is more reftricted than the Sterectaulon of Hoffmann, yet not much more certain or definite. Its proper type is Lichen pa/chalis, Engl. Bot. t. 282. Many others are doubtful. We can fcarcely diltinguifh S.tabularc, Ach. Meth. 316. 2. 7 .f. 3 , from Lichen oculatus of Dickfon, Engl. Bot. t. 1833, Ificium? oculatum of Acharius.
23. Bacinyces. Knobs capitate, nearly globofe, with refexed, farcely bordered, edges, terminating their own pro-fer'fruit-ltalts, thimple or clultered, coloured, permanent;
difk properly none; the whole globofe furfice being covered with the thin, folid, feed-bearing coat; border none. (Frond either fomewhat crultaceous; foftifh, granulated, in determinate, rarcly figured; or confiting of a cartilaginous, leafy and lobed crutt : fruic-ftalks elongated out of the very fubftance of the frond, fimple or branched, tubular or nearly folid, eithcr dilated or tapering upwards, fometimes jarren.

A great genus, very difficult for the determination of its fpecies, of which about 50 are defcribed. Acharius divides it into fix fections; in the firlt are Lichen byfoides, Engl. Bot.t. 373, and the beautiful $L$. Bromices, t. 374 : in the fecond L. Papillaria, t. 907 : in the third L. rubiformis, t. 2112, and cafpititius, t. 1796: and in the fourth L. delicatus, $\mathrm{t}, 2052$, and microb byllus, t . 1782 . Thefe four fections comprife in all but 14 or 15 fpecies. - The fifth is by fat more confiderable, confitting of the true cup-bearing Lichers; Scyphiferi or Pyxidati of authors, which terms exprefs the cup-like dilatation of their fruit-ltalks upwards. Whe have already fpoken of this tribe; fee Licuex, fect. 7. Acharius defines 24 fpecies, with numerous varieties. They feem to have engaged much of his attention. Beautiful ipecimens of them are his Bcomyces bacillaris, (Lichen filiformis', Engl. Bot. t. 2028 ; L. cocciferas, $t .205$; bellidiflorus, t. 1894 ; and alcicornis; t . I 392.-The fixth fection, confilting of 11 fpecies, embraces the fhrubby and awl-fhaped kinds of Hoffmann's Cladonia. Such are L. uncialis, Linn. n. 1c7. Engl. Bot.t. 174; rangiferinus, n. 106. t. 173; and vermicularis, n. 10S, t. 2029.

By the above detail, this arrangement of the Lichens by their fructification will be fufficiently, intelligible to any who will bend their attention to the fubject ; and the more it is ftudied, the more honour will it be found to confer on its author. Whatever occafional laxity, or want of precifion, may be obfervable in his ufe and adaptation of terms, will be found inévitable in fo intricate a ftudy, in which he was himfelf learning, as well as teaching, at every ftep. We have unfortunately not yet been able to procure a fight of his more recent publication, entitled Lichenographia Univerfalis; but from a manufcript fcheme of the whole, and fome information giv $n$ by an intelligent friend, we learn that the great object of this work is the eftablifhment of a new diftribution of Licbseses, in which the genera are vaftly multiplied. Moft of the new ones feem formed out of the fections, or fubdivifions, of thofe of his Metbodus; fo that he has here given into the plan of taking babit into the generic character, to a great extent. How far this may be eligible, we dare not, without feeing his reafons, decide. The few plates of the book in quettion are, as we underftand, entirely fubfervient to this object, and the fynonyms, as well as every thing relating to fpecific illuftration, are but compendioufy touched. Such fubjects will teceive a full and fufficiently diffufe expofition, in a new work, the firf fheets of which we have lately been alldwed to perufe, the Lichenograpbia Britannica of Mr. Dawfon Turner, and Mr. William Borrer'. This, when completed, will exhibit a finifhed hiftory of the Britifh fpecies, the knowledge of which is nearly equivalent to an acquaintance with the characters of the whole order. Analmoft complete feries of their figures is already before the public in the Englifh Botany, to which we have fo often reFerred. No other work, in any country, contains fo many. The difcrimination of the fpecies, in this and the other tribes of Britifh plants, has all along been'a primary object of that publication: the new genera of Lithenes having been very cautiouly adopted; indeed fcarcely at all iill latelly, they having been confidered by the author as in too fluc-
fluctnating a ftate, an idea which the above account will abundantly juftify. The fame reafon, in addition to fome ineritable impediments, has hitherto kept back the fourth volume of the Flora Britannica, where the Lichens will make a principal figure.

A very interefting work, on the dyeing properties of Swedifh Lichens, is publifhed at Stockholm, in 8vo. numbers, from the pen of Dr. Weftring. Seven numbers have reached us, in which 25 . Pecies of this natural order are ilIuftrated by admirable coloured plates, with diffections, drawn by the hand of Profe ar Acharius himfelf, and accompanied by fpecimens of all the colours yielded by each fpecies, the manner of procuring which is the chief fubject of the Swedif:letter-prefs. We regret that it is not given to the public in a language more generally undertood. The variety of beautiful colours afforded by Pulveraria (or Lepraria) chlorina, t. x, are very Itriking, and amount to I4, in which blue, green, and yellow are confpicuous. Ifidium $W_{\text {Vefliringii, }}$ t. 4 , yields beautiful fhades of red, which colour, with different browns, is derived from moft of the tartarcouscrufted tribe. The leafy membranous ones feem to excel in browns, as L. faxatilis, t. 2; omplaalocles, t. 7 ; and $t n-$ caulhus, t. 19, Sm. Tr. of Linn. Soc. vo I. S3. t. 4. f. 6. The cup-bearing kind appears alfo by the common $L$. $p y \times \mathrm{s}$ :datus, t. 17, ta promife much in dyeing. When the high price of Orchall, Lichen Roccella, is conlidered, the inveltigation of different fpecies under the guidance of improved chemiftry, can hardly be thought an idle fpeculation, even by thofe who have no other motive for the fludy of nature.

We cannot conclude this article, without adverting to a fubject, the confideration of which we have been difpofed to put off as long as we could, becaufe it is painful to differ decidedly from thofe who have made any fubject their frequent and patient Itudy, and to whom, moreover, natural fcience is fo much indebted in other refpects. We allude to the fuppofed transformation, for we can call it nothing lefs, of one fpecies of this family into another. We can readily explain why Lichen niter, Engl. Bot. to M161, may feem to be turned into plumberus, t. 353 , from the feeds of the latter falling into the decayed crult of the former, and finding there a molt excellent fituation for their germiuation ; as an acorn might vegetate in a bed of rotten mofs. But the transformation of a tuft of mofs into a forelt of oaks would fcarcely be a lefs miracle than that fuggetted above, or than the change of Lichen tricolor, or corneus, into a Spharia. It is but juftice, indeed, to the excellent botanit who has afferted thefe changes, to declare, that we have no lefs extraordinary reports of the fame kind from another quarter, refpecting the progrefs from one fpecies to another ; in all which cafes, doubtlefs, the intricacies of nature have deceived a molt acute obferver. We fhould fcarcely venture to fpeak on this fubject, however clear to our reafon, from the botany of the clofet only. A flight degree of practical obfervation will ferve to convince any one, that the diffemination of many far more obvious plants than thefe, is hardly to be explained, and that the fifting fcenes of nature, in the animal as well as vegetable theatre, are almott a metamorphofis. But we affert, with the confidence of experience, that the fpecics of Lichens themfelves, although undoubtedly liable to varieties like other plants, of which we have traced fome curious inftances amongt the alpine Gyrophore in particular, are as conttant as thofe of any other plants, and even better defined than many of the molt fplendid. They differ indeed much in duration, fonewhat in feafon, and above all perhaps in luxuriance, ascording to favourable or -unfavourable circumitances; for, they are
among the mot hardy children of Flora, deftined to thrive where other3 would perifh, and to prepare the way for fuch as are lefs able to provide for themfelves. To underfland them well requires laborious refearch, and perpetual olfiervation; but the curiofity and beauty of their llructure wilt repay our toil, whilit, if we miltake not, the certamey of their characters and diftinctions will afford fatisfaction, as well as intruction to the fcientilic mind. S.

LICHENOIDES, Dill. Mufc. 124. Sce Lrchen.
LICHFIELD, or Litchemln, in Gegrapes, an ancient city fituated in the humdred of O/flow, and county of Stafford, England. According to the parliamentary returns of 1800 , it then contained $5 ; 3$ houfes, and 4712 inhblitanits, of whom 1666 were found to be engaged in variens trades and manufactures. The more ancimit name of this city was Lichentield, which, according to fonse antiquaries, figninies the "lield of dead bodies," from a mafiacte of the Chriftians, faid to have takea place here during their contefts with the Pagans in the reign of the emperor Dioclefian. Mr. Shaw, however, in his "Hitory of Staffordfiire," exprefice his decided opinion agzinif the truth of this tradition, and anth greater probability corfiders it as dersing its same from its marfhy or watery fituation; the word Leccian, fro:n which lich comes, fignifying, in Saxon, land covered with water. Lichfield is fuppofed to have arifen on the ruins of a Ruman itation called Efocetum, which lies about a mile from the prefent city. Whether this idea be correet it is not eafy to determine ; but it feems to be clear that Lichfield was totally unknown, or, more properiy fpeaking, had no exittence either in the time of the Britons, or Romans. The origit of it, according to the belt authorities, is attributed to the Saxons; and Mr. Shaw fays, it was the frit eftablifhed feat of that people in England. In the year 6rog, when St. Chad was bifhop of Lichfield, it was little more than a trifling village. Even after the Norman conqueft, it was confidered by the fynod, then held at London, 'as too mean' a place for the refidence of a bifhop, for till this time the bifhops lived in an obfcure manner; and feem to have done little towards adorning, or extending the town. However, trifling as it was, it received great honours and privileges from feveral of the Saxon kings. Borrocaphill, in the neighbourhood of this city, was in all probability one of the camps, or chief refidences, of fome Saxon princes: for, though no traces of building remain, the fituation is too fine and commanding to have efcaped the notice of that warlike peoplc. In the reign of Henry I. Lichfield was encompaffed with a ditch, and the cafle was fortified by bilhop Clinton. No part of the fo!tifications of the latter are now vifible ; but the field in which it thood is Itill denominated Calllefield, and the ditch around the city may be eafily traced by an attentive obferver. The right of coinage was granted to the billiops of this diocefe by king Stephen; but they did not enjoy this privilege for any confideratle period. Bifhop Langion, who flourified in the time of Edward I. was a great benefactor to this . city, having built, among other things, an excellent bridge over the pool which feparates the town from the clofe. In the twenty-third year of the reign of the laft-mentioned prince, (1305,) Lichfield firft fent members to parliament, which it ever after continued to do. Edward VI. conltituted it a city by charter in the year 1549. This charter gave the corporation power to appoint bailiff and other chief officers, who fhould be entitled to hold all pleas within the precincts of the city. Queen Mary, with the authority of parliament, canfirncd thefe privileges in the year 1553 , and added feveral others of importance. The city, which before that time formed a member or 452
parced

## LICHFIELD.

parcel of Stafordhhire, was then declared to be a county of itfelf for ever, from and after the enfuing fealt of St. Thomas. All actions of whatever denomination arifing within the city, were ordained to be held by the bailiffs and citizens, if they could determine them, and if not by the julticcs next coming into the city, and not on any account by any authority out of the city. Thefe great privileges were conferred in con. fequence of the faithful fervices of the citizens in the time of rebellion. Both thefe charters were ratified by queen Elizabeth, and afterwards confirmed by her fucceffor James I. who granted Itill further immunities to this eity. Charles II. confirmed all the privileges of this city, by a charter dated the 5 th of November $166+$. The govirn. ment at prefent is velted in two bailiffs, clected from the common council, one of whom is named by the bifhop, and the other by the council themfelves, a recorder, a fheriff, a fteward, and other inferior officers. The burgeffes are twenty-four in number. Lichfield fends two merabers to parliament, the right of election being in the bailiffs, magiltrates, freeholders of 4 Cs . a-year, the holdcrs of burgage tenements, and fuch freemen as are enrolled ard pay fcot and lot. The number of voters is ellimated at 620 .

This city has been the feat of a bihop's fee from a very early period. The famous Se . Ceadda was confecrated in the year 669. The great Offa, king of Mercia, of which Staffordfhire formed a part, infifted upon his kingdom being governed by an archiepifcopal power, and that the bifhop of Lichfieid fenuld be appointed to that dignity. Accordingly Adulphus, the fuceellor of Sigebert, was created archbilhop of Lichfield by fope Adrian, and the pall fent to him from Rume, about the year ${ }^{7} 86$. Lichfield, however, did not long enjoy the pre-eminence it had thus acquired, for upon the death of Oifa it was again reduced to a bifhopric, at the earneft requelt of the archbithop of Canterbury, who prefented pope Leo, the then poffelfor of the papal chair, with a large fum of money, in order to give weight to his entreaties. For a confiderable period the bilhoprics of Coventry and Lichfield were united, but at the reformation they were agai: disjoined. In the tower, built by bihop Clinton, king Richard II. is faid to have kept his fumptuous Chriltmas feltival, in the year I 397, when he con. fromed two hundred tuns of wine and two thoufand oxen. This fortrefs was likewife the place of his confinement when on his way to the Tower of Loudon as a prifoner, about two years afterwarts. Here he attempted to effect his efcape, by flipping from the window of the high tower into the garden, but being difcosered was carried back to his conlinement. Lichfield has ever been celebrated for the artach nent of its citizens to the crufe of royalty. When the civil war commerced between kjog Charts and the parianme. \& his majety having fent an order to the inhabitants of his loyal city to brint ia their arme, his order was not only willingly compled with, b:t many of the ishabitants volurtarily flubferbed condeleable fums of meney for his ufe, and eneolled themfetve: as foldiers under the command of captain Richard Dyott, fir the protection of their own city againlt the parlamentary for es. This officer being joined by many ncblemen and gentlemen of the country under the earl of Chellerficte, the cathedral and clofe were fixad upon as a proper place of d dence from the heirht of its lituation, and the trength of the fortifications around it. In a flort time after the garrifon was a:tacked by the republican troops. During this fioge they maintained their polt with great refolution, but the town as well as the cathedral fffered very material damage. In one affiult, lord Brock, a moft furious fanatic, who commanded the parliamentary army, lolt his life in a manner fomewhat
fingular. Ifaving drawn up his army about half a mile froin Lichfield, and prayed molt devoutly for the deftruction of the cathedral, he ordered an immediate attack, and placed himfelf in a fmall houfe near the fouth gate, with the view of directing the operations of the gunners, whom he had flationed againf this gate, in order, if poffible, to open a breach. Upon fome fudden accident which occafioned the foldiers to give a fhout, lord Brook came to the door, and being perceired by a gentleman of the name of Dyott, who flood on the top of the tower, he levelled his piece at him, when the bio penetrated directly into the focket of the cye and lodged in the brain, cauting inftant death. As this happened on the feftival of St . Chad, the patron of the church, the ball was fuppofed to have been guided by the influence of that faint. The lofs of their commander, however, did not difmay the belieging army, who continued to carry on the fiege with great vigour, and at laft fucceeded in compelling the garrion to fubmit. The troops of the parliament left to fecure this fortrefs were in their turn attacked by prince Rupert, about the year 1643Colonel Rowfivell then commanded the garrifon, -who evinced the utmoll bravery in the defence of his poft. Thic: commanding fituations chofen by prince Rupert, however, for erecting his batteries, and the explofion of a mine, foon effected an extenfive breach, and the gayrifon was compelled to furrender. The prince conferred the governmett on colonel Hervey Bazot, who maintained it for the king till the utter dellruction of his majelty's affairs, when he very properly furrendered upon honourable terms.
Lichfield fands in a very pleafant and healthful valley, almolk in the centre of England, at the difance of 120 miles from the metropolis. It is furrounded by hills of a moderate fize, eafy of afcent, and of very agreeable appearance. It is chiefly inhabited by gentry, being of little importance in a mercantile point of view. The buildings of this city lave generally affumed the air and tafte of modern times, and the firit of improvement, fo confipicuous in the prefent age, is plainly manifetted in many alterations which have taken place within thefe few years. . This city was formerly divided into two portions, by three lakes cr pools of water, one of which is now dried up. It contains three : arifhes, but part of the lands of St. Chad's and St. Michael's lie without the boundaries of the ciry. Licbfield is adorned with a number of buildings well worthy of notice, both on account of their antiquaty and the fplendid Atyle of their architecture. Of thefe the molt confpicuous in every refpect is the cathedral, which ftands in the clufe, and is faid to have been fortificd by billop Clinton; though Dr. Shaw thinks he only repaired the forritications which had exited there from the time of the Saxons. Some are of opini:n, that the cathedral was frett founded by king Oliwy, in the year $65 \%$; but others attribute it to Peada, his for-in-law. Who was the firt hifhop is fomewhat uncertain, but St. Chad is generally allowed that hunour. The buildings of this cathedral, which was then called the Mercian church, were probably at firit only contiructed of wood. The whole of them were pulled down, in the year 1148 , by bifhop Clinton, and another of enlarged dimenfions, and more elegant defign, commenced in the place of the Saxon fructure. To this prelate the cathedral is indebted for that noble tone vault, which is at this day the admiration of archirects, and is undoubtedly one of the fineft works of its kind extant in England. The next benefactor to this cathedral was Walter de Langtons, who Jaid the foundation of the choir. He expended the fum of two thoufand pounds on a firine for the reliques of St . Chad, and obtained many privileges for the vicarg and canons, one
of which was the right of hanging upon the next gallows, without trial, divers perfons who withheld their lands from the church. This beautiful flrine continued in its full glory till the difolution, when the cathedral was defpoiled of this and many other valuable relics to fatiate the avarice of the tyrannical Henry.

During the fieges which it fufained, as already mentioned, in the time of the civil wars, this noble building fuffered much, being the firlt eathedral that fell into the hands of the parlizment. The roof was ftripped of its lead; and many of the curious flatues, monuments, and other carved works, were demolifhed with axes and hammers. The coflly and beautiful painted windows were battered to pieces. In fhort, little of this fplendid ftructure efcaped ruin, except the noble vaulted roof already mentioned. What did remain was ultimately deftroyed in 165 I , when colonel Danvers, by authority of the Rump Parliament, employed workmen in order to effect this purpofe. At this time, the remarkable bell, called "Jefus bell", was knocked to pieces by a pewterer named Nicklin. During this perfecution of the eftablifhed church, Dr. John Hacket rendered himfelf remarkable by his courage and refolution. When a ferjeant with a trooper were fent to flop the performance of the daily fervice, and, putting a pifol to his head, threatened to Shoot him inftantly if he did not defift, this noble prelate calmly, but refolutely, replied, "Soldier, I am doing my duty; do you your's:" a fentence which may juftly be reckoned among the remarkable inftances of the fublime, and which fo imprefled the minds of the foldiers, that they left him to the free exercife of the duty he thus evinced himfelf fo worthy to perform. No fooner was he nominated to the bihopric of Lichfield, than he vigorounly fet himfelf to reftore the ancient fplendour of the cathedral. By his large contributions, the benefactions of the dean and chapter, and the money arifing from his affiduity in foliciting aid from the gentlemen of his diocefe, he fucceeded in refloring this building to the admiration of the country. The whole underwent a thorough repair in the bilhopric of Dr. James Cornwallis, when it received its lat finifh by the addition of a painted window at the eaft end of the choir, the execution of which reflects the higheft honour on the artilt Mr. Eginton. This cathedral is 411 feet in length, and 153 in breadth. From the centre rifes a fpire 256 feet high, of moft elegant proportions, At the weft front are two towers, terminated by fpires, 66 feet in height. The portico can hardiy be equalled by any thing of the kind in England. The chancel is paved with alabafter and channel fone, in imitation of black aud white marble. The north door is particularly rich in fculpture. On the weftern front are a number of images, beautifully executed and arranged; the fuhjects of which are taken froin the facred writings. The ftatue of king Charles 1I. ftands between the two weftern fpires, where a figure of Adam, or of Chrilt, was alfo formerly placed, beneath which the other ttatues are sanged. Thefe figures were originally all richly gilt and painted; but the embellifhments have fuffered much injury from the action of the elements. With regard to the interior ornaments of this church, they are hy far too numerous to admir of pariicular notice in a work of this kind. Every part of it is filled with flatues and tonbs, bo:h ancient and modern. The nave, 60 fect in height, is fupported by pillars formed from a number of flender columns, with neat foliated capitals. Along the walls of the ailles are rows of arcades, with feats underneath. The upper windows in the nave are of uncommon appearance, being triangular, and including three circles in each; and over the weftern door is a very beautiful one, raifed by the duke of York ia the
reign of Charles 11., and afterwards beautifully painted by a gift of the benevolent dean Akenbrooke. Behind the choir was the chapel of St. Mary, which contained a ftone fcreen of the moit elegant and Splendid workmanfhip that can be imapined, embattled at the top, and adorned with feveral rows of niches moft exquifitely finihhed. Each of thefe formerly coutained a fmall flatue. The flone fcreen was taken down during the late alteration, and the materials employed to fix the organ upon, and form pillars for the entrance into the choir. This chapel now forms part of the body of the choir. It is neatly pewed, and contains, befides, forty-eight falls, which are richly carved, and appropriated for the ufe of the members of the church. The altar is of free ftone very neatly fculptured. The government of the cathedral is velted in a dean and four refidentiary canons. The diocefe of Lichtie!d, joined to Coventry, contains all the county of Stafford, (with the exception of Brome and Clent, ) all Derbythire, and nearly one-half of Shropfhire. The archdeaconries are thofe of Coventry, Stafford, Derby, and Salop. The bifhop's palace is fituated at the north-eat fide of the clofe. The original building is faid to bave been founded by bifhop Clinton, but it was probably of earlier date. This palace was quite deitroyed in the civil wars, when bihop Hacket, having expended $1000 \%$ on the prebenclal houfe, fixed upon it as his refidence. Whether the prefent palace is the fame, or another wholly erected by his fucceffor bihop Wood, is uncertain. It is now inkabited by different families; the bilhop's refidence having been for many years at Ecclefhall caftle.

The next building worthy of notice is the church of St. Chad, now called Stowe church, and is generally confidered as the oldelt foundation in or near the city. By fome writers it is even fuppofed to have been erected by the Romans, towards the end of the fecond century. St. Ceadda or Chadda, the faint to whom the church is dedicated, had his cell here in the year 653. The interior of this fabric has been lately repaired and beautified. It contains a number of neat monuments. The church of St. Mary's flands in the market-place, near the Guild-hall. Leland fays, "St. Maries is a right beautiful piece of work, in the very mar-ket-place." The body of the prefent building is very neat, and is adorned with a handfome altar-piece, and a few ancient monuments to the memory of the family of the Dyotts. St. Michael's church is ftationed at the fouth-eaft extremity of the city, on the fummit of Greenhill, and is remarkable for the extent of its burial-ground, which is fcarcely to be paralleled in England. It contains within its limits not lefs than fix or feven acres of excellent pafture land. This hill is remarkable for a court held here annually on Whitmonday, in a temporary ftand of wood erected for the purpofe. This court was anciently called the Court of Array, or view of men and arms. The high conftables having affembled all the inhabitants, they perambulate the whole city; and the whole concludes with a proceffion through the principal ftreets to the market-place, where the town-clerk, in the name of the bailiffs and citizens, delivers an oration or charge to the high conitables, thanking them for their attendance, and urging them to the duc execution of their office. The origin of this remarkable cultom is uncertain. On the top of the fame hill, a fmall edifice has been erected by fubfrription, with feats; from this fpot there is a very beautiful and extenfive view of the circumjacent country, and of the many interefting objects it affords. South of Greenhill is Folly-hall, which alfo commands a very fine profpect. Not far from hence is the hofpital and chapel of St. John, which was originally a monaftery. When it was firlt founded is unknown. The front of the prefent

## L I C

Building is remarkable for the number and antique form of its chiminies. According to an infcription over the door it was erected by bihop Smith, who was alfo the founder of Brazen-nofe College, Oxford. The free grammar fchool, built at the fame time with the hofpital, itands neariy oppofite to it.

This city can boaft of having been the place at which fome of the brightelt ornaments of the two lalt centuries were educated. Among others were the unrivalled Garrick and his friend Dr. Samuel Johnfon, whom Mrs. Barbauld defignates as the Hercules of literature. The latter was born in a ftuccoed houfe fituated at the corner of Marketftreet, where his father kept a bookfeller's fop. The Guilchall, the theatre, and the free Englifh fchool, are fituated in Broad-Itrect. 'The latter is an ancient brilding, erecteid and endowed by Thomas Minors about the year 1670. At the back of the Guildhall is a gaol for the confinement of debtors and felons apprehended within the boundaries of the city. To the welt of Bird-ftreet is a very pleafant feat called the Friary, having been formerly a monattery of Francifcan or Grey friars, founded about the year 1329. On the eaft fide there fill remains an antique monument in honour of a merchant named Richard. It is infcribed with a very fingular epitaph, which the limits of this article, however, will not admit of being inferted. The refidence of the late celebrated Dr. Darwin is fituated in a ffreet called Beacon-Atreet, which was nearly burnt to the groudd during the civil wars. Oppofite to the fhrabbery which furrounds Dr. Darwin's houfe is an hofpital, bult by Dr. Willey in the year 1504, for the fupport of fifteen poor women. Contiguous to this fpot there formerly ltowd a very Atately edifice, once the refidentiary houfe of the archdeacon ot Cheifter. Lichfield contains, befides thefe, many objeCts which 'deferve the attention of the inquifitive and curious. The mufeum and the botanic garden of Dr. Dar-, win are particularly interefting to all who have the flighteft tafte for the fubjeats of natural hiftory. Lichfield was long the refidence of Mifs Seivard.

The markets are held here on Tuefday and Friday; the fairs on the three firft Thurfdays after Twelfth day, Afh Wednefday, May itt, and the Friday before. St. Simon and St. Jude. By'means' of canals this city communicates with a variety of rivers, fome of which difcharge themfelves into the German ocean, and others into the Irifh fea and St. George's channel. LICINIUM, a word ufed by many chirurgical writers to exprefs a tent.

LICINIUS, in Biography, a Roman emperor, a native of Dacia, of an obicure origin, and accultomed from his infancy to the tols and hardhips of rural life, became'a Roman foldier, and rofe through all the gradations of the forvice. He was raifed to the rank of Augultus in the year $30 \%$. When the civil war broke out between Conftantine and Maxentius, the former fecured the friendithip of Licinius by promifing him in marriage his filter Conilantia, which alliance took place in 31.3 , when the two emperors had an interview at Milan, and joined in an edict in favour of the Chriftians. In the fame year Maximin invaded the tersitories of Licinius, and took Byzantium and Heraclea : his fuccels was very thort lived, for Licimus advanced to meẹt him, and by his military fkill obtained a complete victory. Maximin died foon after, and Licimins fucceeded to his authority over the provinces of the Eaft. The conqueror, who was harih, ignordat, and brutal, knew, not how to ufe his fuccefs with generofity or even with humanity: he put to death a great number of perions, and aroong dthers $V_{2}$ -

Yeria, the widorv of Galerius, who had been a great benefactor to Licinius. This lady had taken refuge at his court, but terrificd with his favage conduct, the thok flight, and with her aged mother wandered long in difguife through the provinces; but being at length difcovered, they were both beheaded, and their bodies thrown into the fea. After the difplay of thefe barbarities the two emperors did not live long in peace. A civil war broke out between them, in which the firlt battle was fought in 315 : Licinins was vanquifhed, and after another attempt or two to maintain his ground againft his rival, he was obliged to fue for peace, which he obtaimed on the condition of putting to death Valens, whom he had lately created Cæfar, and of refigning all his European provinces. In 317 he created his own fon Cefar, and peace was maintained during the eight following years.. About this period, Licinius, growing fufpicious of his Chriltian fubjects, who feemed to be attached to his rival, began to banifh them from about his perfon and palace, and to prohibit bifhops from vifiting each other, and from holding councils and aftemblics. By degrees the reftrictions that were laid upon them were exchanged for direct and cruel perfecution, which produced another civil war in 323. The rivals met near Adrianople, and after fome time Spent in fkirmilhes, a gencral engagement was brought on, in which the fuperior fkill of Conitantine, and valour of his European foldiers, gained a very decifive victory over the much more numerous but lofs warlike holt of Licinius. The vanquifhed emperor fhut himfelf up within the walls of Byzantium, while his fleet was deftroyed in the Hellefpont by Crifpus, the fon of Conitantine. Licinius efcaped to Chalcedon, and collecting a new army made one more effort to oppofe his foe, but being again defeated, he feems to have abandoned all ideas of farther refiftance. He retired to Nicomedia, rather with a view of gaining fome time for negociation than with the hope of effectual oppofition. His wife Conftantia, the fifter of Conftantine, interceded with her brother in favour of her hufband, and obtained from his policy, rather than from his compaffion, a folemn promife, confirmed by an oath, that after the refignation of the purple, Licinius hoould be permitted to pals the remainder of his days in peace and afluence. Licinius folicited and accepted the pardon of his offences, laid himfelf and the infignia of his office at the feet of the conqucror; he was raifed from the earth with infulting pity, was admitted the fame day to the imperial banquet, and foon afterwards was fent to Theflalonica, which had been chofen as the place of his conifnement. His imprifonment was foon terminated by death, but whether this was occafioned by a tumult of the foldiers, or by a decree of the fenate, is uncertain. He was accufed of forming a confpiracy, and of holding a treafonable correfpondence with the barbarians; but as he was never convitted, either by his own conduct or by legal evidence, his innocence, in this refpect, has been prefumed by many writers. The memory of Licinius was branded with infamy, his ftatues were thrown down, and by a rafh edict, all his laws, and the judicial proceedings of his reign, were at once abolifhed. By this victory of Conitantine, the Roman world was again united under the authority of one emperor. See Constantine. Gibbon.
Licinius Caius, a Roman tribune, of a plebeian family, rofe to that rank by his own afpiring temper: he was the firlt plebeian who was raifed to the dignity of mafter of horfe to the dictator. He was furnamed Stolo, or ufelefs forout, on account of the law which he caufed to be enacted during his tribunefhip. By this law no perfon was permitted to hold more than 500 acres of land, it being alleged, that when more was keld by one proprietor, he would not have
leifure to pull up the ufclers fhoots (Stolones) which grew from the roots of trees. He afterwards carried a law which permitted the plebcians to fhare the confular dignity with the patricians, and was himfelf one of the firft plebeian confuls, in the year 364 B.C.

Licintus, Trecula, a comic Latin poet, flourifhed about 200 years before the Chrilian era. His fragments have been publifhed by H. Stephens, and in the Corpus Poctarum, Maittaire. There was an orator and poet of this name, who lived at the fame time with Cicero, and who has been compared with Catullius. His orations are highly commended by Quintilian: he is fuppofed to have writen annzls quoted by Dionyfius Halicarnaflus. He died in the zoth ycar of his age.

LICIO, in Geografby, one of the fmaller Lipari iflands. N. lat. $38^{\circ} 54^{\prime}$. E. long. $15^{\circ} 20^{\prime}$.

LICK, a town of Prufia, with a callle; 8o miles S.E. of Konig berg. N. lat. $53^{\circ} 39^{\prime}$. E. long. $22^{\circ} 38^{\prime}$.

Lick, a name given to the fait-fprings in the weftern parts of the United States.

LICKING, a navigable river of America, in Kentucky, which rifes on the wellern confines of Virginia, interlocks with the head-waters of Kentucky river, runs in a northwett direction upwards of 180 miles, and by a mouth 150 yards wide through the fouth bank of Ohio river, oppofite to Fort Wa/hington. On this river are iron-works and numerous falt-fprings. Its chief branch is navigable nearly 70 miles. From Limeftone to this river the country is very rich, and covered with corn, rye-grass, and natural clover. Morfe.

Licking Greek, a river of Maryland, which runs into the Potownack, N. lat. $39^{\circ} 38^{\prime}$. W. long. $78^{\circ} 5^{\prime}$.
Licking Hole Creek, a river of Virginia, which runs into James river, N. lat. $37^{\circ} 42^{\circ}$. W. long. $78^{-} 5^{\prime}$.
LICKNENA, a town of Spain, in Arragon; I8 miles S.S.W. of Huefca.

LICKY, the name of a fmall river in the county of Waterford, Ireland, which falls into the river Blackwater, a little above Youghal.

LICNON, Axxo\%, in the Dionyfian folemnities, the myftical van of Bacchus; a thing fo effential to all the folemnities of this god, that they could not be duly celebrated without it. See Dioxisia.
LICNOPHORI, Axiopopos, in the Dionyfian folemnity, thofe who carried the licnon.

LICODIA, in Geegraphy, a town of Sicily, is the valley of Noto; 18 miles S.W. of Lentini.

LICONDA, a town of Africa, in the country of Tri-poli, fituated on the fea-coaft. N. lat. $30^{\circ} 36^{\prime \prime}$ : E. long. $18{ }^{1} 10$.

LICOSTAMO, a town of European Turkey, in Theffaly, the fee of a bihop, fuffragan of Lariffa; 16 miles E.S.E of Larifla.

LICQUES, a town of France, in the department of the ftraits of Calais; 10 miles S. of Calais.

LICTORS, among the Romans, were officers eftablifhed by Romulus, who always attended the chief magittrates when they appeared in public.

The duty of their office confifted in the three follawing particulars: I. Submotio, or clearing the way for the magititrate they attended: this they did by word of mouth; or, if there was occafion, by ufing the rods they alway's carried along with them. 2. Avinadverfio, or caufing the people to pay the ufual refpect to the magitirate, as to alight, if on horfeback, or in a chariot; to rife up, uncover, make way, and the like. 3. Praitio, or walking before the magiltrates : this they did not confufedly, or all together, nor

## L. I D

by two or three abreaft, but fingly following one another in a flraight line. They alfo preceded the triumphal car in public triumphs: and it was allo part of their office to arreft criminals, and to be public executioners in beheading, \&c. The enfigns were the fafces and fecuris.

As to the number of lictors allowed to each magiftrate, a dickator had twent y-four, a malter of the horfe fix, a conful twelve, a pretor fix ; and each Veital virgin, when the appeared abroad, had one.

LICUALA, in Botany, is the vernacular appellation of this palm among the natives of the Molucea illands. The name was adopted by Rumphius, and has been retained by all fucceeding botanits. Linnzus and Willdenow properly refer it to the fixth clafs, ranking it there amongft others of the natural order of Palme, Schreber having claffed it in his Appendix Palma. Schreb. 774. Limn-Sylt. Veg. ed. 14. 313. Willd. Sp. Pl. v. 2. 201. Mart. Mill. Diet. v. 3. Thunb. Nov. Gen. 70. Juff. 39. Gxertn. t. 139.Clafs and order, Hexandria Monogynis. Nat. Ord. Palme, Juff.

Gen. Ch. Cal. Perianth inferior, threc-cleft, permanent, outwardly hairy. Cor. of one petal, cloven almoft to the bafe into three equal, ovate, acute, concave fegments; Nectary annular, truncated, twice as fhort as the corolla. Stam. Filaments fix, inferted into the nectary, erect, very fhort; anthers oblong, in pairs. Pift. Germen fuperior, convex, three-cleft, furrowed, fmooth; ftyle fimple; ftigmas two. Peric. Drupa globofe, the fize of a large pea. Seed a hard nut.

Eff: Ch. Calyx three-cleft. Corolla three-cleft. Nec. tary annular, truncated. Drupa fingle-feeded.

1. L. Jpinofa, Linn. and Willd., is the only fpecies known; a native of the Moluccas, and figured by Rumphius in his Herb. Amboin. v. 1. 44. t. 9, under the name of L. arbor. The trunk of this palm is from three to four feet in height, and about the thicknefs of a man's arm, jointed, dividing in the upper part into five or fix footfalks, fcarcely fo thick as a finger, triangular, their lower part ferrated at the angles with thick rows of teeth or fines. Each of the ftalks bears a leaf which is fan-fhaped, and divided down to the bafe into about fourteen lateral, ribbed rays. Flower-ftalk rifing from the trunk, in the midft of the leaves, of the fame length with them, and involved from the bottom in fheaths, dividing at the top into about five fmaller ones, which bear green heads, in three rows, expanding into flowers. Fruit green for a long time, then brown or blackifh. Nut oblong, very hard, longitudinally friated.

The natives of Macaflar make ufe of the finaller leaves for tobacco pipes, after they are dried, rollcd, and properly prepared. The larger leaves are ufed for packages, but the wood is not fufficiently durable to be confidered ufeful.

LICZ, in Geography, a town of Auftrian Poland, in GaLicia; 30 miles W. of Przemyl.

LID, or Lxid, a river of England, which runs into the Tamar, 4 miles N.N.W. of Taviftock.

LIDA, a river of Sweden, which runs into the Wenner lake, at Lidkioping.

Lids, a town and caftle of Lithuania, in the palatinate of Wilna, in which is held a provincial diet; 48 miles S. of Wilna. N. lat. $53^{\circ} 5^{\prime \prime}$. E. long. $25^{\circ} 35^{\prime}$.

LIDBECKIA, in Botany, named by Bergius, in honour of Profeffor Eric Guitaf Lidbeck, of Lund, Knight of the order of Wafa, author of feveral botanical and economical treatifes in the Stockholm Tranfactions. Berg. Cap. 306. willd. Sp. Pl. Y. 3. 2163 . Juff. 183. (Lancilia; La*
marck. Illuftr. t. 7ox. Gxrtn. v. 2. 422.)-Clafs and order, Syngenfia Polygania-fuperflua. Nat. Ord. Compofite Difcoidea, Linn. Corymbifers, Juff. See Lancisia, and Cotula, fection 2.

Liddel, Duncan, in Biography, a phyfician of the fixteenth century, was a native of Aberdeen; but he was elected profefior of aftronomy in the univerfity of Helmiladt in 1587 . He afterwards taught geometry, and ultimately medicine, of which he was appointed profeflor in 1596. He was likewife made firft phyfician to the duke of Brunfwick. But he quitted thefe advantages, and returned to his native country in 1607. He left the following works: "De Facultate vegetante ejufque Functionibus," Helmftadt, 1592; "Univerfe Medicinx Compendium," ibid. 1605; 1620; "Ars medica fuccinctè et perfícuè explicata," Hamburgh, 1607, feveral times reprinted; "c De Febribus Libri tres," ibid. 1610; "Operum Iatro-Calenicorum, ex intimis Artis medicx adytis et penetralibus erutorum," a poothumous work, Leyden, 1624 . Eloy Dict. Hift.
Liddel, in Geography, a river of Scotland, which rifes in Roxburghhire, and joins the Efle, three miles fouth of Longholm, in the county of Dumfries; giving to the valley in which it flows the name of Liddeldale, or Lithdale.

LIDEN, a town of Sweden, in Angermanland; 60 miles N.N.W. of Hernofand.

LIDENS, a fown of Sweden, in the province of Medelpadia; 24 miles N.N.W. of Sundfwal.

LIDFORD, a village of England, in the county of Devon, near the forelt of Dartmoor, fituated in a parifh faid to be the larget in England, including almof the whole of Dartmoor. It was formerly a fortified town, furrounded with walls and a moat, and having three gates, of which no trace now remains. It is fuppofed to have been deftroyed by the Danes in the year 997. In this village is an ancient cafte, in which courts are held for the duchy of Cornwall; and offenders againft the ftannary laws were here confined in a dreary and difmal dungeon, which gave rife to a proverb, "Lydford laws punifh a criminal firft, and try him afterwards." This village contairs only about 15 houfes, and its fituation is bleak and dreary; 28 miles. W. of Exeter. Cruttwell.

LIDHULT, a town of Sweden, in the province of Smaland; 60 miles S. of Jonkoping. N. lat. $5^{\prime}{ }^{\prime} 5^{\prime}$. Ep long. $15^{7}$ I $4^{\prime}$.
LIDKIOPING, a fmal!, neat, trading town of Sweden, fituated in the midtt of a plain near lake Wetter or Wenner, at the influx of the Lide, and contaning the epifcopal palace, the cathedral, and the palace in which refides the governor of Ealt Gothland; $4^{2}$ miles E.N.E. of Uddevalla. N. lat. $58^{\circ} 33^{\prime}$. E. long. $12^{\circ} 54^{\prime}$.

LIDL, in Biography, a native of Germany, who arrived in England about the year 1785 , and was a remarkable fine performer on the viol da gamba. His tafte and expreffion on this ungrateful initrument were exquifite; though he had embarrafed himfelf with the additional dif: ficulties of bafe ftrings at the back of the neck of his inftrument, with which he accompanicd himfelf, thrumming them in pizzicato with his left thumb; an admirable expedient in a defert, or evea in a houfe, where there is bat one mufician ; but to be at the trouble of accompanying yourfelf in a great concert, furrounded by idle performers who could take the trouble off your hands; and leave yoni more at liberty to execute, exprefs, and embellifh the principal melody, feemed at beft a work of fupererogation. The tone of the intrument will do nothing for itfelf, and it feems with mufic as with agriculture, the more barren and ungrateful the foil, the mare art is neceffary in its cultiva-

## I. I E

tion. And the tones of the viol da gamba are radically fo crude and nafal, that nothing but the greatelt acill and refinement can make them bearable. A human voice of the fame quality would be intolerable.

This excellent mufician died of a confunption in London, at about 30 years of age, in 1788 ; as was the cafe, about the fame time, with two other admirable German profefors, and worthy men, Pfifer and Eichner. Sec their articles, and that of Lamotte, who had likewife been in England, and died young of a confumption.

LIDMEE, or Indian Antclope, Antilops Ccrvizapra, in Zoology, a fpecies of antelope, having long, round, prominently annulated, tapering, and fpirally twifted horns, which are fmooth and fharp at the points. The body is of a brown colour above, and white on the under parts. This is the common and brown antelope of Pennant; the gazella africana S. antilope of Charloton, Ray, and Grew; the carra cervicapra of the Sylt. Nat.; the capra bezoartica of Aldrov., Olear.; the tragus ftrepficeros of Fidein; the hircus gazella of Briffon ; the Lidmee Arabium of Shaw's Travels.

It inhabits Barbary and India; it is fomewhat fmaller than a fallow-deer, brown clouded with reddifh and dufly; the belly, brealt, and infide of the thighs are white: the circumference of the orbits is white; the horns are erect, about fixteen inches long, of a black colour, and almolt entirely covered wh prominent rings, the points only being frnall, and are about twelve inches diftant. The female has no horns, and after going nine months with young, brings generally twins. Pennant dittinguifhes between the Lidmee of Barbary and that found in India; though the only difference feems to confift in the greater fize of the former, the latter being rather fraller than a roe. He likewife men. tions horns frequently fent from India, which have been ufed as daggers, that feem to belong to this Species, but with all their rings polifhed off.

LIDO di Malamocco, in Geography, a fmall ifland in the Adriatic, defended by a fort; 12 miles from Venice.

Liso di Padefrina, a long illand in the Adriatic, with a fort to defend the city of Venice.

Lido di Sottomarino, a town in the ifland of Chioggia, forming as it were the fuburbs of that city.

LIDS, a fmall inand in the Baltic, near the fouth coaft of Laaland. N. lato $54^{\circ} 41^{\prime}$. E. long. $11^{\circ} 20^{\prime}$.

LIE, a town of Arabia, in Yemen; 20 miles S. of AbuArifch.

Lie, or Lye under the Sea. See Lying, \&c.
LIEBAU, in Geography, a town of Silefia, in the principality of Schweidnitz, on the river Schwartbach; 22 miles S. of Schweidnitz.

Liebsu, Liebe, or Libona, a town of Moravia, in the circle of Prerau; 13 miles N. of Prerau. N. lat. $49^{\circ} 3^{\prime \prime}$. E. long. $17^{\circ} 28^{\prime}$.

LIEBENAU, a town of Silefia, in the principality of Glogau; 8 miles W.N.W. of Glogau. N. lat. $52^{\circ} 25^{\prime}$. E long. $15^{\circ}, 6^{\circ}$--Alfo, a town of the principality of Heffe, on the Dimel; 20 miles N.W. of Caffel. N. lat. $51^{\circ} 30^{\prime \prime}$. E. long. $9^{2} 22^{\prime}$.

LIEBENGRUND, a town of Saxony, in the circle of Neuftadt; 14 miles S. of Neuftadt. N. lat. $50^{\circ} 30^{\circ}$. E. long. $1 \mathrm{I}^{\circ} \cdot \mathrm{H}^{\prime}$ 。

LIEBENTHAL, a town of the duchy of Stiria; 12 miles S.E. of Gratz.-Alfo, a town of Bohemia, in the circle of Chrudim; 13 miles E. of Hohenmaut.-Alfo, a town of Silefia, in the principality of Jauer; 30 miles W. of Jauer. N. lat. $50^{\circ} 57^{\circ}$. E. long. $15^{\circ} 37^{\prime}$-Alfo, a town Von, XX.

## LIE

of Saxony, in the margravate of Meifien; 7 miles S.W. of Stolpen.

LIEBENIVALD, a town of Branderburg, in the Midde Mark, on the Havel ; 24 milcs N. of Derrin. N. lat. $52^{\circ} 53^{\prime}$. E. long. $13^{\circ} 30^{\prime}$.

LIEBENWARDA, a town of Saxony; 22 miles N. of Meiffen. N. lat. $51^{\mathrm{P}}{ }^{2} 8^{\prime}$. E. long. $13^{\circ} 26^{\prime \prime}$.
I.IEBENZELL, or ZELL, a town of Wirtemberg, on the Nagold; having two warm baths in its vicinity; 36 miles E.N.E. of Straffurg. If. lat. $43^{\circ} 51^{\prime}$ ' E. long. 8 43'.

LIEDEROSE, a town of Lufatia; 17 miles W. of Cuben. N. lat. $5^{9}$. E. lorty. $14^{\prime} 16^{\prime}$.

LIEBETEN, a town of Hungary; 65 miles N.N.E. of Grar:.

LIEBMUHE, a town of Prufia, in the province of Oberlund, with a caltle; 66 miles S.S.W. of Fonigherg. N. lat. $53^{\circ} 42^{\prime}$. E. long. 19 ' $45^{\prime}$.

LIEBO SEE, a lake of Brandenturg, in the Ucker Mark; fituated to the S. of Dolgen See.

LIEBSTADT, a town of Saxony, in Meifen; 14 miles S.S.W. of Drefden-A.Fo, a town of Prufia, in Oberland, with a caftle; 48 miles S.S.W. of Kotikgerg. N. lat. $53^{\circ} 57^{\prime}$, E. long. $20^{\circ} 2^{\prime}$.

LIECHEN, a town of Brandenburg, in the Ucker Mark; 40 mites N. of Berlin. N. lat. $53^{3} 52^{\prime}$. E. long. 13 ² 2 .
LIECHSTAL, or Liestal, a tolerably fruitful diftriet of Switzcrland, containing a fmall, regularly built, populouc town of the fame name, confifting of three parallel ftreets, in the canton of Balle; $2 \frac{1}{\frac{1}{2}}$ leagues S.E. of the capital, on the river Ergetz, which forms a cafcade below it. In thi diftrict are the remains of a large Roman aquedu?t.

LIE'ES, $\operatorname{Fr}$, a muffical term, equivalent to tied, bound, fuftained. It likevile implies flurred, in mufic, for bowed inftruments, when two or more notes are played with one Atroke of the bow, or with one touch of the tongue on the flute or hautbois. What muficians call a Jur is a Semicircle, - T. The fame charakler is ufed over or under two or any number of notes, in vocal mufic, that are furg to one fylliable.
LIEFDE Bay, in Geography, a bay on the north coaft of Spitzhergen. N. lat. $79^{\circ} 3^{2}$. E. long. $12^{\circ} 30^{\prime}$.

LIEGE, a bifhopric and electorate of Germany, before the French revolution; bounded on the north by Brabant ; on the eaf by Limburg, Juliers, and Luxemburg; on the fouth by Luxemburg and the French department of the Ardennes; and on the weft by Brabant, Namur, and Hainaut; about 80 miles in length from north to fouth, and of an irregular breadth. The foil is fertile, yielding corn and paftures, and alfo wine that refembles the miduling wines of Burgundy and Champagne. In this diftrict are alfo confiderable forelts, and mine-works of copper, lead, iron, and coal, ftone quarries, and fome of marble. Its chief mineral waters are thofe of Spa and Chaude-fontaine. Its principal rivers are the Meuié and Sambre. This bifhopric is now united to France, and forms the departmer: of the Ourte; which fee. Its chief exports are beer, arms, nails, ferge, leather, and coal. It formerly" contained 26 towns, divided into Walloon and Flemifh.
Liege, a city of France, and capital of the department of the Ourte, and a bihop's fee. It is large, prpulous, and rich, divided into four parts, each confifling of 12.500 inhabitants, and four cantons; the It containing $16,96+\mathrm{ir}$ habitants, on a territory of $12 \frac{1}{2}$ kiliometres, in fuur communes; the 2 d canton, including $13,9 \mathrm{C} 6$ inhabitants, on a territory of 20 kiliometres, in two communes the 3 d compreherding

17,408 inhabitants, on a territory of 15 kiliometres, in two communes; and the $4^{\text {th }}$ containing $\mathbf{1 7 , 2 3 7}$ inhabitants, on a territory of 25 kiliometres, in one commune. This city is fituated on the Meufe, in a pleafant valley between hills, watered by the rivers Loofe, Ourte, and Ambleve, which difcharge themfelves into the Meufe, as it enters this cityo It is proverbially called the hell of women, the purgatory of men, and the paradife of priefts. Liege has ten grand fauxbourgs, and two finaller, 16 gates, 17 bridges, and 154 freets, and alfo two quays planted with rows of trees. Before the revolution, it had within the city and fauxbourgs, befides the cathedral, feven collegiate and $\mathfrak{j} \circ$ parifh churches, and 46 religious houfes. The cathedral of St. Lambert is a large building, erected by St. Hubert in the year 712, on the fpot where his predeceffor St. Lambert, bifhop of Maettricht, had fuffered martyrdom. On the 22 d of No. vember 1792, Dumourier, at the head of the French troops, took poffeflion of Liege; but in the following March they were driven out of Liege and Brabant. In 1794 the French troops again entered Liege, and it was annexed to the dominions of France. N. lat. $50^{\circ} 40^{\prime}$. E. long. $5^{\circ} 37^{\prime}$. Accounts are kept in this city in forins or guldens current; each florin being divided into 20 fous or ftivers, and each ftiver into 16 pfenings. The fitiver is fometimes divided into four oertjes or liards. The patacon of account is four florins, eight efcalins or fchillings, or 80 ftivers. The gold coins of Liege are the ducat of $8 \frac{1}{2}$ current florins or 17 efcalins, the florin d'or or gold gulden of 5 current florins or 10 efcalins. The filver coins are the patacon of $4 \frac{\pi}{8}$ current florins or $8 \frac{1}{4}$ efcalins, the efcalin of 10 ftivers, and the blamafe of five ftivers. The ftiver is a copper coin. Since the year 1792 there has been no coinage at Liege ; the city and its territory having been foon after united to France, and the new French monies and coins introduced here. The commercial weight of Liege is four per cent. lefs than that of Amfterdam; 21 lbs . of Liege being $=22 \mathrm{lbs}$. avoirdupois nearly. A laft of corn contains 96 fetiers, the fetier being 1827 Englifh cubic inches, fo that 20 fetiers are $=17$ Englifh bufhels. The foot is $11 \frac{t}{3}$ Englifh inches, the ell is $21 \frac{5}{7}$ Englifh inches; fo that 18 feet of Liege $=17$ Englifh feet, and 63 ells of Liege $=38$ Englifh yards. Since its union with France, Liege has adopted the new French denominations of money in the bufinefs of exchanges.' Kelly's Univ. Cambit. vol. i.

Citizen Gretry, the eminent compofer of French comic operas, a native of that city, in his Memoirs, vol. i. p. I25, gives an account of the college eftablifhed at Rome for the reception of ftudents in all the arts from the eity of Liege. There was a time, before Rome was bereaved of its models of perfection, that we fhould have devoutly wifhed for an Englifh college of arts, fimilar to that of France and Liege, where our young artifts of promifing talents, pining to vifit Italy, but unable to bear the expence, might have an afylum in which they could be received and fupported during a certain number of years, while they were purfuing their itudies. Shuch an eftablihment would reflect honour on an opulent and learned nation, always difpofed to patronize, and collect fpecimens in all the fine arts, particularly in painting, mufic, Iculpture, and architecture.

Liege, Ligius, properly fignifies a vaffal, who holds a kind of fee that binds him in a clofer obligation to his lord than other people.

The term feems to be derived from the French lier, to bind; on account of a ceremony ufed in rendering faith or homage; which was by locking the vaffal's thumb, or his hand, in ibat of the lord, to flew that he was faft bound by his oath
of fidelity. Cujas, Vigenere, and Bignon, choofe rather to derive the word from the fame fource with leudis, or leodi, loyal, faithful. But Du-Cange falls in with the opinion of thofe who derive it from litit, a kind of vaffals, fo firmly attached to their lord, on account of lands or fees held of him, that they were obliged to do him all manner of fervice, as if they were his domettics. Fie adds, this was formerly called litgium fervitium, and the perfon litge. In this fenfe, the word is ufed, Leg. Edw. cap. 29. "Judrei fub tutela regis ligea debent effe;" that is, wholly under his protection.

By liege homage, the vaffal was obliged to ferve his lord towards all, and againft all, excepting his father. In which fenfe, the word was ufed in oppofition to fimple homage ; which latt only obliged the vaffal to pay the rights and accuftomed dues to his lord; and not to bear armis againft the emperor, prince, or other fuperior lord: fo that a liege man was a perfon wholly devoted to his lord, and entirely under his command.
"Omnibus, \&cc. ' Reginaldus, rex Infularum, falutem.' Sciatis quod deveni homo ligeus domini regis Anglix Joz hannis, contra omnes mortales, quamdiu vixero; et inde ei fidelitatem et facramentum prexliti, \&c." MS. penes W. Dugdale.

But it mult be obferved, there were formerly two kinds of liege homage: the one, by which the valfal was obliged to ferve his lord againft all, without exception even of his fovereign; the other, by which he was to ferve him againft all, except fuch other lords as he had formerly owed liege homageto. See Homage.

In our old ftatutes, lieges, and liege people, are terms pe* culiarly appropriated to the king's fubjects; as being liges, ligi, or ligati, obliged to pay allegiance to him; 8 Hen. VI. ${ }^{14}$ Hen. VIII. \&c. though private perfons had their lieges too.
"Reinaldus, Dei gratia, abbas Ramefix, prexpofito et hominibus de Branceftre, et omnibus vicinis Francis et Anglis, falutem. Sciatis me dediffe terram Ulfe, in depedene (hodie depedale) huic Bofelino, et uxori ejus Alfnix-ea conditione quod effecti fint homines." Lib. Ramef. See Allegiance and Fealty.

Liege vaffalage. See Vassalage.
LIEGNITZ, or Lignitz, in Geograpby, a town of Silefia, one of the beft as well as moft ancient in the country, and capital of a priacipality of the fame name; fituated on the Katzbach. The palace, within the town, is furrounded with a moat and high wall. Here, in a very ftately ftoneedifice, the ftates of the provinces affemble. The Lutherans have two churches in this town; and the Roman Catholics are in poffefion of the collegiate church, a magnificent college, and other religious foundations. The emperor Jofeph founded here a fpacious academy for the infruction of young gentlemen of both religions in military exercifes. The trade of Lignitz in cloth and madder is confiderable; 32 miles W. of Brellaw. N. lat. $51^{\circ} 11^{\prime}$. E. long. $16^{\circ} 10^{\prime}$.

LIEN, Fr., a word ufed in the law, of two fignifications: perfonal lien, fuch as bond, covenant, or contract: and real lien, a judgment, ttatute, recognizance, which. oblige and affect the land. Term de Ley.

Lien figuifies an obligation, tie, or claim annexed to, or attaching upon any property; without fatisfying which fuch property cannot be demanded by its owner. Thus, the cofts of an attorney are a lien upon deeds and papers in hishands; a factor has a lien on goods in his hands for balance due from his principal, \&c.

LIEN.CHAN-POU, in Geogriphy, a town of Chinefe Tartary; 12-miles N.N.E. of Ning:yaen.

## LiENIS Inpatctos. See Spleen.

LIEN-TCHEOU, in Geography, a city of China, of the firt rank, in the province of Quang-tong, feated on the river Lien-kiang, which forms a very convenient harbour for Chinefe barks. The territory of this city borders on the kingdom of Tong-king, from which it is feparated by inacceffible mountains. It has under its jurifdiction one city of the fecond elafs, and two of the third. N. lat. $21^{\circ} 40^{\prime}$. E. long. $108^{\circ} 39^{\prime}$.

LIENTERY, in Medicine, fignifies that variety of diarrhœa, in which the alimentary matters pafs off by ftool, in an undigefted or almolt unchanged ftate. The term is derived from $\lambda$ eoos, fmooth, or polifhed, and zyrecov, intefine, the ancients having been of opinion, that this affection was owing to the too great fmoothnefs and lubricity of the in. ternal membrane of the inteftines, which allowed the food to flip off in an undigefted flate.

Some writers have treated of the lientery as a difeafe altogether diftinct from diarrhoca; but Dr. Cullen properly confidered it as only a variety of that complaint. The principal caufe of the lienteric diarrhœa appears to confift in a morbid flate of irritability of the fomach and bowels; whence the former organ is excited to an exceffive motion of its mufcular coat, by the ftimulus of whatever aliment is in. troduced into it, and confequently expels it into the bowels in an undigefted ftate; and the latter, being likewifemorbidly fenfible to the fame ftimulus, hurries on the undigefted matter fpeedily through the whole canal. The motions are at the fame time loofe or liquid, becaufe, on the one hand, the undigefted matter is not taken up by the lacteals, and, on the other, the irritation of this matter, thus rapidly paffing, excites the exhalent veffels, and the excretories of the mucous glands to pour out a more abundant quantity of their fluids. This affection is generally accompanied with a great weaknefs of the digeltive power, as well as a morbid irritability of the flomach.

From this view of the fubject, two indications prefent themfelves with a view to the method of cure in lientery; namely, firft, to leften the irritability of the whole alimentary canal; and fecondly, to ftrengthen the digeftive power of the ftomach. For it muft be obferved, that, although food, when converted into a proper bland chyle by the procefs of digeftion, paffes through the bowels without producing any irritating effect : yet the fame food, when it is tranfmitted into them from the ftomach in a crude and unaltered condition, operates as an extraneous and foreign matter on the irritable villous lining of the bowels, and excites them to an extraordinary peritaltic action.

The firft indication, of allaying the irritability of the fomach and inteftines, is to be fulfilled by the adminiftration of opiates, or ocher narcotic medicines, and of aftringents. Opium itfelf is the moft effectual foother of morbid irritahility that we poffefs; and in cafes, like that under confideration, its operation is improved by the union of fome aromatic fubftance; hence the form of the opiate confection, according to the formula of the London pharmacopeia, is a grateful and efficacious medicine for this purpofe. But the irritability is ftill more effectually allayed, when aftringents and abforbents are employed at the fame time with the opiates; the belt of thefe are the catechu, kino, and the reftaceous powders, or chalk. The confectio catechu of the Edinburgh pharmacopeia, which combines the opiate, aftringent, and aromatic in one fubftance, is a valuable medicine for the fulfilment of this indication. Thefe fubftances may be adminiftered in a little diftilled water of fome aromatic vegetable, as of mint, cinnamon, pimento, \&c.

Or, with a view to the fecond indication, of frengthening the digeftive power of the flomach, the fame medicines may be combined or alternated with the tonic bitter medicines; fuch as the infufion of cafcarilla, gentian, or orange-peel, or the decoction or infufion of the cinchona. At the fame time muderate exercife, efpecially on horfeback, will aid in re-eftablifhing the functions of the ftomach; and all cold and debilitating articles of diet, or fubflances of difficult folubility, fhould be ftudioufly avoided. Of the former are ice, fallads, water-creffes, cucumbers, or other raw vegetables, vegetable acids; \&c. We once witneffed a fevere inftance of lientery, which was brought on by eating a littic ice-cream, at a time when a confiderable degree of indigeltion already prevailed; it appeared at once to fink the feeble digeftive powers of the ftomach, and the food was difcharged almolt unchanged. Of the latter, or food of difficult folubility, we may mention cheefe, hard or falted meats, fatty fubltances, \&c. which require all the energy of the healthy ftomach to fubdue them into chyle. When the alimentary canal is in the irritable condition above-mentioned, it is advifable for the invalid to avoid active exercife immediately after his meals, which is liable to hurry on the food into the inteltines before the digeltion is completed, and thus to occafion a lienteric attack. We have known perfons, fubject to habitual indigeftion, or at leaft great feeblenefs of itomach, who at thofe times certainly brought on a diarrhcea of the lienteric kind, unlefs they remained quiet for fome time after every meal. See Diarrifea.

LIEOU-KIEOU, in Gcography, iflands fituated between Corea, Formofa, and Japan, which are 36 in number. The principal and largeft is called Lieouskiou, and the reft have each a particular name. The large ifland extends from N. to S. almoft 440 lys ( 200 lys naking 60 geographical miles). and 120 or 130 from E. to W.; but on the S. fide, the extent from E. to W. is not 100 lys. The S.E. part of the ifland, where the king refides, is called "Cheouli," and it is in this part (actording to Grolier, but in the S.W. part according to d'Anville and others), that "Kint-ching;" the capital city, is fituated. (See Kin-tchin.) Thefe ifles form a powerful and extenfive empire, the inhabitants of which are civilized, and ought not to be confounded with other favage nations difperfed throughout the iflands of Afia. If we believe the iflanders themfelves, the origin of their empire is loft in the remoteft antiquity. They reckon 25 fucceffive dynafties, the duration of which forms a period of more than 18,000 years; but it is needlefs to expofe the abfurdity of thefe pretenfions. It is certain, however, that the exiftence of the country called Lieou-kieou was not known in China before the year 605 of the Chrittian era. In the courfe of this year one of the emperors of the dynafly of Soui deputed fome meffengers to enquire into their fituation. Some information having been obrained concerning them, the emperor Yang-ti fent fkilful perfons, accompanied by interpreters, to fummon the prince to do homage to the emperor of China, and to pay him tribute. The king of Lieou-kieou took offence, and returned an anfwer to the demand, that he acknowledged no prince to be his fuperior. An armament was fitted out by the emperor, and a fleet, in which was embarked 10,000 men, was equipped for the expedition. This fleet arrived in fafety at the port of Napakiang, and, in fpite of the natires, the army landed on the inand. The king fell in battle, upon which the Chinefe pillaged, facked, and burnt the royal city, made more than 5000 flaves, and returned to China. In $129^{1}$ Chi-tfon, emperor of the dynalty of Yven, thought of reviving the pretenfions of his predeceffors; and fitted out a fleet to fubduc

## LIE

I. I E
thepe inands; but this flect proceeded no further than the iffes of Pong-hou, and the weltern coaft of Formofa, from whence, under various pretentions, they returned to Fokien. It was not till the year 1373, under the reign of Hong-vou, founder of the dywally of Ming, that thefe iflands voluntarily fubmitted to the Chinefe government. Thay-tou, the prince, was folemnly declared a vaffal of the empire; and when Hong-vou had received his firft tribute, confilting of valuable horfes, aromatic wood, fulphur, tin, \&c. he fent to this prince a golden feal, and confirmed the choice he had made of one of his fons for a fuccelior. The emperor afterwards fent 36 fanilies, almolt all from the province of Fo-kien, to Lieou-kieou. Thefe families were hoipitably received, and had lands affigned them near the port of Napa-kiang, and certain revennes were appointed for their ufe. Thele families firft introduced into Lieou-kieou the learned language of the Chinefe, the ufe of their charaders, and the ceremonies practifed in China in honour of Confucius. On the other hand, the fons of feveral of the grandees of the court of Thaj-tou were fent to Nan-king to tudy Chinefe in the imperial college, where they were treated with dittinction and maintained at the emperor's expence. As thefe ifles had neither iron nor porcelain, they were fupplied by Hong-vou. Comnerce, navigation, and the arts foon began to flourifh. Thefe iflanders learned to caft bells for their temples, to manufacture paper and the fine?t ftuffs, and to make porcelain, with which they had before been fupplied from Japan. The fubfequent revolution, which placed the Tartars on the imperial throne of China, produced no change in the conduct of the kings of Lieou-tcheou. The emperor Kang-hii (about A.D. 1720) paid a more marked attention to thefe ines than any of his predeceffors. He cauled a fuperb palace to be eretted in honour of Confucius, and a college, where he maintained mafters to teach the fciences and the Chinefe characters. He alfo inftituted examinations for the different degrees of the literati. He ordained that the king of Lieoukieou fhould never fend in tribute rofe-wood, cloves, or any other production which was not of the growth of the country; but that he fhould find a fixed quantity of fulphur, copper, tin, heills, and mother-of-pearl, which is very beautiful in thefe illands. He permitted, that, befides the ufual tribute, he might prefent him with horfe furniture, pittol-cafes, and other things of the fame kind, which thefe illanders are faid to manufacture with great tafte and neatnefs.

It is more than 900 years, fays Grofier, lince the bonzes of China introduced at Lieou-kicou the worhip of Fo, and the principal books belonging to their fect. This worfhip is at prefent the eftablifhed religion both of the grandees and of the people. In the royal city there is itill to be feen a magnificent temple, erected in honour of another idol borrowed from the Chinefe, named Tien-fey, which fignifies "celeftial queen, or lady." Thefe inlanders do not fwear or make promifes before their idels. For this purpofe they burn perfumes, prefent fruits, and tand refpeefully before fome flone, which they call to vitrefs the folemnity of their engagements. Of thefe flones many are to be feen in the courts of their temples, in molt public places; and upon the mountains; and they are appropriated to this ufe. They have aifo among them women confecrated fur the worthip of fpirits, who are fuppofed to have great influence over thefe beings. They vifit the fick, diltribute medicines, and write prayers for their recovery. They refpect the dead as much as the Chinefe, but their funcrals are lefs pompous. They burn the flefh of the deceafed, and preferve only the bones. They place round thero lamps, and burn perfumes, and dufferert families are ditinguihed by furnames, as in Cbina;
but a man and woman of the fame furname are not allowed to marry. The king is not at liberty to marry except in the three grand fanulics, among which the highelt offices are diftributed. A plurality of wives is allowed in thefe ines. The women are very referved; they neither ufe paint, nor wear pendants in their ears; they collect their hair on the top of their heads, in the form of a curl, and fix it in that manner by long pins made of gold or tilver. Bcfides the valt domains which the king poffeffes, he receives the produce of all the fulphur, copper, and tin-mines, and of the falt-pits, together with what arifes from the taxes; and from thefe revenues he pays the falaries of the mandarins and officers of his court. Of the mandarins there are, as in China, nine orders, diffinguifhed by the colour of their caps, or by their girdles and cuffions. In the royal city tribunals are ettablithed for managing the revenue and affairs of the principal ifland, and of all the others dependent upon it. There are alfo particular tribunals for civil and criminal matters, for the affaits of religion, for manufactures, commerce, navigation, \&cc. The veftels built in this country are highly valued by the people of China and Japan. In thefe the natives fail not only from one ifland to another, but alfo to China, Tonquin, Cochinchina, Corea, \&c. Befides thofe articles of conmerce, which their manufactories of filk, cotton, paper, arms, copper utenfils, \&ce. furnifh them, they alfo export mother-of-pearl, tortoife and other fhells, coral and whetftones, which are held in high eftimation both in China and Japan. Three languages are fpoken in the ifles of Lieoukieou, different from thofe of China and Japan. The language of the large ifland is the fame as that of the veighbouring ifles; but it differs from thofe of the ines which lie to the S.W. and N.E. Letters, accounts, and all the king's orders are written in Japanefe characters, not in the language of the country; book 8 of morality, hiftory, medicine, altronomy, and altrology, are written in Chinefe characters. The dittribution of time, and the divifion of the year, are the fame in Lieou-kieou as in China. The edifices, temples, and palace of their kings are built after the Japanefe manner ; but the houfes of the Chinefe, the hotel of the embaffador, the imperial college, and the temple of the goddefs "Tien-fey," are built after the faffion of China. The natives of Lieot-kieou are, in general, mild, affable, and temperate ; they are active and laborious, enemies to flavery, and deteff falhood and difhonelty. Excepting the grandees, bonzes, and Chinefe eftablithed in Lieou-kieou, few of the inhabitants of thefe iflands can either write or read. The people are fond of games and diverfions. They celebrate with great pomp and fplendour, thofe feltivals that are inftituted in honour of their idols, and thofe which are appointed for the termination and commencement of the year. Great harmony prevails among families and individuals, which they take care to preferve by frequent repafts, to which they invite one another. Suicide is unknown among thefe inanders; and they are free from thofe crimes that are common in the inles fituated to the N.E. of them, which being nearer to Japan, have adopted the vices of its inhabitants, as well as their manners and cuftoms. Grofier's China, vol, i. The capital is in N. lat. $26^{\circ} 2^{\prime}$. E. long. $128^{\circ} 40^{\prime}$.

Lieutaud, James, in Biography, a French mathematician, who fluurihed in the former part of the eighteenth century, was the fon of a gun-fmith at Arles, and died at Paris in the year 1733 . He particularly attached himfelf to the ftudy of aftronomy, and from the great proficiency which be made in this branch of knowledge, he obtained a feat in the French Academy of Sciences. He publihed twenty-feven valumes of the "Connoifance des Temps," from the year 1703 to 1739 .

Lieutiad, Josepii, a celebrated phyfician and anatomift, was born at Aix, in Provence, on the 2 Ift of June, I\%O3. His family had been eftablifhed from time immemorial at Aix, and had produced a great number of diftinguifhed officers, eccleliadtics, lawyers, and ufeful citizens. He was at firit intended by his parents for the church ; but the reputation of his maternal uncle, Garidel, the profeffor of medicine in his native place, gaye him a bias to the thudy of medicine. Botany was the firlt object of his purfuits. He travelled into the countries which Tournefort had furveyed before him, and brought back many plants which had efcaped the obfervation of that diftinguifhed bota nilt. This fuccefs gained him great applaufe in the univerfit ies of Aix and Montpellier, and he foon obtained in the former the reverlion of the chairs of botany and anatomy, which his uncle had long filled. Being apponted phyfician to the hofpital at Aix, the neceffity of purfuing his anatomical ftudies prefinted itfelf to his mind, together with the greater facilities which this appointment afforded, and he thenceforth nearly abandoned the fubject of bo tany. His audience foon became numerous, comprifing many perfons not engaged in the ftudy of redicine, and among others the narquis d'Argens, the intimate friend of the king. M. I ieutaud publifned, in $174^{2}$, a $f_{5}$ llabus of anatomy for the ufe of his pupils, eatitled "Eflais anatomiques, contenant 1 Hittoire exacte de toutes les Parties qui compofent le Corps humaine;" it was feveral times reprinted, with improvements, and in 1777 was edited by M. Portal, in two yolumes. He communicated alfo feveral papers on morbid anatomy, to ufe a common phrafe, and on phyfiology, to the Academy of Sciences, of which he was elected a correfponding member. In 1749, however, he quitted his poit at Aix, and went to Verfalles, at the inftance of the celebrated Senac, who then held the higheft appointment at court, and who obtained for Lieutaud the appointment of phyfician to ahe Royal Infirmary. This act of friendfinip is
faid to have originated from the private communication of fome errors, which Lieutaud had detected in a work of M Semac, and which he did not deem it proper to publifh. At Verfailles he continued his anatomical inveftigations with unabated zeal, and was foon after his arrival elected affiltan:anatomilt to the Royal Academy, to which be continued to prefent many valuable memoirs. He alfo printed a volume, entitled "Elementa Phyfiologix, \&c." Paris, 1749, which had been compofed for the ufe of his clafs at Aix. In 1755, he was nominated phylician to the royal family, and, twenty years afterwards, he obtained the place of firft phyfician to the king, Louis XVI. In 1759, he publifhed a fyitem of the practice of medicine, under the titie of "Precis de la Medicine pratique," which underwent feveral editions, with great angmentations, the beft of which is that of Paris, 1770, in two volumes, 4 to. In 1766, he publifhed a "Precis de la Matière međicale," in 8vo. afterwards reprinted in two volumes. But his molt important work, which ftill ranks high in the eltimation of phylicians. is that which treats of the feats and caufes of difeafes, afcertained by his innumerable diffections. It was entitled "Hiltoria Anatomico-medica, fittens numeroliffima cadaverum humanorum extifpicia," Paris, 1767 , in two volumes, 4to. M. Lieutaud died on the 6 th of September, 1780 , after an illnefs of five days. Eloy Dict. Hilt. Hitt. de l'Acad. Roy. des Sciences, for $1^{780}$, p. $4^{8}$.

LIEUTENANT, Locumtenens, a deputy, or officer, who holds the place of a fuperior, and difcharges in his abfence the duties of the office which he ought to exercife in perfon. The term is originally derived from legatus (which fee), and more immediately from the French lieutenant, fupplying or holding the place of another.

Of thefe, fome are civil ; as lurds lieutenants of kingdoms; who are the king's viceroys, and govern in his Itead fuch as the lord lieutenant of Ireland; and lords lieutenants of counties. See Lords Licutenants.

But the term is moft frequent among mihtary men, among whom there is a variety of lieutenants.

Lieutenant is the fecond commiffioned officer in every company of both foot and horfe, and next to the captain, who takes the command upon the death or abfence of the captain. Fuzileer corps, grenadiers, and light infantry have fecond lieutenants and no enfigns. See Captain.

Lieutenant of Artillery, is an officer of the artillery in each company, of which there are one firft and three fecond lieutenants. The firt lieutenant has the fame detail of duty with the captain, becaufe, in his abfence, be commands the company. The fecend licutenant is the fame as the enfign in an infantry regiment, being the youngelt commiffioned officer in the company, and it is his duty to affila the firlt lieutenant.

Lieutenant-General of Artillery. See Lieulenant-Ges neral of Artillery.

Lieutenant-Capain. See Captain.
Lieutenant of Engineers. See Evgneer.
Lieutenant-General. See General, Lieulenant.
In France they have alfo lieutenant-generals of their navai forces, who command immediately under the admurals.
In Holland they have a lieutenant-admiral, which is the fame with what we call a vice-admiral.

Lieutenant-General of the Ordnance, is he who has the charge of the artillery, batteries, \&c. under the maftergeneral, or in his abfence. This officer was firft eftablifhed in 1597. See Ordiance.
Lieutenait-Colonel of Foofo Sce Licutenant-Cozonzl.

## L. I E

## LIE

The dragoons have alfo a lieutenant-colonel ; but the horfe have not, properly, any; the firlt captain of the regiment fupplies the office.

Lieutenant-Colonel of Horfe, is only the firft captain of the regiment, who commands in the abfence of the colonel, taking place of all other captains.

Lievtenant of a Ship of War, is the officer next in rank and power to the captain, in whofe abfence he is charged with the command of the fhip, and alfo the execution of any orders which he may have received from the commanders relating to the king's fervice. The lieutenant, who commands the watch at fea, keeps a lift of ail the officers ard men belonging to it, in order to mufter it, and report to the captain the names of thofe who are abfent from their duty. During the night-watch he ocrafionally vifits the lower deck, or fends thither a proper officer to fee that order is obferved. He is always to be upon deck in his watch, to give orders for trimming the fails and fuperintending the navigation, and for preferving order; but he is never to change the fhip's çurfe without the captain's direction, unlefs it be to avoid an immediate danger. In time of battle he is to fee that all the men are prefent at their quarters, to order and exhort them to perform their duty, and to inform the captain of any mifbehaviour. The youngeft lieutenant of the thip, who is alfo called lieutenant at arms, is, befides his common duty, to train the feamen to the ufe of fmall arms, and in time of battle to attend aad direct them for this purpofe.

Lievtenant de Roy, the deputy governor of all ftrong towns in France before the revolution, who is a check upon the governor, and commands in his ablence.

Lieutenant Reformed, is he whofe company or troop is broke or difbanded, but continued in whole or half-pay, and ftill preferves his right of feniority and rank in the army.

LIFE, in Pby Fology, is the peculiar condition or mode of exiftence of living beings. Surrounding matter we obferve to be divided into two great claffes, living and dead: the latter is fubject to phylical laws, which the former alfo obeys in a great degree: it exhibits alfo phyfical properties, which we find equally in the latter. But living bodies are endowed moreover with a fet of properties altogether different from thefe, and contrafting with them in a very remarkable way; thefe are the vital properties, powers, faculties, or forces. They animate living matter fo long as it continues alive, and are the fource of the various phenomena which conflitute the functions of the living animal body, and which diftingnifh its hiftory from that of dead matter. The ftudy of life, then, which is the object of the fcience of phyfology, as organization is of anatomy, includes an inquiry into the properties that characterize living matter, and an inveftication of the functions which the - various organs, by virtue of thefe properties, are enabled to execute.

As the animals, which belong to the different claffes of natural hiftory, differ greatly in the number of functions, which they can exe ute, as we have every gradation from that of the greatel fimplicity, to as great a complication in fructure and functions; hife includes very different notions in the different initances. Our view would be very imperfect if we obferved it only in one example; we fhall, therefore, extend our furvey in a very general manner, through all the orders of animals. For this purpofe we fhall avall ourfelves of the very excellent introductory lecture to the Leçons d'Anatomie comparée of Cuvier, which exhibits a luminous and philofoplical view of life in general, and of its principal modifications in the different slafles of animals. We flall fubjoin a general account of

Bichat's divifion of the animal functions, and of the vital properties by which they are executed, from his Recherches fur la Vie et la Mort.

The idea of life is one of thofe general and obfcure ideas produced in us by oblerving a certain feries of phenomena poffeffing mutual relations, and fucceeding each other in a conflant order. We know not indeed the nature of the link that unites thefe phenomena, but we are fenfible that a connection muft exift; and this conviction is fufficient to induce us to give it a name, which the vulgar are apt to regard as the fign of a particular principle, though in fact that name can only indicate the totality of the phenomena which have occafioned its formation.

Thus, as the human body, and the bodies of feveral other animals refembling it, appear to refilt, during a certain time, the laws which govern inanimate bodies, and even to act on all around them in a manner entirely contrary to thofe laws, we employ the terms life and vital force to detignate what are at leaft apparent exceptions to general laws. It is therefore by determining exactly in what the exceptions confift, that we fhall fix the meaning of thofe terms. For this purpofe, let us confider living bodies in their aetive and paffive relations with the rell of nature.

For example, let us contemplate a female in the prime of youth and health. That elegant voluptuous form, that graceful flexibility of motion, that gentle warmth, thofe cheeks crimfoned with the rofes of delight, thofe brilliant eyes, darting rays of love, or fparkling with the fire of genius, that countenance, enlivened by fallies of wit, or animated by the glow of paffion, feem all united to form a molt fafcinating being. A moment is fufficient to deftroy this illufion. Motion and fenfe often ceafe without any apparent caufe. The body lofes its heat ; the mufcles become flat, and the angular prominences of the bones appear; the luitre of the eye is gone; the cheeks and lips are livid. Thefe, however, are but preludes of changes ftill more horrible. The flefh becomes fucceffively blue, green, and black: it attracts humidity, and while one portion evaporates in infectious emanations, another diffolves into a putrid fanies, which is alfo fpeedily diffipated. In a word, after a few fhort days there remains only a fmall number of earthy and faline principles. The other elements are difperfed in air, and in water, to enter again into new combinations.

It is evident that this feparation is the natural effect of the action of the air, humidity, and heat,-in a word, of external matter upon the dead body; and that it has its caufe in the elective attraction of thofe different agents for the elements of which the body is compofed. That body, however, was equally furrounded by thofe agents while living, their affinities with its molecules were the fame, and the latter would have yielded in the fame manner during life, had not their cohefion been preferved by a power fuperior to that of thofe affinities, and which never ceafed to act until the moment of death.

Of all the phenomena, the particular ideas of which enter into the general idea of life, this is what at firf fight appears to conllitute its effence, fince we can form no conception of life withour it, and fince it evidently exifts without interruption until the inflant of diffolution.

But a further itudy of any living body convinces us, that the power which preferves the union of the molecula, notwithitanding the external forces which tend to feparate them, does not confine its activity to this tranquil operation, and that the fphere of its action extends beyond the bounds of the living body itfelf. At leaft it does not appear that this power differs from that which attracts new

## LIFE.

moloculx to depofit them between thofe that already exif: and this action of the living body, in attracting the furrounding moleculx, is not lefs conflant than that which it exercifes in retaining its own; for, befides that the abforption of the alimentary matter, its converfion into nutritive fluid, and its fubfequent tranfmifion to all the parts of the body, experience no interruption, and continue from one repaft to another; another abforption conftantly takes place at the external furface, and a third by the effect of refpiration. The two latter are thofe only which exitt in all living bodies which do not digeft, that is to fay, in all plants.

Living bodies, however, do not increafe indefinitely. Nature has affigned to each limits which it cannot exceed. It follows, therefore, that they mult lofe, in one way, a great part of what they gain in another; and indeed an attentive obfervation has convinced us, that tranfipiration, and a number of other caufes, tend continually to diminih their fubltance.

This confideration muft modify the notion which we at firf formed from the principal phenomenon of life. Inftead of a conflant union in the moleculx, we cannot avoid obferving, that there is a continual circulation from the exterior to the interior, and from the interior to the exterior of bodies; a circulation which, though uniformly preferved, is notwithfanding fixed within certain limits. Thus living bodies may be confidered as a kind of receptacles, into which inert fubitances are fucceffively thrown, in order to combine among themfelves in various manners, maintain a certain place, and perform an action determined by the nature of the combinations they have formed ; and from which they efcape in order to become again fubject to the laws of inanimate nature.

It muft be obfersed, however, that there is a difference, depending on age and health, in the proportion of the parts which enter into this kind of circulation, and thofe which abandon it; and that the velocity of the motion ufually varies according to the different conditions of each living budy.

It appears, at the fame time, that life is terminated by caufes fimilar to thofe which interrupt all other known motions, and that the hardening of the fibres, and the obftruction of the veffels, render death the neceffary confequence of hife, as repofe is of motion, even though the crifis were not accelerated by innumerable caufes which are foreign to the living body.

This general and common motion of all the parts forms to peculiarly the eflence of life, that the parts which are feparated from a living body foon die, becaufe they poffefs no motion of their own, and only participate in the general motion produced by their union: Thus, according to the expreffion of Kant, the reafon of the mode of exiltence of each part of inarimate bodies belongs to itfelf, but in living Bodies it refides in the whole.

The nature of hife, as above defcribed, being once well arcertained by the obfervation of the molt conitant of its effects, a wifh would naturally arife to inveltigate its origin, and to inquire how it is communicated to the bodies it animates. Living bodies have, therefore, been traced to their infancy; and it has been endeavoured to carry this examination as near as poffible to the moment: of their formation. But they have never been obferved otherwife than completely formed, and already enjoying that vital force, 'and producing that circulatory motion, the firft caufe of which we are defirous of knowing. In fact, however feeble and minute the parts of an embryo, or of the feed of a plant, may be at the moment we are firft capable of perceiving them, they
then enjoy a real life, and poffers the germ of all the phenomena which that life may afterwards develope. Thefe obfervations, extended to all the claffes of living bodics, la lad to this general fact, that there are none of thofe bodics which have not beretofore formed parts of bodies finilar to themfelvec, from which they have beea detached. All have participated in the exiftence of other living bodies, before they exercifed the functions of life by themfelves; and it was even by means of the vital force of the bodies to which they formerly belonged, that they were enabled to develope themfelves fo completely as to become capable of enjoying Separate vitality ; for though the particular action of copulation is neceflary for the production of a number of fpecies, many aro produced without it ; copulation, therefore, is only a circumftance belonging to certain cafes, and does not change the effential natuee of gencration. It appears then that the motion proper to living bodies has really its origia in that of their parents. It is from them they have received the vital impulfe; and hence it is evident, that, in the actual flate of things, life proceeds only from life, and that there exilts no other except that which has been tranfmitted from one living body to another by an uninterruptec fucceffion.

Unable to afcend to the origin of living bodies, thereremains then within our reach no fource of information refpecting the real nature of the powers which animate them, except the examination of the compofition of thofe bodies, that is to fay, of their texture, and the union of their elements: for, though it may be truly faid, that this texture, and this union are in fome manner the refult of the action of the vital impulfe which has given them being, andwhich maintains them; it is alfo evident, that in them ouly this impulfe can have its fource and foundation: and if thefirlt union of the chemical and mechanical elements of any living body has teen effeeted by the vital force of the body from which it defcended, we ought to find in it a fimilar power, and alfo the caufes of that power, fince it has to exercife a like action in favour of the bodies which are to defcend from it.

But this compofition of living bodies is too imperfeetly known to enable us to deduce clearly from it the effects they exhibit. We obferve, in general, that they are compofed of fibres or laminx, forming altogether a feries of. reticulated fubflances more or lefs compact, which form the bafes of all their folids, as well of thofe that are mafly, as of thofe that prefent the appearance of lamine and filaments. We are acquainted with the form, the confittence . and the pofition of the larger of: thofe folids; the ramifications of the molt confiderable of their velfels, and the courfe of the fluids they contain: but their more minute branches, and their more fecret texture, cannot be traced by our inftruments. We likewife know the chemical characters of the moft apparent of the different fluids and concrete fubftances: we can even decompofe them to a certain point. This inveltigation, however, is not only imperfect, fince we cannot recompofe them, but the phenomena indicate, that there muft exilt feveral other fluids which we have not yet been able to difcover.

The efforts hitherto made by naturali.ts to prove a connection between the phenomena of living bodies and the general laws of nature, have doubtléf been unfucceffful. It would, however, be wrong, on that account, to conclude that thofe phenomena are abfolutely of a different kind; but, on the other hand, there would be much temerity in refuming this tafk, while our knowledge of the bodies in which the phenemena appear is fo limited. We thould be able to give only an empirical expofition, inftead of a rational.

## LIFE.

rational fyftem. All our labours on organic economy muft therefore be confined to its hiftory.

If, however, our knowledge of the compofition of living bodies be not fufficient for the explanation of the phenomena they exhibit, we may at leaft employ it in recognizing thofe bodies when out of a ftate of action, and in diftinguiking their remains long after death; for we find in no inert body that fibrous or cellular texture, nor that multiplicity of volatile elements which form the characters of organization and organized bodies, whether in thofe that are alive, or in thofe that have lived.

We know that inert folids are compofed only of polye. drous moleculix, which attract each other by their fides, and never move except to feparate-that they are refolvable into a very fmall number of elementary fubftances-that they are formed of the combination of thofe fubftances, and the accumulation of thofe molecules-that they grow only by the juxtapolition of new molecules, the ftrata of which envelope the preceding mafs-and that they are deftroyed only by fome mechanical agent feparating their parts, or fome chemical agent altering their combinations; but organized bodies, which are tiffues of fibres and laminæ, and have their interftices filled with fluids, refolve almoft entirely into volatile fubftances, are produced by bodies fimilar to themfelves, from which they do not feparate until they are fufficiently developed to act by thei: own force; conftantly affimilate foreign fubftances; and depofit them between their particles; grow by an internal power, and finally perifh by that in. ternal principle, or by the effect of life itfeif.

Origin by generation, growth by nutrition, termination by ceath, are the general and common characteriftics of all organized bodies: if, however, there are bodies which perform only thefe functions, and thofe which are fubfidiary to them, and poffefs only the organs neceflary for fuch operations, there is a great number of others which perform particular functions, that not only require appropriate organs, but neceffarily modify the manner in which the general functions are performed, and the organs proper to thofe functions.

Among the lefs general faculties which indicate organization, but which are not the neceflary confequences of it, the faculty of fenfation, and that of voluntary motion, in whole or in part, are the molt remarkable, and thofe which have the greatelt influence on the other functions.

We are confcious that thefe faculties exif in ourfelves, and we attribute them, by analogy, and from their apparent cxiftence, to a number of other beings, whom we therefore name animated beings, or, ufing a fingle word, animals.

It appears that thefe two faculties are neceffarily connected, the idea of fenfation is even included in that of voluntarv motion ; for we cannot conccive volition without defrre, and unaccompanied by the fentiment of pleafure or pain. There may indeed exit inanimate bodies, that manifeft external motion produced by an internal principle; but their movements are not of the fame nature as thofe which conflitute the functions effential to life, and do not merit the name of voluntary.

On the other hand, the bounty which nature difplays in all her productions, does not permit us to believe that the has deprived beings fufceptible of fenfation, that is to fay, of pleafure and pain-of the power, in a certain degree, of avoiding the one and purfuing the other. Among the miffortunes which affict our fpecies, one of the moft painful is the fituation of a man of courage withheld by a fuperior power from refilting oppreffion; and the poetic fictions beit calculated to excite compaffion, are thofe which reprefent Eentient beings inclofed within immoveable bodies. The
fighs of Clorinda iffuing, with her blood, from the trunk of a cyprefs, would arref the fury of the moft favage of mortals. La Gierufalemme Liberata, canto xiii.

But, independently of the chain which connects the two faculties, and the double fyltem of organs they require, they are accompanied by feveral modifications in thofe faculties which are common to all organized bodies: thefe modifications, joired to the two firlt mentioned faculties, are what more particularly conflitute the nature of animals.

With refpect to nutrition, for example, vegetables, which are attached to the foil, abforb immediately, by their roots, all the nutritive parts of the fluids which they imbibe. Thefe roots are fubdivided to extreme minutenefs; they penetrate into the fmalleft intertices, and proceed, if it may be fo faid, to feek at a dittance food for the plant to which they belong. Their action is tranquil and uniform, and never is interrupted except when deprived by drought of the juices which they require.

Animals, on the contrary, which are not fixed, and which frequently change their place, can tranfport with themfelves a portion of the fubitances neceftary for their nutrition: they have therefore received an internal cavity, into which they depofit the matters deftined for their aliment; and the inward furfaces of this cavity are furnifhed with innumerable abforbing pores or veffels, which, according to the energetic expreflion of Boerhaave, are real internal rocts: the magnitude of this cavity, in a number of animals, permits them to introduce folid fubftances into it. It was neceflary, then, that they fhould have inftruments for dividing thofe fubitances, and liquors for diffolving them. In. a word, with fuch animals nutrition does not immediately commence upon the abforption of the fubftances which the foil or the atmofphere furnifh them. It is neceffarily preceded by a valt number of preparatory operations, the whole of which conftitute digefion. See Digestion.

Thus, it appears, that digeftion is a function of a fecondary order, proper to animals, the exiftence of which, as well as of the alimentary canal in which it is performed, is rendered neceffary by the faculty they poffefs of voluntary mo* tion; but this is not the only confequence of that faculty.

The faculties of vegetables being very few, their organization is very fimple; almolt all their parts are compofed of fibres, which are either parallel, or diverge very little. Farther, their fixed pofition admits, that the general motion of their nutritive fluid may be preferved by fimple external agents. It appears that it proceeds upwards, by the effect of the fuction of their fpongy or capillary texture, and the evaporation which takes place at their top, and that its motion in that direction is the more rapid in proportion as the evaporation is great. It appears alfo that the motion of this fluid may even become retrograde, when it ceafes to flow in its ufual courfe, or changes into abforption by the coolners and humidity of the air.

It is not only neceffary that animals deftined continually to change their place of exiftence, and to live in all kinds of fituations and temperatures, thould poffefs within themfelves an active principle of motion for their nutritive fluid; but their more numerous and more developed faculties requiring a much greater complication of organs, their various parts being differently formed, often at a diftance from each other, and even capable of changing their refpective pofitions and directions, means more powerful, and otherwife difpofed than in vegetables, are neceffary for tranfmitting this fluid through fuch a multiplicity of intricate windings.

In the greater part of animals, therefore, this fluid is contaned in innumerable canals, which are the ramifications of two trunks communicating with each other, in fuch a man-
ner, that the one receives in its roots the fluid which the other has pulhed into its branches, and carries it back to the centre, to be again driven forward from that point.

Where the two great trunks communicate, the heart is placed: it is merely an organ, the contractions of which drive this fluid forward with great force into all the ramificentions of the arterial trunk. It has two orifices, the valves of which are fo difpofed that the fluid contained in the whole valcular fyftem can proceed in no other manner than in that we have pointed out; that is to fay, from the heart towards the other parts of the body by the arteries, and from thofe parts back to the heart by the veins. Sce Circulation and Heart.

In this movement, by rotation, confifts the circulation of the blood, which is another function of a fecondary order, proper to animals, and of which the heart is the principal agent and the regulator; but this function is not fo neceifarily connected with the faculties of fenfation and motion as the function of digeltion is; for two numerous claffes of animals are completely deprived of circulation, and are nourifhed like vegetables, by fimply imbibing a fluid which is prepared in the inteftinal canal.

In the animals that have a circulation, the blood appears to be merely a vehicle which is continually receiving from the alimentary canal, from the external furface of the body, and from the lungs, different fubilances, which are intimately incorporated with it, and continually furnifhing fubflances to all the different parts of the body, for their prefervation and growth. In its paffage through the extremities of the arteries the blood effects the real nutrition of the parts; at the fame time it changes its nature and its colour : and it is only by the acceffion of the different \{ubftances, which have juff been pointed out, that the venous blood is rendered proper for nutrition, or, in one word, becomes arterial blood.

It is by particular vefels, called lymphatics, that the venous blood receives the fubitances with which the fkin and the alimentary canal fupply it. By them, alfo, it receives even the refiduum of nutrition, and the particles which are detached from different parts, to be carríed out of the body by various excretions. See Absorbents and Absorption.

With refpect to the lungs, the air that penetrates into them produces, with the venous blood, a kind of combuftion, which appears to be neceflary to the exittence of all organized bodies: for it takes place in thom all, though in .very different ways. See Respiration.

Vegetables, and animals which have no circulation, reJpire throughout the whole of their furface, or by veffels which introduce the air at different points into the interior of their bodies. No animals refpire by a particular organ, except thofe that have a real circulation, becaufe, in them, the blood coming from one common fource, the heart, to which it conltantly returns, the veffels that contain it are fo difpofed, that it cannot arrive at the other parts until it has pafled through the l:ngs. This, however, cannot take place in vegetables, or in thofe animals in which this fluid is every where diffufed in an uniform manner, without being contained in veffels.

Hence it appears that pulmonary or branchial refpiration is a function of a third order, the exiltence of which depends on that of circulation, and that it is a remote confequence of thofe faculties that characterite animals.

Even the mode of gencration in animals, at leall as far as the fecundation of the ova is concerned, depends on their particular faculties; for the facultics they poffefs of moving and advancing towards each other, of deliring and enjoying,

Vol. XX.
has fitted them for taRing all the delighes of love: whith with refpect to the purely mechanical part, their fpermatir fluid has no occafion for any envelope, and is capable of being tranfnitted direttly to the ova; but in veqetables, which do not poffefs within tlizmfelves the power of dirceting this fluid, it was neceffary that it hoonfd be enclofed in little capfules, which are fufceptible of being tranfynted by the winds, and which form what is called the pollw of the famina. Thus, while animals, for the performarce of molt of their other functions, have, in confequance of facultics peculiar to themfelves, receised more complicated organs, they are enabled, by thofe characteriftic faculties, to exercife the function of gencration in a mamere more fimple than vegetables.

Thefe examples fhew how much influcnce the faculties of fenfation and motion, which animals pofiefs in addition to thofe of vegetables, have over the organs of all the other faculties which are common to both thefe kinds of beings. The comparifon which we thall hereafter make of the different orders of animals, will, in thie fame manner, demorItrate that the modifications of their principal functions exercife a fimilar iuflucnce or all the others:- fech is the union and harmonyo which prevails in all the parts of living bodies.

We hare thus defcribed the principal functims which compofe the animal economy. It is obrious that they may be divided into three diftinct orders. There are fome which, in conflituting animals what they are, fit them for fuifiling the part that nature has affigned to them in the general arrangement of the univerfe, - in a word, which would be fuflicient for their exiftence, if that exifence were only momentary. Thefe are the faculties of fenfation and motion: the latter enables them to execute certain actions, and the former determines their choice of the particular actions they are capable of performing. Each animal may be confidered as a partial machine, co-operating with all the other machines, the whole of which form the univerfe : the organs of motion are the wheels and levers, in fhort, all the paffive parts; but the active principle, the fpring which gives the impulfe to every part, refides only in the fenfitive faculty, without which the animal, plunged in a continual flumber, would be reduced to a flate purely vegetative;-plants themfelves, as Buffon has obferved, may be called animals which necp. Thefe two functions form the firlt order, and are termed animal fundions. But animal machines, unlike thofe we coriftruct, poffefs an internal principle of prefervation and reparation. This principle confilts in the union of the different functions which ferse to nourifh the body, that is to fay, digefion, abforption, circulation, refpiration, tran/piration, and the excretions. Thefe form the fecond order, and are denominated vital functions.

Finally, the duration of each animal's life being determined according to its kind, generation is a function of a third order, by which the individuals that perifh are replaced by others, and the exiftence of exch fpecies maintained. Sce Fuxction.

Having confidered thefe functions with refpect to theprfelves, and to their reciprocal relations, we Shall next examine the organs by which they are performed.

General idea of the organs of rubich the animal lody is compofed. - No part of the animal body is compofed entirely of folid particles; they all yield fluids by expreffion, or loie them by exficcation; and they all exhibit the appearance of an areolated or reticular texture.

The mechanical divifion of the folids conducts us, in the laft refult, to lamelle, or filaments, which feem to be the eleracatary moleculz. When the lamellix are 「eparate, and 4 U interrupted

## LIFE.

ipterrupted by fenfible vacancies, they form what is called cellululity. This cellubofity not only envelopes and pervades the molt denfe parts, but it appears to form almolt always their balis; for membrancs confirt ouly of a more compact cellulufity, the lampllx of which are more clofely approximated, and placed more exactly above each other. and are refolved inte an ordiuary cellulofity by maccration. (See Cellulab fulfarefe, and Meminane, cellulur.) The veffels are merely 'membranes romided into cylinders. All the foft parts of the body, the fibres excepted, feem to be an affemblayc of veffels, dififring from each other only according to the nature of the fluids they contain, by their number, their direction, and the ftrueture of their coats.
The chemical analy fis of thefe fublances, folids as well as fluids, exhibis only a few principles, allmolt all of which are to be found in each of them, though in very different proportions. Some earths, fome fails, phef fphorus, curbon, azoote, hydrogen, oxygen, a little fulphur, and a little iron, combined in a great variety of ways, produce different compofitions, vic. gedatine, albumen, and fibrous matter, \&ec. which, uniting in their turn, form animal folids and fluide, fuch as we know them. Dut, dillant as we are from a complete anily fis, we fee enough to convince us, not only that we alter thefe compolitions hy our experiments, but alfo that feceral of their principles entirely cicape our influtments. For a more particular account of the clementary tiffices, into which the body can be refolved, fee the artifle Fibie.
The general organ, by which we exercife the faculty of fenfation, is the mecullary fubllance, In all the animals in which we can diftinguifh it, that fubflance is divided into filaments, which arifing from certain centres, dillribute themfelves over molt parts of the body, where they appear to ferve other purpofes befides that of procuring fenfations. The centres from which thofe nervous cords proced, communicate with each other in a manner more or lefs intimate, and feveral of the filanments feem of no other ufe than to eftablifh thofe conmunications.
A nerve, when tewched by a forcign baej, caufes the fenfation of pain, thengh its contact with the parts of the body which are naturally contiguous to it, produces no fenfibie effect in a litate of health. The nerves, by which we difcern exterual objects, are proviled, at thicir extremities, with organs, each of which is difyofed in a particular: manner, and always poffertes an admirable relation to the nature of the objęts, a knowledge of which each of thefe fenfes is delined to convey to us. See Nemye and Brais.

The $\alpha$ aneral organ of motion is the flehy or mufcular fibre. This finte contriacts itfelf by volition; but the will only exercifes this power through the medium of the reeres. Every fethy fibre receives a nervons filament; and the obedience of the tibre ceafes, when the communication of that filament with the refl of the fy'tem is interrupted. Certain external agents, applied immediately to the fibre, likewife caufe contraction: and they preferse their action upon it, even after the fection of its nerve, or its total feparation from the body, durias a period which is longer or fhorter in different fpecies of animals. Thi faculty of the libre is called its irritability. Does it in the latter cafe depend upon the portion of the nerve gemuining in the Giore after i:s fection, which always forms an cflential part of it? Or is the influence of the will itfelf only a particular circumitance, and the offect of an irritating action of the nerve on a faculty inherent in the mufcular fibre? Haller and his followers have adopted the latter opinion: but
every day feems to add to the probability of the oppolite theory. See Muscle.

Be this as it may, all the internal parts of the body deftined to produce a compreffion on the fubitances they contain, have their parietes furnifhed with flefhy fibres, and receive nervous filaments; fuch is the cafe with the bladder, the intellines, the heart, \&cc. But the principal ufe of thefe fibres is the formation of mufcles. This is the name given to the bundles of flefly fibres, the extremities of which are attached to the moveable parts of the animal body. When the fibres which compofe the mufcle fhorten, the iwo pounts to which it is attached are brought towards each other: this is the fole means by which all the external motions of the body and the members, even thofe which are neceflary for removing the body entirely from one place to another, are produced.

Animals that can only crawl have their mufcles attached to different parts of their $\mathbb{K} \mathrm{kin}$, on which they alternately produce dilatations and contractions, which are the only motions of which they are fufceptible: but thofe which are capable of moving themfelves by fteps or otherwife, either wholly or partially, have their mufcles attached to hard parts placed externally or internally. Thofe parts perfonn the office of levers, and have points of fupport on each other, which are called their arliculations.

All the hard parts taken together form the fikcleton. When they are covered by the mufcles, they receive the name of bone; when they cover mufcies, they are denominated fhell, cruft, or fcale, according to their degree of confiftency. In both cafes they always enclofe vifcera, and determine the exterior form of the body, and the proportions of its different parts.
The articulations are provided with as many mufcles as ane neceflary for the difierent movemients of which they are fufceptible; each mufcie moving the bone to which it is attached, in its proper direction. They may be regarded as the moving powers. Their force, the point of their infertion, and the length and weight of the parts attached to the lever they have to move, determine the velocity and the duration of the motion they are capable of producing. On thefe different circumliances depend the force of leaping, the extent of flight, the rapidity of running, and the prehentile power poifleffed by different feccies of amimals; but, as we have already obferved, all this organization would remain immoveable, were it not animated by the nerrous fyllem.
The foft white fubftance which forms the effence of this fyltem, is divided into filamens that approach each other, aud unite in bundles, which contain more flawents in proportion as they are traced nearer to the common fafciculus of all the nerves, called the fpinal marrow, the anterior extremity of which is juined to the brain, that is to fay, to a medullary mafs of more or lefs magnitude, and differently formed according to the various kinds of animals.
From the action of external bodies on our own, we perceive that the nerves affected by that action communicate with the common fafeceulus, and that it communicates with the brain. A ligature or a rupture intercepts the phyfical. communication, and deftroys fenfation.
The only fenfe which befonge generally to onll animals, and which perkades almolt the whole furface of the budies of each of them, is that of feeling. It refides in the extremities of the nerves which are diftributed to the 1 kin , and makes us fenfible of the refiltance of bodies, and their temperature.

The other fenfes. feem to be only modifications of this Qne,

## L. I F E.

-ne, but more exalted, and capable of receiving more delicate impreffions. Every one knows that the other fenfes are feeing, which refides in the eye; hearing, which belongs to the ear: fmelling, which is attached to the membranes rithin the nofe; and talting, the feat of which is in the furface of the tongue. Thefe fenfes are almolt always fituated in the fame extremity of the body which contains the brain, and which we call the head.

Light, the vibrations of the air, the volatile emanations which float in the atmofphere, and faline particles foluble in water, or faliva, are the fubltances which act on thefe four fenfes; and the organs, which tranimit the action to the nerves, are appropriate to the nature of each. The eye prefents traniparent lenfes to the light, which refract its rays. The ear offers membranes and Huids to the air, which receive its concuffions. The nofe inhales the air which is to go to the lungs, and feizes, in their pafare, the odoriferous vapours it contains. Finally, the tongue is covered with fpongy papillx, which imbibe the favory liquids that are taken into the mouth.

By thefe means we obtain a knowledge of what paffes around us: but the nervons fyftem likewife makes us acquainted with a great deal of what pafles within us. Irdependently of thofe internal pains which indicate fome diforder in our organization, and the difagreeable itate in which we are placed by hunger, thirit, and fatigue, it is in confequence of the operation of this fyftem that we experience the agonies of fear, the emotions of pity, the defires of love. Seniations of this laft kind feem, however, to be rather the effects of the re-action of the nervous fyltem, than immediate impreffions; though, at the fight of any imminent danger, we halten to aroid it before it appears that the mind has had time to act; and the fame oblervation applies to the tranfports we fiel on the prefence of a beloved object, or to the tears we fhed over the fpectacle of fuffering virtuc. 'Thefe effects of the nervous fyltem are produced by numerous communications which particular nerves, called /ympathstics, eltablifh between different branches of the general trunk, by means of which the impreffions are tranfinitted more rapidly than by the brain. The knots called ganglia, when they are confiderable, are each a kind of fecondary brain ; and it is obfervable, that they are larger and more numerous in proportion as the principal brain is lefs.

The faculty of feafation, and that of contraction, the firlt of which, in molt animals, is exclufsely appropriated to the nervous fubltance, and the fecond to the flelhy fibre, appear to be equally diffufed in all the parts of certain gelatinous animals, in which we cannst perceive either fibres or nerves.

It is by the means of thefe two faculties that animals feel, defire, and are enabled to provide for their wants. The molt irrefiltible feeling of all is that of hunger, which conftantly reminds the animal of the neceflity of procuring new materials fur its nutrition. This third function-commences in the mouth, into which the aliments are taken, and, when they are folid, malticated and moiltened with diffulving liquors; thence they traverfe the alimentary canal, which is longer or thorter, and more or lels convoluted and dilated in different animals, and the parietes of which are compofed of feveral continuel tunics, analogous to thofe which form the external tersments of the body.

Thefe coats act in a mechanical manner, on the fublances which they contain, by flight contra@tions of their fibres; and in a clemical manner, by the liquors which are poured out within them.

The firit dilatation of the alimentary canal is called the nowach. There are fometimes feveral ftomachs, or feveral
divifions of that organ; its parictes yield a liquid which reduces the aliments to a homogeneous pulp, during the time they remain in it. 'The remainder of the cawal is more particularly called bowels or inteltines. Independently of the juices, which the different coats of the bowels produce, there are fome which are foparated from the mals of the blood by glands, and which penetrate the intellinal canal by particular conduits. The molt remarkable and the molt general of thefe glands are the liver and the pancreas. 'The tirt, which recretes the bile, is always of a con derable fize; and befides the effect of its liquid on the inteflines. produces another very remarkable effect on the biood itfelf, from which it removes feveral priticiples. See Stomacir, Intestines, Liver, and Pancueas.

It is in the intellines that the aliments undergo that change which fits them fur nutrition. The nutritive part is abforbed, during the act of digellion, tither by the porcs of the canal itfelf, in animals that have no circulation, or, in thofe that have, by very fmall vefficls which conduct it into the general fyftem of nutritive veffels. Thofe fmat veffels are called lymphatics. They are very diftinet from the yeins, in animals whofe ftructure moft refenbles that of man: in the more inferior animals they become gradually more like the veins, and cannot be dilinguifted from them in thofe which have whice bloud. The membranes which compofe the lymphatic veffels and veins are thin, and without apparent fibres. Internally they are furnithed with valves, all opening in the direction in which the fluid they convey has to flow, that is to fay, towards the heart. The arteries, on the contrary, ase ftrong and mufcular, bur have no valves; the vigorous impulfe of the heart is fufficient to imprefs a conltant direction on the blood they contain.*

But the chyle, or the liquor produced by digeltion, is not fufficient for renewing the venous blood, and rendering it fit for the nutrition of the different parts of the body. It is neceffary that it fhould experience the contact of the air before it enters into the arterial fyftem. This is effected by refpiration. The organs of refpiration, in animals which have blood-veffels, conlift in a ramification of thofe veffels, which increafes their furface to fuch a degree, that almoft all parts of the fluid are feparated from the furrounding element only by a very thin pellicle, which cannot obtlruet its action. Whis ramilication takes place on the furface of certain folds or lamello in aquatic animals, and on that of certain cells in aerial animals. In the firit cafe the organ is denominated branchis, in the fecond lunrs. In animals which have no veffels, the air reaches all parts of the body, and acts on the nutritive fuid at the fame moment in which that fuid combines with the parts of the body which it is deftined to nourifh. This is the cafe with infects that have trachece. It will be eatily conceived that there mult be mufcular organs, appropriated to each of thofe fpecies of refpiration, deltined to attract or impel the ambient fluid towards the place where it has to act upon the blood. This office is performed by the ribs, the diaphragm, the mufcles of the abdomen, the llaps of the gills, and feveral oiher parts, according to the nature of the animal. Sec Luxg.

The air cannot be employed in the formation of the voice, except in the animals that refpire by cellular lungs, becaufe it is in them only that it enters by a lingle and lengthened tube. At one or two parts of this tube there are membranes fiifceptible of tenfion, which vibrate when the air acts upon them, and thereby produce the various founds which we call the voice. The animals which have no voice, properly fo called, are not, however, deprived of the power of producing certain founds, but they are produced in them by other ineans. See Lamynx.

The blood, on its paffige into the organ of relpiration, experriences a kind of combuttion, which removes a part of its carbon, carrsing it off under the form of carbonic acid, and which thereby augmente the proportion of its other clements. The eflect of this procefs on the refpired air, is to deprive it of its oxygen, which is the only aeriform fluid that can be ferviceable to refpiration. Its effect on the blood is lefs known: we know that it heightens the colour of the blood in red-blooded animals, and gives it the power of exciting the hear to contraction. There is even reafon to believe that it is this action of the air on the blood which gives, indirectly, to the flefhy fibres their contractile power. It is thill necelfary that the blood fhould lofe feveral ether principles: fome arc carried off by the kidnies, which fecrete the urine, and which are found in all amimals that have red blood. The matter which tranfpires through the poras of the fing, and the fubftances whicl pafs through the intettinal canal, a great part of which are carried away with the excrements, relieve the blood of other principles. Thefe three kinds of excretions, to a certain degree, fupply the place of each other, and appear, therefore, to tend towards one cominon object. See Integuments, Fidney, and Respirition.

Thefe are all the organs which conftitute the animal; confidered individually, and which are fufficient for its feparate exiltence, while the object is not the multiplication of the fpecies: fuch are the whole of the organs in the higher orders of animals. We fhall fee that, in proportion as we defcend in the fcale of being, they fucceffively difappear, and that at laft we fhall find, in the loweft claffes, only what is neceffarily comnected with the idea of an animal ; that is, a fac, fenfible, moveable, and capable of digefting.

Upon a clofe obfervation of the action of all thefe organs, it will appear, that all the operations which take place in the animal body, depend on the combination and decompofition of the fluids contained within it. To the animal prom cefs, by which one fluid is feparated from another, or is formed from a part of the elements of one, mixed with a part of thofe of another, we give the name of fecretion: this term, hovever, is ufually confined to the changes which take place in different kinds of glands, that is to fay, in bodies more or lefs thick, in which the blood-veffels, being infinitely fubdivided, permit the liquid which the gland feparates from the blood to tranfude from their extremities. (Sce Gland.) But the animal economy exhibits a number of other transformations, or feparations of humours, which equally merit this name. It cannot be fuppofed that the nerves act on the nufcular fibres wittout producing a chemical change on the fluid that may be contained in the one, by the acceffion of that which the others may tranfmit, nor that external objects act upon the nerves otherwife than by producing a change of the fame kind. The fluid contained in the nervous fyftem mult have been feparated from the blood in the brain, and, in general, in all the medullary organs. The blood itfelf does not attain its thate of perfection until a mul. titude of fublances have been detached from it by the lungs, the kidnies, the liver, \&c. and until after it has received a number of others which have been feparated from the alimentary mafs by the lacteal veffels: on the other hand, this mafs is not capable of yielding chyle until it has in its turn received different liquors which have been fecreted from blood by feveral organs; and the blood only nourintes the parts to which it is dittributed, by the particles that are detached from its mafs, while other particles are feparated s.om thefe parts to return into the mafs of the blood shrough the medium of the lymphatic veffels.
in 2 word, all the amimal fusctions appear to reduce them.
felves to the 'transformation of Quids. In the manner in which thefe transformations are produced, the real fecret of the admirable economy of animals confilts, as health depends upon their perfection and regularity.

If we do not perceive this procefs in a manner fufficiently clear when the embryos of new individuals begin to develope themfelves within or without the bodies of their mothers, we can at leaft difcover it in the preparation of the male liquor, which, by its prefence, excites or occafions that developement in all the fpecies in which copulation is neceffary. This developement takes place in the fame manner as the ordinary growth. It, therefore, comes under the general rule.

The organs of generation, which alone remain to be noticed, are thofe which prepare the prolific liquor, and convey it to the ova, and thofe which are deftined to contain and protect the embryo during its developement. The firt conttitute the male, the fecond the female fex.

The telticles are the glands which fecrete the feminal fluid; feveral other glands prepare liquors which mingle with it. The peris contains the feminal canal ; it fwells by the accumulation of blood when the nerves are excited by defire: by that means, it is rendered capable of penetrating the vagina, which leads to the matrix, or to the ovidutius, and of conveying thither the fluid deftined to vivify the ova. The oviduct or tube receives the ovum at the moment in which it is detached from the ovarium; and conducts it without the animal if it be of the oviparous kind, 'or into the matrix if it be viviparous. The little embryo developes itf flf, and draws its nourifhment, either from the body of ite mother, by the abforption of a large tiflue of veffels connected with thofe of its own body, or from an organized mafs attached to it in the fame manner, and which forms the yolk of the egg, or the vitellus. When the embryo attains a certain flate, the matrix expels it; or it breaks the fhell of the egg in which it is contained, and efcapes from its prifon. See Genfration.

Viezv of the principal diferences which animals exbilit in their feveral organs.-It appears from the preceding account, that what is common to each kind of organs, confidered in all animals, refolves itfelf into a very fmall compafs, and that frequently they only refemble one another in the effects they produce. This is particularly obvious with refpect to refpiration, which is performed in the different claffes of animals by organs fo various, that their ftructure prefents no common point of comparifon. Thofe differences in the organs of the fame kind are precifely the object of comparative anatomy; and the fhort expofition we are about to make, of the principal of thefe differences, may be regarded as a general view of this fubject. We fhall, therefore, return to each of the-functions of which we have treated, and examine the different degrees of energy it poffefes, and the particular means by which it is carried on in different animals.

The organs of motion prefent us at firit fight with two important diftinctions with refpect to their fituation. Sometimes the bones form an internal fkeleton, articulated and covered by the mufeles; fometimes there are no internal bones, but merely fcales or fhells which cover the fling, within which are the mufcles: in other cafes there is no hard part that can ferse as a lever or point of fupport for the motions of the animal's body.
A nimals of the firit kind have the whole body fupported by a itrong pillar, formed of feveral bony pieces, placed one above the other, and called the fpine of the back, or the vertebral column. They are, therefore, denominated sertebral animals. Thefe are the mammalia, birds, reptiles, and fiflles.

The animals without vertebre are either entirely foft, or bave

## LIFE.

have their bodies and members enveloped in fcales articulated on one another, or, finally, are enclofed in fhells. Thefe are the foft worms, infects, and the teltacea.

It is by the greater or lefs perfection of certain parts that the animals of there different claffes become fufceptible of various kinds of motion.
The organs of fenfation prefent confiderable varieties; fome have a relation to the internal part of the nervous fyftem, others to the external fenfes. The firit give rife to three clafes:-that of animals which have no apparent nervous fyltem, and in which we difcover neither veffels nor nerves; fuch are the zoophytes or the polypes:-that of animals in which there is only the brain above the alimentary canal, and which have all the remainder of the common bundle of nerves fituated underneath, and contained in the fame cavity with the other vifcera; thefe are the mollufca, the cruftacea, infects, and a part of the articulated worms:-laltly, that of animals in which the common fafciculus of the nerves is fituated entirely in the back above the alimentary tube, and enclofed in a canal which paffes through the vertebral column; thefe are all the vertebral animals. Their ganglia are placed on the fides of their medullary cord, or difperled in the large cavities. Among the invertebral animals there are fome that have ganglia only in the large cavities, as the molluica, and others, which have them all on the medullary cord itfelf, of which they appear to be fwellings; thofe are the infects, and fome articulated worms.

The differences in the external fenfes confift in their number, and in the degree of energy that belongs to each.

All vertebral animals poffefs the fame fenfes as man.
Sight is wanting in the zoophytes, in fereral kinds of articulated worms, in feverai larve of inicets, and in the acephalous mollufca. Hearing does not exit, at leaft we have not yet difcovered its organ, in forme mollufca and infects. The other three fenfes, but particularly thofe of tafte and touch, appear never to be wanting.

But each of thefe fenfes may vary confucrably in the degree of its fufceptibility, and the complication of its structure. The perfection of the fenfe of tonch, for example, depends upon the delicacy of the external teguments, and on the divifion of the extremities that more particularly enjoy that fenfe; their formation rendering them capable of being apphied more or lefs exactly to the bodies of which the animal wifhes to acquire a knowledge. Above all, it is in the number and flexibility of the fingers and toes, and the fmallnefs of the claws or nails, that the anatomift difcovers important charafters.
The eyes may be more or lefs moveable, more or lefs covered, and more or lefs numerous. The cars may be funk within the cranium, or expofed outwardly; or they may be provided with an external trumpet, which collects: the rays of found. The membranes in which the fenfe of fmelling relides, may be more or lefs extenfive : thofe which are the feat of taite, may be more or lefs delicate and humid; -but it is only by particularly confidering each of thofe fenfes, that we can take a comprehenfive view of the differences that exift in the various clalles of animals.

The organs of digeftion exhibit two important differences in their general difpofitions. In certain animals, (in the greater part of zoophytes, ) the inteftines form a fac with only one aperture, which ferves at once for the entrance of the aliments, and the iffue of the excrements: all other animals have two diftinct apertures, for thofe purpofes, at the two extremities of the fame canal; but the convolutions of this canal may be fuch as to remove thefe openings
to a greater or lefs diflance from each other. Another difference which has much influence on the nature of the aliments appropriated to each fuecies, is, that in certain animals the mouth is armed with weth, or hard farts proper for grinding folid fubftances, while in others they do not exitt. In the latter cafe, the animal can only fwallow whole bodies if its mouth be large, or merely fuck in fuids if its mouth be in the form of a tube. The flructure of thofe tecth has icfelf much influence on the fubftances the animal can fubmit to mattication. The remainder of the alimentary canal varies alfo confiderably in its ftructure, according to the different fubftances which the month convers to it. On this likewife depend the length of the canal, and the number of fomachs, cæca, \&c.

The chyle produced by the action of the digeffive organs on the alimentary fubflances is tranfmitted to the various parts of the body in two different ways. It either finply tranfudes through the parietes of the inteftinal canal, to bathe all the interior of the body, or it is abferbed by particular veitcls which convey it into the mafs of the blood. The firtt is the mode in which this operation is performed in zoophytes, and, probably, alfo in common infects, which appear to have no kind of veffels proper for circulation. As to the other animals, viz. the mollufca, and the verte. bral animals, that have abforbent veffels, they exhibit two new differences. The latter have red blood, and the ly mph and chyle white. Almoft all the others have thefe two fluids of the fame colour.

Vertebral animals differ among themfelves, with regard to the colour of the chyle, which is white and opaque in the mammalia, and tranfparent, like the other lymph, in birds, reptiles, and fifhes. The three laft claffes, therefore, have no conglobate glands in their chyliferous veffels, while they are very numerous in the firft.

The circulation of the blood is accompanied with very important differences in its organs. In the firlt place, there are animals which have no circulation whatever, viz. in. fects and zoopbytes: others have a doubie, and others a fingle sirculation. We call that a double circulation in which no part of the venous blood can enter the arterial truuk, until it has paffed through the organ of refpiration, which is generally formed of the ramifications of two veffels; the one arterial, the other venous; each nearly as large, but not fo long, as the tivo principal veffels of the body. Such is the circulation of man, of all mammalia, of birds, fifhes, and a number of mollufca.

In the fingle circulation a great part of the venous blood re-enters the arteries without paffing through the lung; becaufe only one branch of the arterial trunk is expanded upon that organ; fuch is the circulation of the amphibia.

There are, befides, other differences in the hearts, or muf. cular organs, deltined to give impulfe to the blood. In the fingle circulation there is only one beart; but when the circulation is double, there is fometimes an organ at the bafe of the aorta, and alfo at that of the pulmonary artery. At other times it is at one of the two only.
In the one cafe, the two hearts, or rather the two ventricles, may be united, as in man, mammalia, and birds; or they may be feparate, as in the cuttle fifh.

Where there is only one ventricle, it may be placed at the bafe of the artery of the body, as in fnails, and other mollufca; or at the bafe of the pulmonary artery, as in fifles.
The organs of refpiration are likewife diftinguifhed by a number of remarkable differences. When the element that atts on the blood is the atmofpheric air, it penetrates even

## LIFE.

into the interior of the refpiratory organ ; bat when that element is water, it fimply glides over a furface more or lefs multiplied.
The lamelle which compofe the organ, in the latter cafe, are called brancbic. They are found in fifhes, and in a number of molluica: inftead of lamellix, we fometimes find fringes or tufts.

The air either enters the body by a fingle aperture, or by feveral. In the firft cafe, which is that of all animals that have what is properly called lungs, the canal, which receives the air divides into a number of branches, terminating in as many frall cells, that are ufually united into two maffes, which the animal has the power of comprefling or dilating at pleafure.

When there are feveral apertures, which is the cafe only with infects, the veffels that receive the air are ramified $a d$ infuitum, and convey it to all parts of the body without exception. This we call refpiration by trachere.

Lally, the zoophytes, if we except the echinodermata, have no apparent organ of refpiration.

The organs of the voice prefent only two differences, which may be regarded as general. They depend on the pofition of the glottis, in which the found is formed. In birds, it is at the luwer part of the trackica or tube, which condacts the air, whare it divides into its two branches to pafs into the lungs. In quadrupeds and reptiles it is fituated in the beginuing of the trachea, at the root of the tongue.

Only thefe three claffes have a glottis; but the other animals produce founds by different means. Sometimes they employ the friction of certain elattic parts; fometimes they beat the air with other parts, or produce a rapid motion in certain portions of air, which they fomewhere retain in their bodies.

Gencration gives rife to varieties of two kinds. The one relates to the actions which occafion it, the other to the refult.

In a finall number of animals, belonging almont entircly to the clafs of zoophyta, generation is performed without copulation, and the young animal grows on the body of the parent, like a flyot on a tree : others only produce in confequence of copulation, and are thercfore provided with two fexes; but thefe two fexes may be feparate in different individuals, or united in the fame. It is only in the mollufca and zoophyta that this laft cafe occurs: all animals with vertebrx, and infects, have the fexes feparate.

Hermaphrodite animals, fuch as the bivalve fhell-fifh, generate fingly ; in others, a reciprocal copulation takes place, each of the two indivinuals performing the functions of mate and female: this is the cafe with the fnails and other mollufca that crawl on the belly.

The produce of generation is either a bud which developes itfelf iato an animal, remaining fome time on the body from which it proceeds, and of which it forms as it were a branch; or it is a foctus, which unfolds itfelf in the uterus of its mother, to which it is connected by a plexus of velfels, and from which it comes forth alive; or, finally, it is a feetus inclofed in a thell, with a fubftance adhering to it by velfels which it muit abforb before it is difcharged. Thefe are the gemmiparous, viviparous, and oviparous modes of generation.
The firft occurs in fome zoophytes, and in fome articulated worms? the fecond in man and other mammalia oniy; the third is common to all ofler animals; and when their young come forth alive from the bouly of the mother, as is
the cafe with the viper, it is becaule the eggs are hatched ix the oviduct.
Laftly, if we confider the ftates through which the young animal is obliged to pafs before it becomes, in its turn, capable of perpetuating its fpecies, we again difcover two principal differences. Some have at their birth the form which they will always preferve, with the exception of a few inconfiderable parts which have yet to difclofe themfelves, and to change their proportions: the others, on the contrary, have a form altogether different from their perfect ftate, and not only have to produce and unfold new parts, but muat lofe their old ones: thefe are the animals which undergo a metamorphofis. Hitherto this change has only been obferved to take place among infects, and among the reptiles without fcales, that is fay, frogs and falamanders.

Such are the chief varieties which the organs belonging to the feveral functions of animals exhibit.
We have, however, yet to notice one very important variety which extends to feveral of thefe functions; it relates to the organs of fecretion. In the four claffes of vertebral animals, and in fome mollufca, thefe organs are glands, or at leaft expanfions of blood-veffels; the name of gland being particularly applied to them when they form maffes of fome thicknefs.

It is not fo in infects, which, inftead of fecretory organs, have only tubes more or lefs long, which attract into the fpongy texture of their parietes, that portion they have to feparate from the mafs of the nutritive fluid.
We are as yet little acquainted with the organs of fecretion in zooplyytes, if indeed they can be faid to have any paritcular organ for that purpofe.
Divifon of life into the animal and organic. -The preceding feetch has cxlibited to us a general view of life; when we come to examine it more in detail, it offers to us two remarkable modifications. One is common to vegetables and animals, the other peculiar to the latter. Compare together two individuals, one taken from each of thefe kingdoms: one exilts only within itfelf, has no other relations to furrounding objects than thofe of nutrition, is bern, grows, and perilles, atiached to the fuil, which received its germ. the other joins to this internal life, which it poffeffes in a ftill higher degree, an external life, which eftablihes numerous relations between it and the neighbouring objects, unites its exitence to that of other beings, and draws it near to or removes it from them according to its wants or fears. We might fay that the vegetable is the flkeleton of the animal, and that, in order to form the latter, it was only neceffary to ciothe the fleleton with an apparatus of external organs, culculated to eltablifh the neceflary relations. Hence it follows that the functions of the animal form two very dittinet clafies. One of thefe confits of an habitual fucceffion of affimilation and excretion; by which it is conttantly transforming into its own fubtance the particles of other hodies, and then rejecting them, when they have become ufelefs. liy the ottrer he perceives furrounding objects, reffects on his fenfations, performs voluntary motions under their influence, and generally can communicate, by the voice, his plesfures or pains, his defres or fears. By the one he lives only within himfelf; by the other he carries his exiltence out of the fphere of his own body.

I cull, fays Bichat, the functions of the former claft, taken altogether, the organic life, becaufe all organifed beinge, whether vegetable or animal, enjoy it in a mure or lefs marked degree, and becaufe organic jtructure is the only

## LIFE.

condition neceffary for its exercife. The affembled functions of the fecond clafs form the animal life, fo mamed becaufe it is the exclufive attribute of the anmal kingdom.

Generation does not enter into the feries of phenomena of thefe two lives, which relate entirely to the individual ; while that function regards the fpecies, and is confequently connected only in an indiret, manher to molt of the other functions. Its exercife does not begin until the others have been for a long time in action; and it is extinguifhed long before they ceafe. In molt animals its periods of activity are feparated by long intervals of entire inaction: and in man, where the remifiions are lefs durable, its relations to the other functions are not more numerous.

Each of the lives is compofed of two orders of functions, fucceeding each other, and mutually connected. In the animal life, the firlt order takes place from the exterior of the body to the brain; and the fecond, from the latter organ to thofe of locomotion and the voice. Objects affect fucceffively the fenfes, the nerves, and the brain. The firft receive, the fecond tranfmit, and the lalt perceives that impreffion which contitutes a 「enfation. The aninal is nearly palive in this firft order of functions; he becomes active in the fecond, which refults from the fucceffive operations of the brair, where volition arifes in confequence of fenfation, of the nerves, which tranfmit this volition, and of the locomotive and vocal organs, which are the agents of its execution. A double movement of compofition and decompolition exifts alfo in the organic life. Hence the amimal is not the fame at one time as at another : his organifation is unchanged, but the component elements are conitantly varying. The order of functions, which affimilate to the animal nutritive fubftances, confitts of digeftion, circulation, refpiration, and nutrition. All forcign matters undergo the influence of thefe four functions, before they belong to the elements of the body. After a certain time abforption removes them, and conveys them into the circulation, from which they are feparated by the cutaneous or pulmonary exhalation, or by the various fecretions. Thus abforption, circulation, exhalation, and fecretion, form the fecond order of functions in the organic life; or the order oppofed to aflimilation. The circulating fy fem is the common centre in the organic, as the brain is in the animal life. The blood confifts of two parts; one, furnihhed principally by the food, affords the materials of nutrition; while the other, contlituting the wreck or refidue of all the organs, fupplies with materials the fecretions and external exhalations. Yet the latter functions fometimes convey out of the body the products of digettion where they have never been employed in nourifhing the organs. This is exemplified in the urinary and cutaneous difcharges confequent on copious drinking

The moft effential difference that appears to exift between the organs of the animal and thofe of the organic life, is the fymmetry of the one and the irregularity of the other. This obfervation, indeed, does not apply to all animals; nor is it invariably true in man; but it holds good generally in the latter, and forms a triking general feature. Two globes exactly alike receive the imprefion of light. Sounds and odours have each their double organ. The median line is clearly marked on the tongue, and its two halves exatily refemble each other. This line is not very manifelt in the Ikin. The nerves, which tranfmit inpreflions from the fenfitive organs, are arranged in fymmetrical pairs. And the brain, in which the inpreflion is received, has a regular form; its double parts refemble each other on the oppofite lides; and its fingle organs are all fyonmetrically divided by the median line into two exactly correfpondiag halves. The
nerves, which tranfmit our volitions from the brain to the agents of locomotion and the voice; and the locomotive forgans, compofed of a great part of the mufcular fyltem, of the bony fyltem and its dependencies; and the larynx and its acceffory organs; the double agente for the execution of volitions, have a fymmetrical itructure throughout.
The mufcles and merves, when they do not belong to the animal life, no longer exhibit this regularity of form. The heart, and the mulcular coverings of the digettive vifcera, prove this with refpect to the mulcles ; and the great fympathetic nerve, every where employed in the internal life, clearly fhew the irregularity in the nerves.

On furveying the parts concerned in the organic life, we fhall find that an exactly oppolite charater is applicable to them. The itomach, the inte!tines, the fpleen, liver, \&c. are all irregularly forned in the digeftive fyttem. In the circulating apparatus, the heart, and the large veffels, fuch as the venx cave, the axygos, the vena portarum, \&c. exhibit no trace of fymmetry. Continual varieties are obferved in the blood-veflels of the extremities, and the difpofition of one fide is often by no means the fame with that of the other.

The refpiratory apparatus, at the firft glance, appears regular ; but we find the two branches of the trachea difimilar in fize, length, and direction ; the two lungs differing in fize and in the number of their lobes, \&cc. The organs of exhalation and abforption, the ferous membranes, the thoracic duct, and the right lymphatic trunk, as well as the other abforbing veffels, have every where an irregular diftribution.

Among the glands we fee the mucous follicles every where feattered irregularly. The pancreas and liver are out of all fymmetry : the kidnies differ in pofition, fize, \&c.

It is apparent, from thefe confiderations, that the organs of the animal life in man are effentia!ly characterifed by lymmetry; while thofe of the internal life have the conitant character of irregularity in their external furms.

It follows from this view, that the animal life is in a manner double; that its phenomena, exccuted at the fame time on the tho fides, form an independent fyltem on each fide, of which one may go on while the cther ceafes. This happens in thofe cafes of paralyfis called hemiplegia, where the animal life is annihitated on one fide of the body, fo that the individual has no relation to furrounding objects; while the prefervation of fenfation and motion on the other fide give him all the ufual powers. The median line in thefe cafes accurately dilting uifhes the found from the affected fide.
In the organic life, on the contrary, all the parts confpire to form one fyitem, fo that the functions of one fide cannot be interrupted without thofe of the other being affected. The liver on the left influences the flate of the fomachon the right; if the colon ceale to act on one lide, that of the other cannot go on ; the fame caufe that hould arrelt the circulation in the large venous trumks and the right fide of the heart, would flop it alfo in the left fide, and in the arteries, \&c. Hence, if all the organs of the internal life on one fide fhould have their functions topped ${ }_{2}$ thofe of the oppofite fide would neceffarily remain inactive, and death mult follow. This affiction, however, is general, and applies to the organic functions collectively; fome of the organs are in fact double, and may fupply each other's places, asthe kidney and lung.

Bichat proceeds to point out the differences by which the animal and organ:c lives are diftinguifhed when in a fate of action. He obferves that harmony is to the functions of the organs, what fymmetry is to their conformation; it
fuppofes

Suppofes a perfece equality of force and action, as fymmetry indicates an exact analogy between the external form and the internal fructure. It is a confequence of the law of fymmetry; for two parts, effentially alike in their ftructure, camnot att differently. This reafoning would lead to the general pofition, that harmony is the character of the external functions, and difcordance the attribute of the internal ones. He then euters at confiderable length into a detailed conlideration of this fubject; but docs not fucceed in proving the point to the extent afferted.

A more important diftinetive character of the two lives is drawn from the periodical intermiffions of the exterual functions, and the uninterrupted continuity of the internal ones. Whatever fufpends refpiration and circulation, fufpends and even annihilates life if it be continued. All the fecretions go on uninterruptedly; if fome periods of remiffion are ubferved, as in the bilc and faliva, when digeftion and maftication are not going on, thefe affect only the degree of activity and not the entire exercife of the function. Exhalation and abforption fucceed each other without ceaf. ing; nutrition is never inactive; the double motion, of compofition and decompofition, from which it refults, ends only with life.

In this concatemation of the organic phenomena, each function depends immediately on thofe which precede it. The circulation is the centre of the whole, and immediately connected with their exercife; if that is difturbed, the others linguifh; they ceale if the blood no longer moves. Thus, the numerous wheels of a clock ftop as foon as the pendulum, which fets them all in motion, is at rett. Not only is the general action of the organic life cornected to the particular action of the heart, but each function is allo feparately connected to all the others. Without fecretion there would be no digeftion; without exhalation, no abforption ; without digettion, no nutrition. We may, therefore, lay down as a general character of the organic fuictions, their continuity of action and mutual dependence on each other.

On the contrary, confider each organ of the animal life in the excercife of its functions; you will fee conftantly alternations of ativity and repofe, complete intermiffions, and not remifions like what may be feen in fome of the organic phenomena. Each fenfe, fatigued by a long cons:nuance of fenfations, becomes momentarily unfit for the reception of new ones. The ear is not excited by founds, ard the eye is clofed againit the light, merely becaufe the refpective functions have been exerted for fome time. Fa. tigued by a long exercife of the perception, the imagination, memory, \&c., the braitr requires a fufpention of action proportioned to the duration of the preceding activity, in order to recruit the powers, without which it could not again become active.

When a mufele has been contrafed flrongly, and for a confiderable time, it cannot perform new contraction until after a certain interval of relaxation. Hence there are intermitions in the exertions of the !ocomutive and vocal Fowers.

This internifion in the animal life may be either partial or general. The former is feen when a particular organ has been a long time in exercife, the others remaining inative; this organ then relaxes; it fleeps while the others are awake. Each animal function, therefure, is not in an immediate dependence on the others, as is the cafe with the organic functions. When the ienfes are clofed againlt external objects, the action of the brain may till continue; menory, imagination, and reflection, are then often excrcilcd. Lucomotion and the voice may hill remaun; when the lattes are interrupted, the func-
tions of the fenfes fill go or. The animal can fatigue any part feparately. Each, thercfore, fhould have the power of refting in order to recruit its forces feparately; this is the partial fleep of the organs. General fleep is the affemblage of thefe particular acts, and arifes from the law which we lave juft illuftrated.

Differences of the organic and animal lives in refpea to the vilal propertics.-Phyficians and phyfiologitts, in their writings on the vital powers, have generally begun by fearching for the principle on which they depend: they have wifhed to defcend from the fudy of its nature to that of the phenomena, inflead of afcending from the refult of obfervation to the conclufions which theory may fuggef. The foul of Stahl, the archreus of Van Helmont, the vital principle of Barthez, the nateria vitr of Hunter, with a long train of et ceteras, have been regarded in their turns as the fingle centres of all thofe actions which bear the character of vitality, and have fucceffively afforded the bafes on which ath phytiological explanations reft in the laft refult. Each of thefe has been fricceffively deftroyed, and nothing has keen preferved from their wrecks, except the facts afforded by experiment on the powers of fenfation and motion. So narrow are the limits of the human underftanding, that the knowledge of firft caufes feem placed for ever beyond our reach. The thick weil which covers them, envelops in its innumerable folds whoever attempts to break through it. In the fludy of nature, principles are certain general refults of firft caufes, from which innumerable fecondary refults proceed; the art of difcovering the connection between thefe primary and fecondary refults is the object of every judicious mind. To feek the connection between firt caules and their general effects, is like walking blindfold through a road from which we may ftray by a thoufand paths.

Moreover, how are we interefted in knowing thefe caufes ? is it neceffary that we fhould underftand the nature of light, oxygen, caloric, \&c., in order to ftudy the phenomena? Let us imitate, in the fcience of phyfiology, the examples of modern metaphyficians in their invefligations of the intellectual phenomena; let us fuppofe the caufes, and fix our attention entirely on the grand refults.

We may obferve in nature two clafles of beings, two claffes of properties, and two claffes of fciences. Beings are either organic or inorganic, properties vital or not vital, and fciences phyfiological or phyfical. Animals and vegetables are organic; minerals, inorganic. Senfibility and contractility are vital properties; gravity, affinity, elafticity, are non-vital properties. Animal and vegetable phyliology, and medicine, compofe the phyfiological fciences; attronomy, chemiltry, \&c. \&c. are phyfical fciences. Thefe two clafles, of fciences relate merely to phenomena. Two others, relating to external and internal forms, confequently defcriptive, correfpond to them; thefe are botany, anatomy, zoology, for organic ; mineralogy, \&c. for inorganic bodies.

From thefe properties are derived all the phenomena in each clafs of fciences. Whatever we fee in allronomy, hydraulics, dynamics, \&c. mult be ultimately referred through the concatenation of caufes, to gravity, elafticity, \&c. In the fame way the vital properijes are the mainfpring at. which we arrive, whatever phenomena we may be contemplating in refpiration, digeltion, fecretion, inflammation, \&c.

Each body poffeffes a certain number of propertics, which efpecially characterize it, and by virtue of which it concurs in its own manner in the production of the phenomena, which are fucceflively developed in the univerfe.

Obferve

## LIFE.

Obferve furrounding obje Cis ; carry your view towards the molt diftant; ufe the telefcope on the celeftial bodies moving in fpace, or penetrate with the microfcope into the world of thofe concealed from our view by their minutenefs ; you will conftantly fee inert bodics gravitating towards each other, living bodies alfo gravitating, but moreover feeling and performing a motion, which they owe only to shemfelves. Thefe properties are fo inherent in both, that we cannot conceive the bodies without them; to enjoy them and to exift mean the fame thing. Suppofe that they fhould be fuddenly ammihilated, all the phenomena of nature would initantly ceafe.

Differences between the vital properties and the phyfical porvers.-The extent of this difference cannot fail to itrike us on the firft glance. The vital properties, conftantly variable in their intenfity, often pafs with the greatelt rapidity from the lowett to the higheit degree of energy, are fucceffively exalted and weakened in the difierent organs, and affume, under the influence of the flighteft canfes, a thoufand different modifications. Sleep, exercife, reft, digeftion, hunger, the paffions, the effect of furrounding agents, \&c. expofe them at every inflant to numerous revolutions. The others, on the contrary, conftantly the fame at all times, give rife to a feries of phenomena always uniform. Compare fenfibility to attraction; the latter is always in proportion to the mals of the body, in which it is obferved, while the former is conftantly changing in the fame organ, in the fame mafs of matter.

The invariable nature of the laws which prefide over the phyfical phenomena, enables us to fubmit to calculation all the fciences of which they are the objects ; but the application of the mathematics to vital action can only lead to very general formulx. The refiftance experienced by a. fluid in paffing through a dead tube, the velocity of a projectile, \&c. may be eafily reduced to a fixed law ; but to calculate with Borelli the power of a mufcle, the velocity of the blood with Keil, the quantity of air entering the lungs with Irwine and Lavoifier, is like building on a mov-ing-fand an edifice which is folid in itfelf, but which quickly falls from the infecurity of its foundation.

From the circumftances juft explained, the vital and phyfical phenomena derive refpectively the characters of irregularity and uniformity. Inert fluids are known, when they have once been accurately analyfed; but one, or even many examinations do not inform us of the nature of the living fluids. Chemical analyfes give us, fays Bichat, the anatomy (Anatomie cadaverique) of them; but their phyfiology confifts in a knowledge of the innumerable variations which they exhibit according to the condition of the refpective organs. The urine differs as it is voided after a meal or after fleep; in winter and in fummer: the mere paflage from a warm to a cold temperature alters its compofition: it is not the fame in the child, the adult, and the old man ; in the male and in the female; in a quiet flate of the mind and in the agitation of paffion. Add to thefe differences the innumerable alterations produced by difeafe. Thefe facts prove that the organs mult undergo continual changes in their mode of action, to produce correlpondent variations in the fubltances feparated from the blood.

The fcience of organized bodies thould be treated in a manner entirely different from thofe, which have inorganic matter for their object. We fhould employ a different language; fince words tranfported from the phyfical fciences to the animal or vegetable economy conftantly recal to us ideas not at all connected with the phenomera of that fcience. If, fays Bichat, men had cultivated phyfiology before natural philofophy, inttead of after it, we cannot doubt that Vor. XX.
they would have difcovered numerous applications of the former to the latter; that they would have defcribed rivers flowing by the tonic action of their banks; cryftals formed by an excitement of the reciprocal fenfibilities of the particles ; planets moving by their mutual irritation at great diftances, \&c. All this would appear to us very unreafonable, as we fee gravity only at the bottom of thefe phenomena: is it more rational to have recourfe to gravity, chemical affinity, and a language entirely founded on thefe fundamental data, in a fcience where their influence is moft obfcure? Natural philofophy, chemiltry, Scc, are comećted, becaufe the fame laws regulate their phenomena: but a valt interval feparates them from the fcience of organifed bodies, becaufe a wide difference exifts between their laws and thofe of life. To call phyfiology the natural philofoply of animals can only lead to inaccurate notions: as well might we denominate altronomy the phyfiology of the ftars.

Difference between the wital properties and thofe which arife from organifation -The properties of any living organ are of two kinds : the one immediately connected with life, beginning and ending with it, or rather forming its principle and effence ; the other connected to it only indirectly, and appearing rather to depend on the organifation, on the texture of the part.
Senfibility, and the power of contracting, are vital properties. Extenfibility (the capability of being ftretched), and the power of recovery, when the extenfion has ceafed, are properties refulting from organifation. The latter derive an increafed energy from life; but they ftill remain in the organs when life has ceafed, and decompofition is the ondy termination of their exiftence. We fhall confider firft the vital properties.
Of the animal and organic fenfibilities. The vital properties are reduced to thofe of perceiving or feeling (fenfibility), and moving (contractility): each of thefe has a different character in the animal and organic lives. In the latter, fenfibility is only the capability of receiving an impreffion: in the former, it is the capability of receiving an impreffion, with the additional power of referring it to a common centre, or confcioufnefs. The flomach is fenfible to the prefence of food, the heart to that of the blood, and an excretory tube to the contact of its proper fluid: but this power ends in the organ itfelf. The organs of fenfe, the mucous furfaces at their origins, the nerves, \&c. are fenfible to the impreffions of bodies which touch them, and moreover tranfmit thefe impreffions to the brain, which is the general centre of the fenfibilities of thefe various organs.

Thus we have an organic and an animal fenfibility. On the former depend all the phenomena of digeftion, circulation, fecretion, exhalation, nutrition, \&c. it is common to plants and animals; the zoophyte enjoys it as well as the molt perfectly organifed quadruped. From the latter flow the fenfations, perception, and pleafure and pain, whick modify them. The perfection of an animal is in proportion to the degree in which he enjoys this fenfibility. It is not an attribute of vegetables.
The difference in thefe two modifications of fentient power is well marked in the mode of their termination in fudden deaths. The animal fenfibility is immediately extinguifhed. There is no trace of this faculty left in the inftant which fucceeds a powerful concuffion of the brain, a great hemorrhage, or an afphyxia : but the organic fenfibility ftill fubfilts for a longer or fhorter time. The lymphatics ftill abforb: the mufcle quivers when pricked; the nails and hairs even feem to grow. All traces of this fenlibility are not deftroyed until after an interval, occafionally of canfiderable length.

## LIFE.

Yet the effential nature of thefe two powers is probably the fame. In many parts they are connected together and fucceed each other in an infenfible manner; as we may obferve in the origins of the mucous membranes. We are fenfible of the palifage of the food through the mouth and the pharynx: this fenfation becomes weaker in the beginning of the cfophagus, almoit ceafes in the middle of that tube, and difappears at its lower extremity and in the ftomach, where the organic fenfibility alone remains. The urinary and generative organs exhibit exactly the fame phenomenon; there is animal fenfibility near the flkin; it gradually diminifhes, and becomes at laft organic in the interior of the organs.

Different ftimuli, applied to the fame organ, excite in it one or the other of thefe fenfibilities. When ligaments are cut, or irritated by acids or alkalies, they do not tranfmit to the brain the flrong impreffions which they receive. But, if they are twifted, diftended, or torn, acute pain is the confequence. The blood circulates in the arteries without our feeling it, but injcct an extraneous fluid, and the cries of the animal fhew that he is fenfible to the impreffion.

We daily obferve inflammation, by increafing the organic fenfibility of a part, transform it into animal fenifibility. Cartilages, ferous membranes, \&c. which, in their ordinary \&ate, have only the obfcure fenfibility neceffary for their nutrition, become endued, when inflamed, with animal fenfibility, often more acute than that of the organs, in which it refides habitually. Inflammation accumulates the vital properties in a part, and thereby changes the organic into animal fenfibility, which differs from if only in degree.

The diftinction now explained does not arife from the nature of the faculty, which is every where the fame; but is founded on the different modifications of which it is fufceptible. The power is common to all organs, and forms their true vital character; but it is diftributed in different proportions, and beftows a different mode of exiftence on each. In thefe varieties there is a certain meafure, below which the excited organ alone receives and perceives the fenfation; and above which it is tranfmitted to the brain.

Although each organ exhibits continual varieties in its fenfibility, yet it feems to poffefs originally a certain proportion, to which it always returns after thefe alternations of augmentation and diminution. This proportion conflitutes the proper life (vita propria) of each part, and fixes the nature of its relations to thofe bodies, which are foreign to it, but which often come in contact with it. The falivary, pancreatic, and biliary ducts, having a proportion of fenfibility exactly analogous to the nature of the fluids which pais through them, admit thofe readily, but reject all others. The larynx refufes admiffion to every thing except the air. The excretory tubes are in contact, on the mucous furfaces, with various fluids that pafs over thefe furfaces, but they never allow them admiffion. In the fame way the lacteals, which open on the furface of the inteltinal canal, abforb chyle only, and not the fluids which may be mixed with it. Thefe relations do sot exift only between the different proportions of fenfibility in the organs, and the various animal fluids; they may alfo take place between external matter and the parts of the animal frame. The particular fenfibility of the bladder and kidnies, and of the falivary glands, eftablifhes the relations between thefe organs and cantharides, mercury, \&c.

It may be enquired, why nature, in the diftribution of the different proportions of fenfibility, has beftowed this property only in inferior degrees on the internal organs, or thofe of the interior life, while the has fo abundantly pro-
vided with it the external organs? why, confequeintly, exch organ concerned in digettion, circulation, refpiration, nutrition, abforption, does not tranfmit to the brain the impreffions which it receives, while all the acts of the animal life fuppofe this tranfmiffion? The reafon feems to be, that all the phenomena, which eftablifh our relations to far: rounding beings, mult be, and are in effect, under the influence of the will, while thofe, which are fubfervient to the purpofes of affimilation, ought to be exempt from that influence. To make a phenomenon dependent on the will, we mult be confcious of it: to exempt it from the influence of that power, this confcioufnefs muit not exitt.

Of the animal and organic contraatilities.-Contraction is the molt common form of motion in the animal organs. Some indeed move by dilatation, as the iris, corpus cavernofum, \&c.; but we know as yet fo little of this kind of motion, that we fhall confine our remarks entirely to the former.

Spontaneous motion, a faculty inherent in living bodies, prefents, like fenfibility, two great modifications diftinct from each other, as we obferve it in the phenomena of the two lives: thefe are the animal and the organic contractility: The former, fubject to the will, has its origin in the brain, ceafes to exit when the organs no longer communicate with the brain, and participates in all the affections of that part: It refides exclufively in the voluntary mufcles, and prefides over the function of locomotion and the other movements, and the voice. The latter, not dependent on any common centre, has its origin in the part, is not connected with any voluntary acts, and produces the phenomena of digettion, circulation, fecretion, \&c. Like the correfponding fenfibilities, they are effentially diftinguifhed in violent deaths, which fuddenly annihilate the animal contractility, allowing the organic ftill to exert itfelf for a longer or fhorter time. The fame difference is obferved in afphyxia, which fo much refembles death: the animal contractility is entirely fufpended, the organic ftill continuing active. In paralyfis alfo, voluntary motion is deftroyed, while the organic movements ftill go on.

Thefe two kinds of contractility are connected to their correfponding fpecies of fenfibility. The fenfations produced by external objects bring the animal contractility into exercife: and before the organic contraction of the heart takes place, its fenfibility has been excited by the conitact of blood.

Yet the connection is not the fame in the two cafes. The animal fenfibility may be excited, without the analogous contractility being neceffarily brought into action: but the two other powers are never feparately exercifed. The excretory tubes immediately re-act when the fecreted fluids are brought into contact with them: the arrival of blood in the heart is neceeflarily followed by its contraction. This conjunction is fo conftant, that authors have included both powers in one name. Irritability defignates both the fenfation excited by the contact of any body, and the contraction of the organ when it re-acts.

There is a very fimple reafon for this difference. In the organic life nothing intervenes between the two faculties in their exercife; the fame organ is the point at which the fenfation terminates and the contraftion begins. In the animal life, on the contrary, the two acts are feparated by middle functions, thofe of the nerves and brain, which, if they are not exerted, interrupt the communication. In the fane way we explain this further difference; viz, that there is always a ftrict proportion between the fenfation and the contraction in the organic life, while they may be feparately exalted or diminifhed in the animal.

Two varieties of the organic contrazility.-The animal con• tractility

## LIFE.

eractility is always nearly the fame, in whatever part it may exitt; but the organic difplays two effential modifications, which might feem to indicate a difference of nature, although there is only a diverfity of external appearance. Sometimes it may be obferved very difinctly, while, on other occafions, although it really exifts, infpection alone cannot appretiate it.

Senfible organic contractility may be feen in the heart, ftomach, inteltines, bladder, \&c.: its action is exerted on the animal fluids in confiderable maffes.

It is by virtue of the infenfible organic contractility, that the excretory tubes act on their refpective fluids, the fecretory organs on the blood which they receive, all parts that are nourifhed on their nutritive juices, the lymphatics on the fubitances applied to thefe orifices, \&cc. Whenever the fluids exift in fmall maffes, where they are minutely divided, this fecond kind of contractility is developed.

We may illuftrate the difference between them, by comparing one to the attraction, which is exerted between large maftes of matter, and the other to the chemical affinities, which take place between the component particles of an aggregate. Barthez compares them to the motions of the hands of a watch : that, which marks feconds, moves round the circumference in a very obvious manner; the hour hand moves alfo, although we cannot perceive its motion.

The fenfible organic contractility correfponds nearly to what has been called irritability; the other to the tonic power, or tonicity. Thefe two words are objectionable, becaufe they indicate a diverfity of nature in the two properties. The common term which we employ, defignates their general character, that of belonging to the internal life, and of being independent of the will; while the additional epithet expreffes the peculiar attribute of each. This view of the matter is confirmed by the fact, that the two properties are connected by infenfible gradations. Between the obficure, but real contractility neceffary for the nutrition of the hair, nails, \&cc. and that which we fee exerted in the motions of the inteftines, ftomach, \&c., there are many fhades which form the tranfition; fuch as the motions of the dartos, of the arteries, of fome parts of the kin.
'lhe circulation will ferve to give us an idea of the gradual tranfition from one to the other kind of organic contractility. In the heart and large veffels, this function is regulated by the fenfible kind; it becomes lefs and lefs apparent, in proportion as the diameter of the veffels diminifhes; and it is laftly infenfible in the capillaries where tonicity alone is obfervable.

T\% confider, with moft authors, irritability as a property exclufively belonging to mufcles, and conftituting a character by which they are diftinguifhed from other organs, and to exprefs this property by a name indicating this exclufive feat, is taking a confined and erroneous view of the matter. The mufcles undoubtedly occupy the firft rank in this refpect; they poffefs the greateft fhare of organic contractility. But every living organ re-acts, like them, though in a lefs apparent manner, on ftimuli artificially applied, or on the fluids which it receives, and which bring to it the materials of fecretion, nutrition, exhalation, or abforption.

Hence nothing can be more uncertain than the rule commonly adopted for deciding whether a part be or be not of a mufcular nature; a rule which confifts in examining whether it contracts under the action of natural or artificial ftimuli. From this mode of judging, a mufcular coat has been affigned to the arteries, although their organization is throughout unlike that of the mufcles; the uterus has been pronounced to be mufcular, although there are great dif,
ferences between it and any mufcles; and a mufcular texture has been admitted in the dartos, iris, \&c.

This faculty of contraction, like fenfibility, is unequally diftributed in the organs; and thefe differences, like thofe of fenfibility, appear to be only differences in degree.

If we were to defignate any kind of contraction in the mufcles by a particular term, it would be their animal, rather than organic contractility; fince they alone, of all parts in the body, move under the influence of the brain. This property is foreign to their tiffue, and is derived entirely from the latter organ.

The two kinds of contractility cannot be changed, like the two fpecies of fenfibility. The organic is never tranfformed into animal ; however its intenfity may be increafed, it is ftill of the fame nature. The fomach and inteftines are often fo fufceptible, that the dighteft caufe will produce violent motions; but thefe are never influenced by the brain.

The extenfibility and coniracility arifing from organization.Thefe properties depend entitely on the organic arrangement of the parts of the frame. They fucceed and are connected to each other, and are in a ftate of mutual dependence, like the vital phenomena of fenfibility and contractility.

The extenfibility of tiffue, or the power of elongation beyond the ordinary fate, from a foreign impulfe, belongs in a very fenfible manner tơ a great number of organs. The extenfor mufcles are remarkably lengthened where the limbs are bent to the greateft degree; the $\{\mathrm{kin}$ gives way and is ftretched to envelop tumours; aponeurofes are diftended by fluids accumulated under them, as in afcites and pregnancy. The mucous and ferous membranes prefent analogous phenomena. The fibrous membranes and even the bones are fufceptible of this diftention; as, for inftance, the dura mater, cranium and pericranium in hydrocephalus, the extremities and middle of the long bones in the various affections of thofe organs; the kidnies, brain, and liver, in abfceffes of their interior, the fpleen and lung when diftended with blood, the ligaments in hydrops articuli; in a word, all organs, under a thoufand circumftances, offer to us innumerable proofs of this property, which is inherent in their tiflue, but not dependent on life. It fubfifts, as long as the organic ftructure remains, even for a long time after life has become extinct. Putrefaction, decompofition, and whatever affects the organic tiffue, are the only caufes that deftroy the exercife of this property, in which the organs are always paffive, and experience a mechanical influence from the various bodies which act on them.

We may draw out a fcale of extenfibility for the different organs. At the top are placed thofe which lave the moft foftnefs in the arrangement of their fibres; as the mufcles, fkin, cellular tiffue, \&c.: at the bottom thofe characterized by coufiderable denfity, as the bones, cartilages, tendons, nails, \&c.

A particular mode of contractility correfponds to this extenfibility; it may be called the contractility of tillue, or contractility through the ceffation of extention. For its exertion in any organ, it is only neceffary that the extenfion thould ceafe. Ordinarily, molt of our organs are maintained in a certain ftate of tenfion by particular caufes; the loconotive mufcles by their antagonifts; the hollow mufcles, by the various fubftances which they enclofe; the veffels by the fluids which circulate in them; the fkin of one part, by that of the neighbouring organs; the alveoli of the jaws by the teeth, \&c. Now, if any of thefe caufes ceale to act, contraction immediately takes place; divide a mufcle, and its

## LI FE.

antagonif will be fhortened; empty a hollow mufcular organ, and it will contract; prevent an artery from receiwng blood, and it will be converted into a ligament; cut the flin, and the edges of the incifion will be drawn afunder; remove a tooth, and the focket will be obliterated.

In all thefe cafes contraction follows the ceffation of a natural extenfion; in other inflances it is the confequence of the ceffation of an unnatural extenfion. Thus the abdomen is reduced after parturition or paracentefis; the cellular tiflue after the opening of an abfcefs; the tunica vaginalis after the operation for hydrocele; the flkin of the fcrotum after the removal of a large difeafed tefticle ; and aneurifmal facs after the evacuation of the contained fluid.

This kind of contractility is perfectly independent of life; like the extenfibility, it is comnected only to the tiffue or organic arrangement of parts; but the vital powers beltow on it increafed energy ; thus a divided mufcle retracts much lefs in the dead than in the living 1tate. It terminates only by the diforganization of the parts from decompofition, \&c., and not by the annihilation of their vital propertres.

Moll authors, as Haller, Blumenbach, Barthez, \&c., have confounded the phenomena of this contractility with thofe of the organic infenfible kind, or tonicity; they refer the reduction of the abdomen after its diltention, the retraction of the divided kin , and the corrugation of the fcrotum by cold, and the crifpation of parts by certain poifons, Hlyptics, Sc. to the fame principle. The two former phenomena belong to the contractility of tiflue, which never fuppofes the application of irritants; the latter to tonicity, which is never exerted without their influence.

In order to render the diltinctions, which we have made on this fubject, more clear, let us felect for oblervation an organ in which all the kinds of contractility are united; a voluntary mufcle for example. This mufcle acts, Ift, through the influence of the nerves, which it derives from the brain; this is the animal contractility; 2dly, by the application of a chemical or phyfical ftimulus, which produces in it a general movement analogous to thofe which naturally belong to the heart and other involuntary mufcles; this is the organic fenfible contractility or irritability; 3 dly, by the arrival of fluids, which convey the materials of nutrition to all its parts, and which excite motion in every fibre and particle, -a motion indifpenfible to the function of nutrition, as it is in the glands to fecretion, in the lymphatics to ab-
forption, \&c.; this is the infenfible organic contractility or tonicity ; 4 thly, by the tranfverfe fection of its fubfance, producing retraction of the divided ends towards their points of infertion; this is the contractility of tiffue. Each of thefe properties may be leparately deltroyed in a mufcle; divide its nerves and the animal contracility ceafes, although the two organic kirds ftill fubfift. Apply opium to it, and ftimuli will no longer excite it to motion, although the tonic movements determined by the contact of the blood fill remain. Kill the animal, or intercept all the veffels which go to the limb, and the tonic powers will be deftroyed, leaving only the contractility of tiffice, which does not ceafe until gangrene or putrefaction, the confequences of deftroyed vital action, appear.

This example. will enable us to appretiate the different kinds of contractility in organs, where they exitt in fmaller number than in the voluntary mufcles, as in the heart or inteltines, which have all the kinds except the znimal ; in the white organs, as the tendons, aponeurofes, bones, \&zc., where the infenfible organic contractility and that of tiffue only are found. In general, the two latter belong to all organs, the former belonging exclufively to fome particular ones. We may therefore felect tonicity, or infenfible organic contractility, as the general character of all living parts; and the contractility of tiffae as the common attribute of all parts, whether living or dead, which are organically compofed. The latter property, like the extenfibility of tiffue, to which it correfponds, has its different degrees; the mufcles, fkin, cellular fubitance, \&c. on one part, and the tendons, aponeurofes, and bones, on the other, form the two extremes of the fcale.

It will be eafily feen, from what we have juft faid, that in the contractility of any organ two things are to be confidered; viz. the power and the caufe which brings that power into exercife. The power or the contractility is always the fame, connected to, and inherent in the organ; but the caufe which determines its exercife varies greatly, and hence the various kinds of contraction. Confequently, the diftinctive epithets fhould be applied rather to the contraction, which expreffes the effect produced, than to the contractility which indicates the principle or caufe.

The general refult of the preceding remarks on the vital properties, is exhibited in the following table, which prefent all thefe properties in one point of view.

The peculiar motions of the iris, corpora cavernofa, \&c. and the dilatation of the heart, are not included in this view, becaufe our ideas on the relations which connect thefe to the other kinds of motion, and the differences which diftinguifh them, are not yet fufficiently clear.

From the properties which have juft been explained, all the functions, all the phenomena of the animal economy, may be deduced; we may refer them all, in ultimate analy, fis, to one or the other, as we conflantly arrive, in the confideration of phyfical phenomena, at the fame principles, viz. attraction, elarticity, \&c.

Wherever the vital properties are in activity, a difengagement of caloric takes place, peculiar to the animal, and compofing for it a temperature independent of that of the medium in which it lives. The word caloricity, or calorification, is improper to exprefs this phenomenon, which is a general effect of the two great vital powers in exercife, and does not fow from any particular faculty. We do not fay digeftibility, refpirability, \&c. becaufe refpiration, digeftion, and other proceffes, are the refults of functions deduced from the common laws: the production of heat is in the fame cafe. The digeltive force of Grimaud is an expreffion

## LIFE.

preflion equally objeetionable. The aflimilation of heterogeneous fubllances to our organs is one of the grand refults of fenfibility and contractility, and not a peculiar property. The fame obfervation will apply to the formative power of Blumenbach, that of fixed fituation of Barthez, and to the various principles admitted by numerous authors who have attributed to functions, or refults, names that indicate laws, or vital properties.

In the article Embryo we have given a fketch of the ftate of the two lives in the foetus: we fhall add here a fhort view of the changes which occur after hirth.

A new mode of exiftence commences as foon as the child has quitted the uterus: various functions are added to the organic life, and the animal, which has not yet begun, comes into exercife, eltablifhing relations, hitherto unknown, between the individual and furrounding objects. While the organs of the internal life act at once in a perfect manner, thofe of the external require a kind of education, and arrive only by degrees at that perfection which they exhibit in the fequel. The fenfations are at firft confufed, and offer only general images: habit gradually deadens thefe firlt impreflions, and then the particular fenfations come to be diftinguifhed, after long and repeated exercife. Thus a man, introduced for the firft time to the magic fpectacle of an opera, perceives only a whole which pleates him ; and he gradually feparates the fources of pleafure arifing from the dancing, the mufic, the decorations, \&c. The education of the brain in this refpect refembles that of the fenfes: all the mental faculties dependent on its action acquire very gradually the degree of precifion to which they are deftined. Perception, memory, and imagination, which are always preceded and determined by fenfation, are enlarged in proportion to their employment. The judgment, of which they are the triple bafis, at firft affociates irregularly notions which are themfelves irregular: its exertions are foon diftinguifhed by greater clearnefs; and they become at laft rigorous and precife.
The voice and locomotion prefent the fame phenomena: the cries of young animals confift, at firt, of one unformed found, without any diftinct character. Age gradually modifics them; and, after repeated exercife, they acquire the characters peculiar to each fpecies. It is unneceffary to mention fpeech, as that is fo evidently the refult of education.
The mufcles of the newly born animal are in continual action ; but progreflion, or even ftanding, cannot be effected. Habit muft teach the art of connecting together particular contractions for the production of certain effects. Until this period has arrived, there is a vacillation in all the motions, paricularly the general ones, which almoft deprives the child of the power of locomotion.

It is obvious, then, that we are obliged to learn the art of extending our exiftence beyond ourielves; that the exterior life acquires trefh developement every day, and demands a kind of apprenticefhip, which is not obferved in the organic life.

Society exercifes a remarkable influence on this kind of education which the external organs undergo: it enlarges the fphere of action in fome, contracts it in others, and modifies it in all. The occupation in which an individual is habitually employed, almoft always exercifes one particular organ more than the others. The ear of the mufician, the palate of the cook, the brain of the philofopher, the mufcles of the dancer, the larynx of the finger, \&c. have, befides the general education of the external life, a particular education, which frequent exercife carries to a high degree of perfection. Hence, the mufician and painter become able to diftinguifh in a harmony, or a pieture, what efcapes vulgar obfervation. In fome inftances, this perfection of
adion in an exercifed organ is accompanied by an excefs of nutrition, as in the occupations where particular member. are exerted greatly and habitually.
It is no lefs true, that when one organ is confantly occupied, the others are inactive, and appear to lofe in capability what the other gains. The philofopher who fpend. his life in his ftudy, and devotes himfelf to abitract meditations, condemns his locomotive organs to inactivity, and hence lofes the facility of exerting thein: the dancer is in the oppofite ftate. The obfervation of man in fociety will lead us every moment to fimilar remarks: perfection of action in the locomotive organs fcarcely ever coincides with that of the brain or fenfes; and vice verffa. This obfervation naturally leads to a fundamental principle of focial education; wiz. that we fhould never direct the attention to feveral ftudies at once, if we with to fucceed in each; that it is vain for any individual to cultivate various departments of human knowledge and exertion with an expectation of fhining in each; and that in general the fecres of excelling in any one, is, to be inferior in all the relt. For a more detailed account of thefe views, which are not, per. haps, ftrietly phyfiological, fee Bichat, fur la Vie et la Mort, p. 121-130.

When the child quits the womb of the mother, its organic life undergoes a remarkable developement : feveral functions, which did not exift before, are now brought into exercife; and thofe which had begun become niore enlarged, But the organs, in either cafe, require ne education: they exhibit at once a degree of perfection, which thofe of the animal life arrive at only after frequent exercife. Digeftion, refpiration, a great part of the exhalations, and abforptions, begin at birth: after the firlt acks in the refpective organs, they proceed with as great facility as they will ever after poffefs. The glands, which had been hitherto inactive, or at lealt had produced a very fmall quantity of fluid, are excited by various applications to their excretory ducts. The paffage of food over the openings of the falivary ducts, of the chyme over the pancreatic and biliary tubes, \&c. ftimulates the refpective glands. The excretions now alfo begin : all thefe phenomena are at once executed with precifion, and no education is required in the organs which exhibit them.

As all the organs of the internal life act perfectly at once, none can acquire in the fequel a fuperiority over the others, as in the animal life. Yet it is common, even here, for one fyftem to predominate over the reft: fometimes the blood-veffels, fometimes the pulmonary fyftem, fometimes the galtric organs, and particularly the liver, are exerted beyond their due proportion, and give a peculiar character to the temperament. But the foundation of thefe differences feems to be laid in original difference of Atructure: and the fame is the cafe where one fyftem is remarkably weak.
"Such, then, concludes Bichat, is the leading difference of the two lives, in refpect to the degree of perfection of the various fyitems of functions of which each contits: in the animal, predominance or inferiority of one fyltem arifes from the greater activity or indolence of that fyltem; in the organic, the original conformation is the caufe. Hence, the phyfical temperament and the moral character cannot be changed by education, which has fo vaft an effect in modifying the animal life. The character, if I may ufe the expreffion, is the phyfiognomy of the paffions; the temperament is that of the internal functions: as both are conitantly the fame, and not influenced by habit and exercife, they cannot be affected by education. That may, indeed, beftow fuch perfection on the judgment and reflection, as to make them more powerful than the paffions: it may fortify the animal life, and make it fuperior to the impulfes of the
-rganic: But to attempt altering the character, foftening or exalting the paffions, of which it is the habitual expreffion, or enlarging or contracting their fphere, would be an enterprife analogous to that of permanently raifing or diminifhing the extraordinary force of the heart, or accelerating or retarding the motions of the arteries in the ftate of health. We fhould inform any perfon who entertained the latter project, that circulation and refpiration are not under the influence of the will, and cannot, therefore, be modified by the individual, without the occurrence of difeafe. The fame obfervation will apply to thofe who think they can change the character, and confequently the paffions; fince the latter are the produce of the actions of all the internal organs, or, at leaft, are efpecially feated in them."'

For the mode in which the functions ceafe, the connections of the animal and organic life to each other, and the reciprocal influences of the heart, brain, and lungs, fee Deatir. Cuvier, Leçons d'Anatomie comparée, tom. i. Bichat, Recherches Phyfiologiques fur la Vie et la Mort ; and his Anatomie Generale, in the Confiderations Generales.

Life of Mind, vita mentis, as contra-dillinguifhed from life of body, vita corporis, is held, by the Cartefians, to confilt in a perpetual cogitation, or uninterrupted courfe of thinking ; which feems likewife to have been Ariftotle's meaning; when
 thinking being the only proper act of the mind. But. Mr. Locke endeavours to refute this principle. See Thinking and Soul.
Ltee of Man, vita bominis, confifts of a continued communication of body and mind; or in operations, to which both the motions of the body and ideas of the mind contribute.

Thus, e. gr. the mind now thinking of fomething, on occafion of that thought there arifes a certain motion in the body: and now, again, the body moves firtt, which motion is followed by fome thought of the mind.

In fuch alternate or reciprocal operation does the life of man confift; confidered, as he is a compound of body and mind. See Sensation and Motion.
Life is more particularly ufed for the duration of an animal's being ; or the fpace of time that paffeth between its birth and death.
Life, confidered as an object of Law. See Rights. See alfo Homicide.
Life-Annuities, are annuities, the payments of which depend on the continuance of any given life or lives; and they may be diltinguifhed into annuities to commence immediately, and annuities to commence at fome future period, or reverfionary life-annuities.

The value of a life-annuity is properly the fum that will be fufficient to enable a feller (allowing for the chances of mortality) to pay the annuity without lofs; and, fuppofing money to bear no intereft, it is always equal to the expectation of the life.
For example : -Obfervations fhew, that according to the mean probabilities of the duration of human life, the expectation of a life aged ten is nearly forty years; or, in other words, that a fet of lives at this age will, one with another, enjoy forty years each of exiltence, fome of them enjoying a duration as much longer as others enjoy a fhorter. It is obvious, therefore, that fuppofing money to bear no intereft, 4ol. in hand for each life, would be fufficient to enable a feller to pay to any number of fuch lives $1 /$ o per ann. for their whole duration; or, in other words, that 401 . is, on this fuppofition, the value of a life aged ten.
But if any improvement is made of money by putting it -ut to intereft this will be more than the value; becaule it will be more than fufficient to pay the aniuity ; and as much more than fufficient as the improvement or the interelt is
greater. If, for inflance, any fum now in hand may be fo improved, by being put out to interefl, at 4 per cent. as to double itfelf in eighteen years; the feller of fuch an annuity will (in confequence of putting out half the purchafe-money to intereft) find himfelf, at the end of eighteen years, in pof. Feffion of $42 \%$. or of $20 \%$ more than is fufficient to pay the remainder of the annuities, though he fhould make no farther improvement of the purchafe-money. If he puts out the money to higher intereft he will be a greater gainer; if to lefs, he will be a lefs gainer: but at any rate of intereft he muit be a gainer. The truth is, that fuppofing the intereft to be that jult mentioned, or 4 per cent. and all the improvement poffible made of the money at this interelt, he will find ${ }^{17 \%}$ 10s. 6 d . for each annuity (inftead of $40 l$.) to be fufficient to enable him to make all his payments. (See the tables at the end of this article.) But that if he improves the money at 5 per cent. he will find $15 \%$. to be fufficient.

It may feem to follow from hence, that we have nothing to do to find the value of a life-annuity, but to find the expectation of the life, and then to take out of the common tables the value of an annuity certain for a term of years equal to the expectation; and it may appear ftrange that this fhould not give the true value.

The truth is, that it will give the value greater than it is; or that a lefs fum than that found in this way will be fufficient to pay the annuity. Suppofing the intereft 4 per cent. the value of an annuity certain for forty years is 19l. i6s. (fee Tab. III. Annuities) ; but the value of a life aged ten, at this rate of intereft, is, as hath been juft faid, no more than 1\%\%. ros. $6 d$. The principal reafon of this is the difference between the value of forty payments of an annuity to be made every year regularly one after another, till in forty years they are all made; and the value of the fame number of payments to be made at greater diftances of time from one another, and not to be all made till the end of feventy or eighty years. In this laft cafe there is more time given for the improvement of the purchafe-money, and therefore a lefs. fum will be fufficient to enable a feller to make his payments. All that is learned from knowing the expectation of a number of lives, is the mean number of payments that will be made to each of them, and not the time in which they will be made. For example :-The expectation of a life at ten being forty years, it follows that to a hundred lives at this age, forty payments for each life, or four thoufand in all, will be made. But, as all the lives will not be extinct in lefs than feventy or eighty yearì, many of the payments will not be made till after the expiration of forty years; and, therefore, a part of the purchafe-money will be improved for a longer time than forty years. In general, it may be obferved that one-balf nearly of the payments of a fet of life-annuities will be made after the expiration of a term of years equal to the expectations of the lives; and that this half having a longer time for accumulation than the expectations of the lives, the value of the lives muft be lefs than the value of annuities to be paid regularly every year for a time equal to the expectations. Thus 1980l. will, in confequence of being improved at 4 per cent. pay a hundred annuities of 1l. for forty years. But a lefs fum (or 1750\%.) will pay a hundred fuch annuities to a fet of lives whofe common expectation is forty years; becaufe one-balf nearly of the payments will not be made till after the end of forty years, and fome not till after the end of feventy or eighty years; and confequently one-balf nearly of the purchaie-money will be improved for more than forty years, and fome of it for more than feventy or eighty years.

Thefe obfervations demonftrate, that it is a miftake to reckon the value of a life-annuity the fame either with the value of an annuity certain for a term of years equal to the

## LIFE-ANNUITIES.

expectation of the life; or with the value of an annuity for a term certain, equal to that which a life has an even chance of exiting. This is an error into which fome have fallen, but it only proves their utter ignorance of the fubjcet.

The true method of computing the values of life-annuitics may be explained in the following manner. Let us fuppofe that the duration of the annuity is to be only one year. That is, that $1 \%$ is to be paid a year hence, provided a hife now of a given age fhould be then in being. Were it certain that this life would not fail in the year, the value of the annuity would be the fame with the value of it payable a year hence, or with the fum which, now put out to intereft, would increafe to Il , in a year; and this fum, fuppofing interelt at 4 per cent. is 19s. 3 d. See Tab. II. Annuities.

But the payment not being to be made, fhould the life happen to fail in the year, this fum ought to be diminifhed in proportion to the degree of the uncertainty of the life's continuing to exit through the year; and it is ealy to fee that this uncertainty ar chance is in the proportion of the number of perfons at that age living at the end of the year, to the number living at the beginning of it, as fhewn by obfervations. For example :-if it has been found in any fituation that but half the number of perfons of the given age living at the beginning of the year, are living at the end of it, the uncertainty will be as half; and the value juft mentioned ought to be leffened one-half. If it appears that two-thirds, or nine-tenths, or ninety-nine hurdredths, are living the end of the year, the fame value mult be diminifhed only onethird, one-tenth, or one-hundredth. That is, it will be neceflary to multiply it by $\frac{1}{3}, \frac{9}{10}$, or $\frac{99}{100}$. Univerfally then, the prefent value of any fum to be paid a year hence, provided a given life fhould be then exifting, is that fum multiplied by the value of $1 \%$. payable at the end of the year (taken out of Tab. II. under the article Annuities), and alfo by the fraction formed by making the number of the living at the age of the given life (taken out of the Table of Obfervations) the denominator, and the number of the living at the next fucceeding age (or at the end of the year) the numerator. For example:-let the value be fought of $1 / 0$ payable a year hence, if a child aged ten fhould be then living, reckoning intereft at 4 per cent. The value of 1 l. reckoning this intereft, and payable a year hence, is (as hath been juft faid) 19s. 3 d . or (in decimal parts of a pound,) .9615. (See Tab. II. under the article Annuities.). The number of the living at the age of ten (in Tab. III. at the end of this article) is 5675 ; and at the next fuccecding age (or eleven) is 5623. It follows, therefore, that according to this table, out of 5675 living at the age of ten, only 5623 are living at the end of the year: $\rho$, in other words, that the chance or probability of a life aged ten exiting through the year is as $\frac{5623}{5675}$, which fraction, therefore, multiplied by .9615 , gives the value fought, or .9526 equal to $19 \mathrm{r} . \circ \frac{\mathrm{x}}{2} d$.

Again, let us fuppofe that the duration of a life-annuity of Il . is to be two years, or that one payment of Il . is to be made a year hence, provided a given life fhould exilt a year, and a fecond payment of the fame fum at the end of two years, provided the fame life fhould be in exittence at the end of two years. The method of finding the value of the firlt payment has been already explained; and by the very fame reafoning it may be eafily difcovered, that the value of the fecond payment muft be the value of 11. payable at the end of two years, diminifled in proportion to the uncertainty that the given life will exift two years; or (which is the fame) multiplied by the fraction formed by making the num.
ber of the living at the given age the denominator, and the number of the living at the next fuccecding age but one, of at the end of two years, the numerator.

Thus. Let the value be required of $1 \%$. payable yearly for two years, provided a child aged ten fhould live two years, reckoning intereft at 4 per cent.
The value of the payment at the end of the firft yoar has been juft found to be .9526 in decimal parts of a pound, or 19s. $\mathrm{O}_{2} \mathrm{~d}$ d.
The value of the payment at the end of the fecond year is the value of $1 \%$. payable two years hence, leffened by the uncertainty that a life aged ten will live two years ; or in the proportion of the number of the living in the T'able of Obfervations at the age of twelve to the number of the living at the age of ten. That is, it is .9245 the faid value of 11. payable at the end of two years, taken out of 'lable II. under the article Annuities) multiplied by the fraction $\frac{5573}{5675}$, or .9078, equal to 18 s .2 d . (See Table III. at the end of this article.) To this, add the former value, or 95261 . and the total, or 1.8604 , will be the value of both payments, or of an annuity of $1 \%$, on a life aged ten for two years.

By proceeding in this way it will appear that the value of the fame annuity for three years is $.8889 \times \frac{5523}{5675}+1.8604$ $=2.725 \%$ and for eighty-fix years (or the whole duration of life, according to the Table of Obfervations) $17.5238 \%$. It is evident, that in the fame method the value of an annuity of 1 l . on a life at any other age is to be found; and that fuppofing the annuity any other fum than $1 l$. its value will be this fum multiplied by the value of an annuity of 1 l.
The calculations of the values of life-annuities may be otherwife explained in the following manner. Suppofe a life-annuity of $1 \%$. payable yearly to every one of 5075 perfons, all now aged ten, the firt payment of which is to be made a year hence. It appears from the Northampton Table of Obfervations (or Table III. under the article Expectation), that only 5623 of thefe perfons will be living at the end of the year; and confequently, that the money then to be paid will be only 5623 . The prefent value, therefore, of the firf payment of the annuities will be the fum which being now put out to intereft will increafe in a year to $5623 l$. That is, it is 5623 l. difcounted for a year, or 54061 . 14s. 3od. for this fum added to its interelt for a ycar (reckoned at 4 per cent.) will juit make up 5623 l . From the fame Table of Obfervations, it appears farther, that of 5675 perfons living at ten years of age, only 5573 will be living at the end of two years. The prefent value, therefore, of the fecond payment of the annuities will be the fum, which being now put out to compound intereft at 4 per cent. will increafe to 5573 l . in two years. The fum is 5152 l .5 s . In like manner 5523 , 5473,5423 , \&c. being the number living at the end of three, four, five, \&c. years, the value of the third, fourth, fifth, \&c. payments of the annuities will be $5523 l .5+73$ l. 5423 l . \&c. difcounted for three, four, five, \&c. years refpectively, and continued to the year in which all the lives become extinct. The total of all thefe values is $99.443 l$. which, therefore, is the fum that would be fufficient, if improved at 4 per cent., to make good the payment of an annuity of $1 \%$. for life to every one of 5675 perfons aged ten, according to the Northampton Table of Obfervations. The value, therefore, of fuch an annuity payable to only one of this number, mult be the $5675^{\text {th }}$ part of 99,443 l. or $17 \%$. sos. 6 d.

## LIFE-ANNUITIES.

In the Table of Obfervations, from which the examples here given have been taken, and alfo in the table framed by Dr. Halley, from the bills of mortality at Breflaw in Silcfia, it may be obferved, that the numbers dying every year out of a given number born, continue in the middle itages of life nearly the fame for many years together. It was this circumfance that led M. De Moivre to form his hypothetis of an equal decrement of life through all its ftages after ten. In this hypothefis, the limit or utmolt probable extent of life is fixed to the age of eighty-fix; and out of any number living at a given age an equal number is reckoned to die every year, till at eighty-fix all the lives become extinet. Thus, for inftance, if there are feventy-fix perfons living at ten, one of them by this hypothefis will die annually during the term of feventy-fix years, at the end of which time the laft furviving life will have failed. Or, in other words, feventy-five will be living at the end of the firt year, feventyfour at the end of the fecond year, feventy-three at the end of the third year, and fo on for feventy-fix years; from whence it follows that the probability of one perfon's living to the end of the firit, fecond, or third year will be $\frac{75}{76}, \frac{74}{76}$, $\frac{73}{76}$. \&c. refpectively, where it appears that the fractions, and confequently the probabilities they exprefs, decreafe arithmetically. The number of years which a life wants of the age of eighty-fix is in this hypothefis called the complement of the life, and half this complement is always the expectation of the life. That is, according to what has been already faid, it is the number of years which one with another a fet of lives at that age will exilt; or, as the writers on this fubject fometimes fpeak, it is the Jbare of life due to each of them.

It is extremely eafy to calculate the values of life-annuities on this hypothefie. For by what has been jult faid, the value of an annuity on a life aged ten, is the fum of the feries $\frac{75}{76} \times .9615+\frac{74}{76} \times .9245+\frac{73}{76} \times .8889$, \&c. continued to $\frac{1}{76} \times .0527 \%-.9615 \%-.9245 \%-.888 \mathrm{gl} .8 \mathrm{cc}$. and $.0527 l$. being the values (reckoning interelt at 4 per cent.) of 11. payable at the end of $\mathrm{r}^{\prime}, 2,3,8 \mathrm{c}$. to 76 years; or, calling 1. with its intereft for a year, $r$, and $76, n$, the value of the life is $\frac{n-1}{n r}+\frac{n-2}{n r^{2}}+\frac{n-3}{n r^{3}}+, \& \mathrm{c} .=\frac{1}{r}+\frac{1}{r^{2}}+\frac{1}{r^{3}}$ $\ldots .(n)-\frac{1}{n r}-\frac{2}{n r^{2}}-\frac{3}{n r^{3}} \ldots . .(n)=$ $\frac{1}{r-1}-\frac{r}{n \cdot \frac{r-1}{r-1}} \times \frac{1}{\frac{1}{r-I}}-\frac{1}{r^{n} \cdot r-1}$. But $\frac{I}{r-I}$ is
equal to the perpetuity, and $\frac{I}{r-I}-\frac{I}{r^{n} \cdot r-1}$ is equal to an annuity certain for $n$ years, therefore we have the following rule:
"Find in Table III. under Annuities, the value of an annuity of $1 /$ certain for a number of years equal to the complement. Multiply this walue by the perpetuity increafed by unity, and divide the product by the complement. The quotient fubtracted from the perpetuity will be the value."

The complement in the prefent cafe being 76 , the value of an annuity for 76 years being (fee Tab. III. Annuities) 23.7311 , and the perpetuity 25 , the value of a life aged 10,
will come out 16.88 r . In the fame manner may the value of a life at any other age be computed according to this hypothefis: and thefe values are the fame with thofe in M. De Moive's table of the values of lives.
But it is a neceffary obfervation, that in the firft and laft Atages of life, this hypothefis differs too much from fact: which may be eafily feen, by comparing it with the follow. ing tables of the probabilities of human life. It had better therefore be entirely rejected from the doctrine of annuities, efpecially as we are now furnifhed with correct tables, deduced from real obfervations, of the values both of fingle and joint lives. The labour and difficulty of forming fuch tables are alfo greatly leffened by means of an eafy theorem given by Mr. Simpfon in his book on the Doctrine of Annuities; and fince by Dr. Price in his Treatife on Reverfionary Payments. We fhall here give the explanation and proof of this theorem from Mr. Morgan's Treatife on Amauitics and Affurances, chap. ii. \$2." 'P. 56.
" Were it certain that a perfon of a given age would live to the end of a year, the value of an annuity of $s l$. on fuch a life would be the prefent fum which would increafe in a year to the value of a life one year older, together with the value of the fingle payment of $1 /$. to be made at the end of a year ; that is, it would be 1!. together with the value of a life aged one year older than the given life, multiplied by the value of 1 l. payable at the end of a year. Call the value of a life one year older than the given lifé N , and the value of 21. payable at the end of a year $\frac{1}{r}$; then will the value of an annuity on the given life, on the fuppofition of a certainty that it will exilt a year, be $\frac{1}{r}+\frac{1}{r} \times N$. But the fact is, that it is uncertain whether the given life will exilt to the end of the year. This laft value, therefore, muft be diminifhed in the proportion of this uncertainty; that is, it mult be multiplied by the probability that the given life will furvive one year, which fuppofing $\frac{b}{a}$ to exprefs this probability, will make it $\frac{b}{a r} \times \overline{1+N_{0}}$ "

The great utility of this theorem will appear from the following examples. Suppofe the probabilities of life as they are given in the third of the following tables, or the tables of obfervations for Northampton, and the rate of intereft 4 per cent., or $r=1.04$. By reafoning in the manner already explained, the value of a life aged 95 will be expreffed by the fingle fraction $\frac{1}{4} \times .9615=.2403$. The value of a life one year younger, will, by this thcorem, be $\frac{4}{9 \times 1.04} \times \overline{1+.2403}=.5300$. The value of a life two years younger, by the fame theorem, will'be $\frac{9}{16 \times 1.04}$ $\times \overline{1+.5300}=.82701$. The value of a life three years younger, or at the age of $9^{2}$, will be $\frac{16}{24 \times 1.04} \times$ $\overline{1+.8270}=1.171 \%$. If we proceed in this manner, the value of every younger life will be deduced from that next preceding; nor will the number of multiplications neceffary to determine the values (agreeably to any table of obfervations) of all lives, at all ages, much exceed the number of thofe which mult otherwife have been ufed for finding the fingle value of the youngeft life. See Table VI.

Mr. Morgan, after having given this account of the fore-
going theorem, and explained the method of verifying all the operations in proceeding by it from one life to another, applies the theorem to the calculation of the values of joint lives, and gives a fimilar method of verifying all thote operations.

But inftead of following him in this, we fhall refume our account of the general principles un which the values of lifeannuities are calculated. We have already explained thefe, as far as annuities on Gingle lives are concerned. From the fame principles the method of finding the value of annuitics on the joint continuance of any two lives, may be underftood. Suppofe the ages of two perfons to be 50 and 60 . It appears in Table III. that of 2857 perfons living at 50 , only 2776 will live to be 51 ; or, in other words, that the probability that a perfon at this age will live a year, is $\frac{2776}{2857^{\circ}}$ Alfo, it appears from the fame table, that the probability that a perfon aged 60 will live to 61, is $\frac{1956}{2038}$. The probability, therefore, that they will botb live a year, (or the former ts be 5 I , and the latter 61, ) is the product of thefe two probabilities, or $\frac{2776}{2857} \times \frac{1956}{2038}=\frac{5429856}{5822566}$. For it is well known, that the probability that any two in dependent events will both happen, is always the product ariling from multiplying the probability of one event by the probability of the other.

In like manner, the probability that the former of thefe lives will live to be $52,53,54,8 \mathrm{cc}$. and the latter to be $62,6_{3}, 6_{4}, \& \mathrm{c}$. or that they will both live two, three, four, \&cc. years, is by the fame table $\frac{2694}{2857} \times \frac{1874}{2038} 3$ $\frac{2612 \times 1793}{2857 \times 2038}, \frac{2530 \times 1712}{2857} \times \frac{172038}{20}$, \&c. And according to the reafoning already ufed, thefe probabilities multiplied by the values (in T'able II. Ansuiries) of il. payable at the end of one', two, three, four, \&c. years, will give the prefent value of the firtt, fecond, third, fourth, \&c. payments of an annuity dependent, on the joint continuance of the two lives; and the fum of thefe products for one, two, three, four, Sxc. years, will be the value of an annuity of $1 \%$. on the joint continuance of the two lives for one, two, three, four, $\& c$. years; and if the products are continued to the extremity of the oldefl life, their fum will be the value of an annuity on the whole duration of the joint lives.
The values of annuities on the joint continuance of three, or any other number of lives, are found in a dimilar manner. The leveral fractions expreffing the refpective probabilities of their continuing one, two, three, four, \&c. years, being multiplied into one another, and alfo into il. difcounted as before ; and the fum of the products ariling from thefe multiplications continued to one, two, three, four, \&c. years, or to the extremity of the oldelt of the lives, will be the values of the annuity for one, two, three, four, \&c. years, or for the whole duration of the joint lives.

With refpect to annuities on the longef of any number of lives, the reafoning is not fo timple. The following explanation, however, of the method of determining their values, when only two lives are concerned, will be eafily undertood. Suppofe the ages of the two perfons to be 50 and 60 ; and for the fake of more perficuity, let $a, b, c, d$, $c$, \&c. be the number of perfons living in the table at the age of the younger life, at the begiming of the firft, fecond, third, \&c. Jears: and, in like manner, let $m, n, o, p, \& c$. Ke the number of perfons living in the table at the age of Vol. XX.
the older life. From what has been already oblerved, the chances of the younger life's furviving the firk, fecord, third, \&ec. year, will be $\frac{b}{a}, \frac{c}{a}, \frac{d}{a}, \& c_{0}$; and the chances of the older life's furviving thofe years refpectively will be $\frac{n}{m},{ }_{m}^{0}, \frac{p}{m}$, \&c. ; and the chances that they will not furvive the firft, fecond, third, \&cc. years, will be $s-\frac{b}{a}$, $\overline{1-\frac{c}{a}}, \overline{1-\frac{d}{a}}$, \&c. and $\overline{1-\frac{n}{m}}, \overline{1-\frac{o}{m}}, \overline{8-\frac{p}{m}}$, \&c. The chance, therefore, that both will die in the fird year will be $\overline{1-\frac{b}{a}} \times \overline{\mathrm{i}-\frac{n}{m}}=1-\frac{b}{a}-\frac{n}{m}+\frac{b \pi}{a m}$ that both will die in the fecond year $\overline{1-\frac{6}{a}} \times \overline{1-\frac{8}{5}}$ $=1-\frac{c}{a}-\frac{0}{m}+\frac{c o}{a m}$, and fo on for the other years. If each of thefe expreffions be fubtrafted from unity, we fhall have $\frac{b}{a}+\frac{n}{m}-\frac{b n}{a m}$ for the chance that they will noi both die, that is, that one or other of them will live to the end of the firft year, $\frac{c}{a}+\frac{o}{m}-\frac{o c}{a m}$ for the chance that they will not both die in two years, \&cc. By continuing thefe expreffions for as many years as are equal to the difference between the age of the younger life and of the oldeit life in the table, and multiplying them refpectively into $1 \%$ difcounted for one, two, three, $\& \mathrm{kc}$. years, we fhall have the whole value of an annuity on the longeft of the two lives. Let $\frac{1}{r}, \frac{1}{r^{2}}, \frac{1}{r}$, be $1 \%$ difcounted for one, two, three, \&c. years, and the feries exprefing the annuity will be $\frac{b}{a r}+$ $\frac{c}{a r^{2}}+\frac{d}{a r^{3}}+8 c \ldots .+\frac{n}{m r}+\frac{o}{m r^{2}}+\frac{p}{m r^{3}}+$ \&c. $-\frac{b n}{a m r}-\frac{c o}{a m r^{2}}-\frac{d p}{a m r^{3}}-\& c$. But the firit of thefe feries is the value of an annuity of $I l$. on the younger life, the fecond the value of the like annuity on the older life, and the third the value of the fame on the two joint lives: whence it follows, that if "from the fum of the values of the two fingle lives we fubtract the value of the two joint lives, the remainder will be the value of an annuity on the longeft of the two lives."
Example,-Let the ages of the two lives be 20 and 30 , and let interelt be reckoned at 4 l. per cent. The value by 'Table VI. of a life of 20 is 16.033 , and of a life of 30 is 14.781. The fum of thefe two values is 30.814 . The value of the joint lives by Table IX. is II.873; and this value fubtracted from 30.814 , leaves 18.941 for the value of an annuity on the longeft of the two lives.

This account leads to an eafy explanation of the method of finding the value of reverfionary life-annuities mentioned at the beginning of this article, that is, of life-annuities which are to commence on the furvivorfhip of one or more lives beyond others. See Reversions and Survitorsimits.
Problems I. - To approximate to the value of a given life according to any given table of obfervations.
Solution.-Take the difference between twice the expecta.
tion of the given life by the given table, and 86 ; and the value deduced from M. De Moivre's Table of the valucs of lives correfponding to that difference, provided it is not lefs than ten, will be the value of the life.
E.annele - The expectation of a life aged 15 is, by the Northampton 'Table of Obfervations, (or Table IV, under the article Expectation,) $36 \frac{1}{2}$. The difierence between twice this number and 86 is 13 . And the value correfponding to the age of 13 in M. De Moivre's 'Table of the values of lives (or Table IV.) is i6.604, reckoning interelt at 4 per cent.; and this is nearly the value of a life aged 15 , by the Northampton Table.

Scholium.-It mult be remembered that this rule is only an approximation, and fhould not be uicd except when recourfo cannot be had to tables giving the values of lives agreeable to given obfervations. The method of calculating fuch tables has been before particularly explained.

Problem II.-To determine the value of any two joint lives by M. De Moivre's hypothefis, or on the fuppolition of an equal decrement of life, through all its 1tages.
Solution. - This value is expreffed by the feries $\frac{\overline{n-1} \cdot \overline{m-1}}{n m r}$ $+\frac{\overline{n-2} \cdot \overline{m-2}}{n m r^{2}}+\frac{\overline{n-3} \cdot \overline{m-3}}{n m r^{3}}+\ldots(m)$ fuppofing $i z$ to be the complement of the younger, and $m$ the complement of the older life, which Mr. Simpfon has given in his Treatife on Annuities, and Mr. Morgan in his edition of Dr. Price's Treatife on Reverfionary Payments, note L, appendix, has demonftrated to be $=V-\frac{V+1}{n} \times$ $\overline{n-m-2 \mathrm{~V}-\mathrm{I}} \times \frac{\mathrm{P}}{m}+2 \mathrm{~V}$, V being the perpetuity, and P the value of an annuity certain for $m$ years. From this theorem may be deduced the following rule. Referve the difference between the complement of the youngef life and the complement of the oldeft life increafed by unity and by twice the perpetuity. Multiply this difference by the value of an annuity certain for a time equal to the complement of the oldeft life; and by this complement divide the product, referving the quotient. From twise the perpetuity fubtract the referved quotient, and multiply the remainder by the perpetuity increafed by unity. This laft product divided by the complement of the youngeft life, and then fubtracted from the perpetuity, will be the required value. Example. - Let the joint lives be 10 and 15 . Their complements by M. De Moivre's hypothelis are 76 and 7 I . The complement of the oldett life, increafed by unity and twice the perpetuity, (or twice 25 , reckoning interelt at 4 per cent.) is 122 ; which leffened by 76 , the complement of the youngeft life, leaves 46 for the referved difference. This difference multiplied by $23 \cdot 456$, (the value of an annuity certain for 71 years, by Table III. Annuities.) and the product divided by 71, (the complement of the oldeft life,) gives 15.196 , the quotiont to be referved; which fubtracted from double the perpetuity (or from 50), and the remainder (or 34.803 ) multiplied by the perpetuity iucreafed by unity (or by 26 ), gives 904.878 ; which divided by $7^{6}$ (the complement of the youngent life), and the quotient fubtracted from the perpetuity, we bave 13.003 for the value of two joint lives aged to to 15 , by M. Ne Moivre's hypothefis.

By this rule, Table V. in the following. collection of tables, was computed by Dr. Price. (See his Treatife on Reverlioniary Payments.) To this he was induced by the coulideration, that there was no table extant at that time of
the values of joint lives, except Mr. Simpfon's for Londow, ('Table III. in this collection,) which being founded on the llate of human mortality in one of the worlt of all fituations, or among the inhabitants of London taken in the grofs, was by no means fitted for general ufe. The truth alfo is, as lath been before obferved, that ncither do the tables formed from M. De Moivre's hypothefis give the values of fingle and joint lives with the exactnefs neceffary to adapt them properly to general ufe; nor can it indeed be ever neceffary to have recourfe to them, as we are now poffefied of thofe tables, deduced from real obfervations, which are inferted at the end of this collection.

Problem III.-To determine the value of an annuity on a given life for any number of years.

Solution,-Find the value of a life as many years older than the given life as are equal to the term for which the annuity is propofed. Multiply this value by 11. payable at the end of this term, and alfo by the probability that the life will continue fo long. Subtract the product from the prefent value of the life; and the remainder multiplied by the annuity will be the anfwer.

Exainple.-Let the annuity be tol ., the rate of intereft 4l. per cont., the age of the given life 30 years, and the term propofed ${ }_{1} 5$ years. The value of a life aged 45 (or 15 years older than the given life) appears by Table VI. to be 12.283 . The value of Il. payable at the end of 15 years (by Table II. under Annuities) is.5553, and the probability that the life will exilt fo long is (by
Table III. under the article Expectation) $\frac{3243}{43^{8} 5^{\circ}}$. Thefe three quantities multiplied into each other are equal to 5.051 , which being fubtracted from 14.78 B , (the prefent value of the given life by Table VI.) we have 9.730 ; and this remainder multiplied into 10 (the annuity) gives $97.30 \%$ for the value required.
Problen IV.-To approximate to the value of an annuity for three joint lives, A, B, and C.

Solution.-Let $\mathbf{A}$ be the youngef, and $C$ the oldeft of the three propofed lives. Take the value of the two joint lives $B$ and $C$, and find the age of a fingle life $D$ of the fame value. Then find the value of the joint lives $A$ and $D$, which will be the anfwer.
E.rample-Let the three given ages be 20,30 , and 60 . The value, reckoning interelt at 4 per cent., of the two oldelt joint lives B and C (by Table XIII.) is 7.802 , anfwering nearly to a fingle life D of 65 years (by Table VI:); and the value of the joint lives A and D (by Table XVI.) is 6.986 , which will be the value required.

This rule was firf given by Mr. Simpion in his Select Exercifes; and the following comparifon, taken from Dr . Price's Treatife on Reverfionary Payments, will fhew its correctnefs.

Problen V. - To find the value of an annuity on the Iongeft of three lives, $A, B$, and $C$.

Solution.-Let $a, b, c, d$, \&c. be the number of perions living in the table at the age of $A$, at the beginning of the firlt, fecond, third, \&c. years; $m, n, a, p, \& c$. the fame numbers at the age of B ; and $s, t, u$, $w$, , Sc. the like numbers at the age of C , the older of the three lives. By reafoning as in the cafe of the longett of two lives, the probability that $A, B$, and $C$, will die in one, two, three, Sc. years, will be $\overline{1-\frac{b}{a}} \times \overline{1-\frac{n}{n}} \times \overline{1-\frac{t}{s}} \ldots \overline{1-\frac{c}{a}}$ $\times \overline{\mathrm{I}-\frac{q}{m}} \times \overline{\mathrm{I}-\frac{u}{s}} \ldots \overline{\mathrm{I}-\frac{d}{a}} \times \overline{\mathrm{I}-\frac{p}{m}} \times \overline{\mathrm{I}-\frac{w}{s}}$ scc. $=t-\frac{b}{a}-\frac{a t}{m}-\frac{t}{\delta}+\frac{b_{n}}{a_{n}}+\frac{b t}{a_{\delta}}+\frac{n t}{m_{s}}-\frac{b n t}{a m s}$ $\ldots \mathrm{I}-\frac{c}{a}-\frac{o}{m}-\frac{v}{s}+\frac{c \theta}{a m}+\frac{c u}{a s}+\frac{o u}{m s}+\frac{c 0 u}{a m s}$ .... \&c. which being feverally fubtracted from unity, the refpective remaindors, or $\frac{b}{a}+\frac{n}{m}+\frac{t}{s}-\frac{b_{n}}{a m}-\frac{b t}{a s}-$ $\frac{n t}{m s}+\frac{b n t}{a m s} \cdots \frac{c}{a}+\frac{o}{m}+\frac{u}{s}-\frac{c o}{a m}-\frac{c u}{a s}-\frac{0 u}{m s}+$ $\frac{00 u}{a \mathrm{~ms}} \ldots .$. . \&c. will exprefs the probability that one or other of them will live to the end of one, two, three, \&c. years. Thefe fractions being multiplied into $\frac{1}{r}, \frac{1}{r^{2}}$, \&c. we have $\frac{b}{a r}+\frac{c}{a r^{3}}+\frac{d}{a r^{3}}$, sc. $+\frac{n}{m r}+\frac{a}{m r^{2}}+\frac{p}{m r^{3}}+$ $\& c \ldots . .+\frac{t}{s r}+\frac{u}{s r^{2}}+\frac{\varepsilon}{s r^{3}}, \& c \ldots \ldots-\frac{b n}{a m r}-$ $\overline{c o}-\frac{d \rho}{a m r r^{2}}, \& c_{0}-\frac{b t}{a s r}-\frac{c \psi}{a s r^{2}}-\frac{d w}{a s r^{2}}, \& c_{0}-\frac{n t}{m s r}$ $-\frac{o u}{m s r^{2}}-\frac{p w}{m s r^{3}}, \delta c .+\frac{b n t}{a m s r}+\frac{c o u}{a m s r^{2}}+\frac{d p w}{a m s r^{3}}, \& c$. for the value required. Therefore the value of an annuity on the longeft of the three lives, $\mathrm{A}, \mathrm{B}$, and C , is equal to the "fum of each pair of the two joint lives, fubtracted from the fum of the three fingle lives, added to the value of the three joint lives."

Example.-Let the ages of $\mathrm{A}, \mathrm{B}$, and C , be 20,30 , and 60 , refpectively, and intereft of money $4 l$. per cent. By Table IX. the value of the two joint lives $A$ and $B$ is 11.873 , of $B$ and $C 7.802$, and by Table XIII. of $A$ and $C 7.995$, The fum of thefe three values is 27.67 - By TableVI. the value of the fingle life of $A$ is 16.033 , of $B 14.78 \mathrm{I}$, of C 9.039 . By Problem V. the value of the three joint lives is 6.986. Thefe four values added together are equal to 46.839 ; from which deducting 27.67 , the value of each pair of joint lives found above, we have $19.16 g$ for the value fought.

Prollom VI.-To find the value of an annuity granted upon three lives, $A, B$, and $C$, on condition of its ceafing as foon as any two of them become extinct.

Solution. - This annuity mut be paid during the three joint lives, which may be exprefled by $A \operatorname{BC} ;$ allo,
during the two joint lives of $A$ and $B$, after $C$; during the two joint lives of $A$ and $C$, after $B$; and during the ewo joint lives of B and C , after A . "Thede latk three values are refpectively equal to $\bar{A} B-\Lambda \overline{B C}, A C-\bar{A} \bar{C}$, and $B C-A B C$. (Sec article Revehsions.) Confequently the whole value will be $A B+A C+B C-2 A B C$; therefore find the value of each pair of joint lives, viz. of $A$ and $B$, of $\mathbf{A}$ and $\mathbf{C}$, and of $B$ and $C$. 'Ihen from the fum of thefe three values let twice the value of the three joint lives, $A, B$, and $\mathbf{C}$, be deducted, and the renainder will be the anfwer.

Example-Let the ages of $\mathrm{A}, \mathrm{B}$, and C , refpectively be 20,30 , and 60 . By 'l'ables 1X. and XIII. the value of the joint lives,

$$
\left.\begin{array}{l}
\mathrm{A}, \mathrm{~B} \\
\mathrm{~A}, \mathrm{C} \\
\mathrm{~B}, \mathrm{C}
\end{array}\right\} \text { will be }\left\{\begin{array}{l}
11.873 \\
7.097 \\
7.802
\end{array}\right.
$$

the fum of which three numbers is 27.670 . Moreover, the value of the three joint lives, $A, B$, and $C$, by problem $V$. is 6.986 ; therefore $13.6,8$ is the valuc required.

See on this fubject Simpfon's Doctrine of Life Annuities, Dr. Price's Treatife on Reverfionary Payments, Mr. Baron Maferes on Life Anmuities, and Mr. Morgan on the Doctrine of Life Annuities and Affurances.

Lite-Annuities, payable balf-yearly. Thefe are more valuable than life-aunuitics payable yearly, on the two following accounts. Firft, the annuitant in this cafe reccives one-half of every payment half a year fooner; and, ficondly, he has the chance of receiving one half-year's payment more than if he had been paid jearly. Mr. Simpfon, in his Select Exercifes, p. 283, obferves, that the value of thefe two advantages put together (let the rate of interef and the number of lives on which the annuity depends be what they will) will always amount to $\frac{1}{7}$ of a ycar's purchafe; and that if the payments are to be made quartily, thefe advantages will be always worth $\frac{3}{7}$ of a year's purchafe. But Dr. Price, in an effay in the Philofophical Tranfactions, vol. lxvi. part i. P. 109. has flated the differcnces of value between life-annuities, as they are made payable yearly, half-yearly, or quartelly, with more precifion; and from his inveltigations it appears, that a fifth of a year's purchafe is generally an addition more than fufficient to the yearly value of an annuity, in order to obtain its value, payable half-yearly; and thrie-fenths of a year's purchafe, in order to obtain its value, payable quarterly.

Dr. Price has given the following hort and eafy theorems for finding in all cafes thefe differences of value.

Let $r$ be (not $1 /$. with its intereft, but mercly) the intereft of $1 /$. for a year, $n$ the conplement of a given life; $y, b, q, m$, the values refpectively of an annuity certain for $n$ years, payable yearly, half.yearly, quarterly, or momently (fee the article Ansuities); P the perpetuity; Y the prefent value of an annuity on a life, whofe complement is $n$, payable yearly; H the value of the fame annuity payable half-yearly; $Q$ the value of the fame annuity parable quarterly; and $M$ its value payable momently.

$$
\text { Then, } \begin{aligned}
\mathrm{Y} & =\mathrm{P}-\frac{1+r}{r n} \times y \\
\mathrm{H} & =\mathrm{P}-\frac{\mathrm{I}+\frac{r}{2}}{n r} \times \% \\
\mathrm{Q} & =\mathrm{P}-\frac{\mathrm{I}}{\mathrm{I}} \mathrm{r} \frac{r}{4} \times \eta \\
\mathrm{M} & =\mathrm{P}-\frac{n}{n r}
\end{aligned}
$$

Example. - Let the life fuppofed be of the age of 36 . The complement of fuch a life is (by what has been already faid) 50 , according to M. De Moivre's hypothetis; therefore, $n$ will be 50 . Let the rate of intereit be 4 per cent., or $r=0.04, \mathrm{P}=25, \mathrm{Y}=21.482$ (fee Table III. As:suities), $b=21.549$ (by the theorems given under Asxuities), $q=21.5 S_{-}$, by the fame theorems, and $m=$ 21.616. Therefore,

$$
\begin{aligned}
& \mathrm{Y}=25-\frac{1.04}{50 \times 0.04} \times 21.482=13.829 \\
& \mathrm{H}=25-\frac{1.02}{50 \times 0.04} \times 21.949=14.010 \\
& \mathrm{Q}=25-\frac{1.01}{50 \times 0.04} \times 21.582=14.101 \\
& \mathrm{M}=25-\frac{21 . \frac{616}{50 \times .04}}{5}=14.191
\end{aligned}
$$

Thefe theorems, though founded on the hypothefis of an equal decrement of life, give the differences between the

## LIF

rearly, half-yearly, and quarterly values, almof exactly the fame, whether thofe vaiues be deduced from real obfervations or from this hypothefis.

For determining the differences between the valucs of annuities on two joint lives, when payable half-yearly, quarterly, or momently, Mr. Morgan, in the 6th edition of Dr. Price's Treatife on Reverfionary Payments, (note L, appendix,) has given the following theorems. Let $h, q, m$, denote the fame quantities as above for $t$ years. Let $n$ be the complement of the younger, and $t$ the complement of the older life. Let $r$ alfo be the intereft of $1 /$. for a year, and V the perpetuity: then will the value of the annuity be
$\mathrm{V}-\frac{\mathrm{V}+\frac{1}{2}}{n} \times \overline{\overline{n-t-\frac{1}{2}-2} \overline{\mathrm{~V}} \times \frac{b}{t}+2 \mathrm{~V}}$, or $\mathrm{V}-$
$\frac{\mathrm{V}+\frac{x}{4}}{n} \times \overline{\overline{n-t-\frac{1}{4}-2 \mathrm{~V}} \times \frac{q}{t}+2 \mathrm{~V}}$, or $\mathrm{V}-\frac{\mathrm{V}}{n}$
$\times \overline{n-t-2 V} \times \frac{m}{t}+\varepsilon \mathrm{V}$, according as it is payable half-yearly, quarterly, or momently.

Thus, if the ages of the two lives be 20 and 36 years, the value of the annuity at $4 \%$ per cent., when payable yearly, may be found by the theorem in the preceding article to be equal to 11.227 ; and its value, when payable either half-yearly, quarterly, or momently, may be found by thefe theorems to be either $11.427,11.565$, or 1 I .629. If the ages of both lives be 36 , thefe values refpectively will be $10.394,10.600,10.703$, and 10.808 . It may be obferved, that the differences between the values of two joint lives are always greater than the differences between the values of the fingle lives, when payable at fhorter intervals than a year; and therefore, that the addition, in this cafe, to be made to the value of an annuity on the longett of two lives will be lefs than the addition to be made either to the joint or fingle lives.

Lire-Annuities fecured by land, differ from other life-annuities only in the fingle circumftance, that the annuitant, whenever he dies, is entitled to a payment for the time which has lapfed between the payment lait due, and the moment of his death; whereas other annuities fuppofe nothing due for this time. In order to obtain the value of fuch an annuity, $\frac{y}{2 n}$ mult be added to the expreffion in the firf theorem, if it is payable yearly ; $\frac{b}{4 n}$ mutt be added to the expreffion in the fecond theorem, if it is payable half-yearly; and $\frac{q}{8 n}$ muft be added to the expreffion in the third theorem, if the annuity is payable quarterly. For fince $\frac{1}{n}$ is the probability that a life, whofe complement is $n$, fails in any year of its duration, and it is an equal chance whether more or lefs than balf the yearly, half-yearly, or quarterly payment is due at the death of the aniuitant, it frllows that the additional value of the annuity will be either $\frac{1}{n} \times \frac{y}{2}$, or $\frac{1}{n} \times \frac{1}{2}$ $\times \frac{b}{2}$, or $\frac{x}{n} \times \frac{1}{2} \times \frac{q}{4}$, according as the fame is payable either yearly, half-yearly, or quarterly. See Dr. Price's Effay; before quoted.'

The value, therefore, in the laft example, of an annuity payable yearly on a life aged 36 , being 13.829 ; its value, . Vol. XX.
if fecured by land, or to be enjoyed to the lalt moment of life, will be $13.829+\frac{21.482}{100}=14.043$; if fecured by land, and payable half-yearly, its value will be x4.0ro + $\frac{21.549}{290}=14.117$; if fecured by land, and payable quarterly, its value will be $14.101+\frac{21.582}{400}=14.155$.

Lies-Annuities, in the contemplation of Lazu, are in fome cafes fold and purchafed in an improvident manner, and with great privacy; and therefore, in order to throw fome check on tranfactions of this kind, the ftatute 17 Geo . III. c. 26 . has directed, that upon the fale of any life-annuity of more than the value of 101 . per annum, (unlefs on a fufficient pledge of lands in fee-fimple, or flock in the public funds; ) the true confideration, which fhall be in money only, fhall be fet forth and defcribed in the fecurity itfelf; and a memorial of the date of the fecurity, of the names of the parties, ceflui que trufts, ceflui que vies, and witneffes, and of the confideration money, fhall, within 21 days after its execution. be inrolled in the court of chancery, elfe the fecurity fhall be null and void; and, in cafe of collufive practices refpecting the confideration, the court, in which any action is brought, or judgment obtained upon fuch collufive fecurity, may order the fame to be annulled; and the judgment, if any, to be vacated; and alfo all contracts for the purchafe of annuities from infants fhall remain utterly void, and be incapable of confirmation after fuch infants arrive to the age of maturity. By 29 Geo. III. c. 4I. § 27 , and other acts that refpect life-annuities, oath of an annuitant's life may be made before a juftice of the peace, who fhall give a certificate thereof, without fee or ftamp-duty, in order to entitle fuch perfon to receive his annuity.

## life-Boat. See Boat.

## Lipe, Complement of. See Complement.

Life Efates, in Lazu, are fuch eftates of freehold as are only for life. (See Estate.) Of thefe fome are conventional, and others merely $\operatorname{leg} a l$. Eftates for life of the firft kind, exprefsly created by deed or grant, are where a leafe is made of lands or tenements to a man to hold for the term of his own life, or that of any other perfon, or for more lives than one; in any of which cafes he is flyled tenant for life; only when he holds the eftate by the life of another, he is ufually called tenant pur autre vie. Thefe eftates for life are like inheritances, of a feodal nature; and for fome time were the higheft effate that any man could have in a feud, which was not in its original hereditary. They are given or conferred by the fame feodal rights and folemaities, the fame inveltiture or livery of feifin, as fees thernfelves are; and they are held by fealty, if demanded, and fuch conventional rents and fervices, as the lord or leffor, and his tenant or leffee, have agreed on. Eltates for life may be created, not only by exprefs words, but alfo by a general grant, without defining or limiting any fpecific eltate. As if we grant to A.B. the manor of Dale, this makes him tenant for life. (Co, Litt. 4I.) Such eflates for life will, generally fpeaking, endure as long as the life for which they are granted ; but there are fome eftates for life, which may de. termine upon future contingencies, before the life for which they are created expires; as an eftate granted to a woman during her widow-hood, or to a man till he be promoted to a benefice. Thefe, while they fubfiit, are reckoned eftates for life; becaufe the time for which they will endure being uncertain, they may by poffibility laft for life, if the contingencies upon which they determine do not fooner happen. 5.A

The

The insidents to an eftate for life are principally the folJewing ; and they are applicable not only to that fpecies of tenants for life which are exprefsly created by, deed, but alfo to thofe which are created by act or operation of law. i. Every tenant for life, unlefs reftrained by covenant or agreement, may of common right take upon the land demifed to him reafonable eftovers, or botes. (Co. Litt. 43.) But he is not permitted to cut down timber or do other wafte upon the premifes. (Id. 53.) 2. Tenant for life, or his reprefentatives, flall nor be prejudiced by any fudden determination of his eftate, becaufe fuch a determination is contingent and uneertain. (Ibid. 55.) The advantages alfo of emblements are particularly extended to the parochial clergy by Itat. 28 Hen. VIII. c. If. 3. 'Another incident to ellates for life relates to the under-tenants, or leffees. For they have the fame, nay greater indulgences than their leffors, the original tenants for life.

The fecond eftate for life is of the legal kind, as contradiftinguifhed from concentional; viz. that of tenant " in tail after poffibility of iffue extinct." This happens where ne is tenant in fpecial tail, and a perfon, from whofe body the iffue was to fpring, dies without iffue; or, having left ifue, that iffue becomes extinet; in either of thefe cafes, the furviving tenant in feceial tail becomes tenant in tail after poffibility of iffue extinct. This eftate mult be created by the act of God: that is, by the death of that perfon out of whofe body the iffue was to fpring; for no limitation, conveyance, or other human act can make it. A polibility of iflue is always fuppofed to exit in law, unlefs extinguifled by the death of the parties; even though the donees be each of them 100 years old. (Litt. § $3 \dot{q}^{\circ}$. Co. Litt. 28.) This eftate is of an amphibious nature, parraking partly of an eftate-tail, and partly of an eftate for life. In truth, the tenant is only tenant for life, but with many of the privileges of a tenant in tail, as, not to be punimable for wafte, \&c. (Co. Litt. 27.) ; or, he is tenant in tail, with many of the reltrictions of a tenant for life; as, to forfeit his eftate if he alienes it in fee-fimple (Ibid. 28.); whereas fuch alienation by tenant in tail, though voidable by the iffue, is no forfeiture of the eftate to the reverfioner; who is not concerned in interelt, till all poffibility of ifue be extinct. But, in general, the law looks uoon this eflate as equivalent to an eftate for life only; and, as fuch, will permit this tenant to exchange his eltate with a tenant for life: which exchange can only be made of eftates that are equal in their nature. Life-sverlafing, åname by which the ilicbryfum, or onaphaliun of botanical writers, is fometimes called. See Cüweed.

Life Guards. See Guards.
Life Preferver, againft drowning. Many different artio cles under this denomination have been made, particulariy within the fe few years, by Collins, Spencer, Daniels, and others. But we believe they have all been copied, in a greater or lefs degree, from an apparatus conftructed by John Bentley, efq. about the year 1797. It is however remarkable, that although he exhibited it in public feveral times, lome very important parts of it feem to have efcaped their notice, or at lealt their application of them to their own purpofes. The following is his account of it.

The human body in moft inftances is of the fame fpecific gravity as water ; therefore, any fubftance which is lighter than water, being attached to the body, mult caufe it to foat. The fituation beft adapted for fixing it is round the
body, immediately under the arms; and as it is defirable to be able to keep the head, neck, fhoilders, and arms above water without any exertion, the article ufed mult difplace a bulk of water equal in weight to thofe parts. The next thing to be attended to, is to enable a perfon who cannot fwim to make progrefs through the water. The hands and fect are too narrow to accomplifh this without a knowledge of the art of fwimming, therefore the fingers and feet mult be artificially zwebbed. Thus the whole apparatus, which he calls a nautilus, confifts of thrce diftinct parts, and are to be thus conitructed.

The buoyant is made of copper, in the form of a tube, to fit the round of the body, about fix inches diameter, the feam brazed with hard folder. It fhould be made in three lengths, the ends quite flat, to fit each other exaclly, fo that, when put together, they form a ring or belt. This is in cafe of accident happening to one part by leaking, that it may not extend to the other two, which will be fufficient to prevent finking. Each of thefe parts is fewed up in baize, with three ftrong tapes near the end of each piece, by which all of them are fecurely tied together. A flexible pipe, of the thicknefs of a quill, is inferted in each piece, from the upper fide to the bottom, fo that if any leakage happens, the water is readily drawn out by the mouth and difcharged. The buoyant, thus prepared, mulk be fecurely tied with flrong tapes, croffed round and over the fhoulders, to prevent it getting down. It cannot get over the arms. When it is thus fixed, the body will, by its own gravity, be erect in the water, with the feet downwards, and will always retain this pofition unlefs force is applied to alter it, and which it will again recover when the force ceafes to act. The fecond part, which is for the hands, is a pair of ciled filk gloves, which, after being made in the ufual way, the fingers are opened to their full extent breadthways, and a piece of the fame material fewed over them on the under fide. Tapes are fewed at the top to tie them round the writ.

The third part, being for the feet, is made thus: take a piece of half-inch wainfoot or mahogany, II inches long, and so inches wide. Cut it longitudinally into three pieces, two of them $3^{\frac{3}{4}}$ inches broad, and the other $2 \frac{1}{2}$ inches. Fatten them well together with two pair of brafs hinges, and rule joints to fall and rife like a two-leaved table, the narrow piece being in the middle. On the under-fide of the middlepiece, in the centre, a wooden turn buckle muft be ferewed, to prevent the fidd-picces from falling down, when walking to or from the water. Two wonden fops are fo.fixed upon this piece as to prevent the fides, when down, coming to a right angle with che middre-piece, that the riling and falling nay be duly performed with the action of the feet. To the upper fide of the middle-pieces. a common leather fhoc, (to fit the perfon) mult be falfened on with two. fcrews through the fole, and near eacle end of: this middle-piece two fmall holes are made with a centre bit, through which good tapes are paffed, to tie round the inltep and over the foot. A pair of theief mult of courfe be provided, and a perfon thus equipped; being perfectly bhoyant in water, and web-foeted and web-fingered, will be able to outfwim any other perfon, and may exitt in the water as long as cold and hunger will permit.

By increafing the dinzenfion of the buoyants a proportionate quantity of provifions, or any other article, may be carried. The inventor has wrote a letter, and otherwife amufed himfelf on the fea; with this apparatus, and believes he could crofs from Daver to Calais in perfect fafety. It is very convenient for croffing deep rivers, where there are neither boats nor bridges.. It is procured at little expence, very
portable,

LIFFAMAT'ULA, in Geograpby, an ifland in the Eaft Indian fea, 25 miles long and fix broad. S. lat. $2^{\circ}$. E. long. $126^{\circ} 1^{\prime \prime}$ 。

LIFFEY, a river of Ireland, which rifes in the northweltern mountains of the county of Wicklow, and winding through the county of Kildare, it pafies through the city of Dublin, and flows into Dublin bay: It derives its chiefimportance from the greatnefs of the city fituated on its banks.

LIFFORD, the county-town of the county of Donegal, Ireland, a very fmall place, and at one extremity of that large county, but fixed upen to accommodate the judges and gentlemen of the bar: one mile W. from Strabane, and io1 N.W. by N. from Dublin.

LIFFRE, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diftrict of Rennes; 9 miles N.E. of Rennes. The place contains 2096, and the canton 8372 inhabitants, on a territory of 205 kiliometres, in 7 communes.

LIFTING-Pieces, in a clock, are thofe parts which lift up and unlock the detents in the clock part.

LIFTS, in a Slip, ropes belonging to the yard-arms of all yards. Their ule is to ftop the yard-arms, i. e. to make the end of the yards lang higher or lower, as occafion ferves. The top-fail lifts ferve as theets for the top-gallant yards, as well as for lifts to the top-fail yards. The haling of thefe ropes is called topping tbe lifts: thus they fay, top a flarboard, or top a port, i. e. hale upon the ftarboard or larboard lift.

The lifts for the fprit-fail-yard are called fanding lifts.
LIGAMENT, in its general fenfe, denotes any thing that ties or binds one part to another.

In which fenfe the ancients applied the word to membranes, Skin, flefh, veins, and arteries; as being common ligaments.

Ligament, in its more proper fignification, denotes a white, tourh, folid, inflexible part, ferving to inclofe, and keep together the junctures of the body.

It has no confpicuous cavities, nor has it any fenfe, left it fhould fuffer on the moving of the bones. It is found very different, according to the different parts where it is ufed. It is harder than a membrane, yet fofter than a cartilage : its principal ufe is to gird and frengthen the junctures, to prevent the diflocation of the bones, and even to fadten them together, when they have no articulation. It alfo ferves as a covering to the tendons to feparate them from the mufcles, and to hold up the fufpended entrails, left their weight fhould throw them down. Such are the ligaments of the liver, the bladder, and matrix.

Ligaments are of different fubftances; fome hard, others fuft, membranous, nervous, and cartilaginous; as alfo of different figures and fituations: fome arife from bones, others from cartilages, and others from membranes.

LIGAMENTUM, in Anatomy, a ligament or part connecting orgars together, and limiting their refpective motions. In its moft proper fenfe it denotes the fibrous bodies by which the bones are united at their articulations (fee Joint ) ; but it is often applied to parts of an entirely different kind, as to the membranous folds which attach vanous organs in the chelt and abdomen.

Liganientuas Aunulare, is a name given to different fibrous organs abotit, the wrift and foot, which confine the tendons of the extenfor and flexor mufcles in their fituation. For an account of the annular ligament of the carpus, fee Extre-
urries, The annular ligament of the fore-arm, which confines the extenfor tendons, is defcribed in the articles Extensor communis digitorum, and Fiscia. The defcrip. tion of the annular ligaments of the cord will be found under Fascia.

Lighamentum Arteriofum, is the fibrous cord conneEting together the trunks of the pulmonary artery and the aorta, confilting of the remains of the canalis arteriofus of the fcetus. See Embryo.

Ligamentum Ciliare, in the eye, is the white union of the felerotica and choroid coats. Sce Eye.

LIGAN, in haw, denotes a wreck contifting of goods funk in the fea, but tied to a cork or buoy, in order to be found again. Over thefe, as well as flotfam and jetfam, the high-admiral hath jurifdiction, as they are in and upon the fea. 5 Rep. $x 06$.

LIGANI, in Geography, a town of Turkifh Armenia; 30 miles E. of Ifpira.

LIGARDES, a town of France, in the department of the Gers ; 7 miles N.E. of Condom.

LIGATURE, among Myfic Divines, fignifies a total fufpenfion of the fuperior faculties, or intellectual powers of the foul. They pretend, that when the foul is arrived at a perfect contemplation, fhe remains deprived of all her operations, and ceafes to act in order to be more ready and prepared to receive the impulfe and communications of divine grace. This' paffive ftate of thefe contemplative people they call their ligature.

Ligature is alfo ufed for a ftate of impotency, in refpect to venery, pretended to be caufed by fome charm, or witchcraft.

Kæmpfer tells of an uncommon kind of ligature, or knotting, in ufe among the people of Maffacar, Java, Malaya, Siam, \&xc. By this charm, or fpell, a man binds up a woman, and a woman a man, fo as to put it out of their power to have to do with any other perfon; the man being thereby rendered impotent to any other woman, and all other meas impotent with refpect to the woman.

Some of their philofophers pretend that this ligature may be effected by the fhutting of a lock, the drawing of a knot, or the fticking of a knife in the wall, at the point of time wherein the prieft is joining a couple together; and that a ligature, thus effected, may be diffolved, by the fpoufe's urining through a ring. This piece of fuperitition is faid to obtain alfo among the Chrittians of the Eaft.

The fame author tells us, that during the ceremony of marriage in Ruffia, he obferved an old fellow lurking behind the church-door, and mumbling over a ftring of words; and, at the fame time, cutting a long rod, which he held under his arm , into pieces; which, it feems, is a common practice at the marriages of great perfons, and done with defign to clude and counter-work any other perfon, that might poffibly be inducing the ligature.

The fecret of inducing a ligature is delivered by the fame author, as he was taught it on the fpot by one of their adepts; which, being a curiolity, we thall not fcruple to add in his

## L I G

own words ; not daring to make it Speak Englifh. "Pueilla amafium, vel conjux maritum ligaturus, abfterget a concubitus actu, priapum, indufio-ut feminis quantum poteft excipiet. Hoc probe convolutum fub limine domus fure in terram fepeliat. Ibi quamdiu fepultum reliquerit, tamdiu ejus hafta in nullius preterquam fui (fafcinantis) fervitium obediet, et prius ab hoe nexu non liberabitur quam ex claultro liminis liberctur ipfum linteum : vice verfa, vir lecti fociam ligaturus, menftruatum ab co linteum comburit ; ex cinexibus cum propria urina fubactis, efformato figuram priapi, vel, fi cineres icunculx fingendx non fufficiant, cofdem fubigito cum parte terre, quam recens perminxerit. Formatam iconem caute exficcato, ficcamque affervato loco ficco, ne humorem contrahat. Quamdiu fic fervaveris, omnes artus, dum ad fcopam focix collimaverint, momento contabefcent: ipfe vero dominus. Abrunum hunc fuum prius humectato, quamdiu fic manebit, taídiu fufpenfo nexu priapus ipfi parebit, quin \& alios quotquot focmina properantes admiferit."
M. Marfhal mentions another ridiculous form of ligature, which he received from a Bramin at Hindooltan: "If," fays he, "the little worm in the wood lukerara kara be cut into two, and the one part flirs, and the other not, if the flirring part be bruifed, and given with half a beetle to a man, and the other half to a woman, the charm will keep each from ever having to do with any other perfon." Phil. Tranf. No. 268.

Ligature, Lizaturz, in the Italian Mufic, fignifies a tying or binding together of notes.

Hence fyncopes are often called ligatures, becaufe they are made by the ligature of many notes. There is another fort of ligatures for breves, when there are many of thefe on different lines, or in different fpaces, to be fung to one fyllable.

To under民and this, it mult be obferved, that only breves are capable of this . fpecies of ligature, becaufe their figure admits of their being placed fo clofe together, as to feem one character only, though placed on different degres, unlefs there be occafion to place a femicircle either above or below them, to fhew that they are tied. This kind of ligature regards common time ouly. Breves again muft be confidered as fimple, as having a tail, and as being of different colours. Firit, if they be fimple $日$ and afcend, they contain their natural quantity, i.e. each two femi-breves, as in example A. But if they defcend, then each is equivalent to four femi-breves, if only two follow one another, as in B. If there are three or four following ones, the firft and laft contain each four femi-breves, and thofe in the middle but two, as in C.

Sccandly, if they have tails $t$, and the tail be turned inpwards the breves contain only one meafure, as well afcending as defcending. "See Ex D. But if it be marked downvards, the breve then contains its natural quantity. See Ex. E. This fpecies of ligature was invented only becaufe the minim, being round, could not be ufed in this manner. And the femicircle was not at that time in ufe.

It may be here remarked, that ordinarily the firlt breve ;atione of every ligature has a tail, and that ufually placed on .the left fide. Laltly, if they be of different colours, i. e. if the firt be white, or open in the midule, and the fecond black,
the firft contains a femi-breve, and the feeond a pointed mis. nim. Example F.

Thefe are the principal ligatures, befides which there are many others, for which fee Character. See alfo Lega. tura.

Ligatures, among Printers, are types confifting of two letters or characters joined together, as $A, \mathcal{E}^{\circ}, f, f, f$. The old editions of Greek authors are extremely full of ligatures; the ligatures of Stephens are, by much, the molt beautiful.

Some editions have been lately printed without any ligatures at all; and there was a defign to explode them quite out of printing. Had this fucceeded, the fineft ancient editions would, in time, have grown ufclefs; and the reading of old manufcripts would have been rendered almoft impracticable to the learned themfelves.

Ligature, in Surgery, is the only means to be depended upon for putting a permanent fop to all bleedings from arteries of confiderable fize. In ordinary cafes, the mouth of the bleeding veffel being expofed, is taken hold of with the tenaculum, or forceps, and tied. In fome inflances, the artery being only punctured, and not cut through, nor brought into view, the furgeon has firft to cut down to the wounded portion of the veffel, and then pafs a double ligature under it by means of an aneurifm-needle, or an cyeprobe. The latter inftrument, having fulfilled its office, is to be removed by dividing the double ligature with a pair of fciffors. One part of the ligature is then to be applied round the artery in a firm knot above the opening from which the blood iffues, and the other below it. In cafes of aneurifm, the ligature is introduced under the artery in a very fimilar way.

Whoever is acquainted with the hillory of furgery, mutt be fully fenfible of the immenfe advantage which the moderns have over the ancients in the familiar employment of ligatures for the floppage of hemorrhage. But, although many years have elapfed fince this important improvement in practice began, it was not till very lately that feveral moft interefting circumflances, relative to the ufe of the ligature, were brought to light. For this elucidation of a difficult, though highly momentous, fubject to the practical furgeon, we are indebted to the judgment, accuracy, and talents of Dr. J. F. D. Jones, whofe Treatife on Hemorrhage demands the earnelt attention of every enlightened practitioner. Before this work appeared, fcarcely any furgeon had a jult conception of the manner in which ligatures effected the fuppreffion of hemorrhage; nor were the principles on which they ought to be made and applied properly underflood. One of the firtt and moft material effects of a ligature applied to an artery, is to produce a diviition of the middle and internal coats of the veffel. This fact was communicated to Dr: Jones by Mr. Thomfon of Edinburgh, and is alleged to have been known to the celebrated M. Default of Paris. The inner coats of the artery, thus cut through by the preffure of the ligature, are in the fitteft fate for inflaming and effufing coagulable lymph, and, in fhort, for undergoing that procefs, by which the permanent clofure of the vefiel is to be accompanicd. Hence, ligatures fhould not be thick, irregular, and clumfy; but fmall-
ifh, firm, and round; and they fhould be applied with tightnefs, as it is of confequence that they divide the inner coats of the artery, and the fear of their cutting the veffel quite through is deftitute of foundation. Thefe, however, and numerous other particulars, having been explained in a previous part of this Cyclopadia, we mult avoid unneceffary repetition, by referring the reader to the article Hemor. riage.

Ligeance, Ligeantia, in Lazu, is the true and faithful obedience of a fubject to his fovereign; and is alfo applied to the dominion or territory of the liege lord : thus children are faid to be born in or out of the ligeance of the king, \&c. Stat. 25 Edw. IlI. See Alfegiance and Liege.

LIGHT, that fenfation occafioned in the mind by the view of luminous bodies; or that property in bodies, whereby they are fitted to excite thofe fenfations in us.

Ligist is alfo ufed to denote a certain action of the luminous body, on a medium between it and the eye; by means of which, fome fuppofe the one to act on the other. This they call fecondary, or derivative light: to dittinguifh it from that of luminous bodies, which is called primary, or innate.

Ariftotic explains the nature of light, by fuppofing fome bodies to be tranfparent, as air, water, ice, \&c. ; but fince, in the night-time, we do not fee any thing through thofe bodies, he lays, they are only tranfparent potentially; whereas, in the day, they become really and actually tranfparent: and fince it is light alone that can reduce that power into act, he defines light to be the act of a tranfparent body, confidered as fuch. He adds, that light is not fire, nor is it any thing bodily radiating from the luminous body, and tranfmitted through the tranfparent one; but the mere prefence of fire, or fome other luminous body, at the tranfparent one.

This is Ariftotle's doctrine of light, which his followers miftaking, have charged on him another, very different; making light and colours to be qualities of the luminous and coloured bodies themfelves, and in all refpects like thofe fenfations which they occafion in us: aduing, that things lucid, or coloured, could not produce any fenfation in us, unlefs they had fomething fimilar in themfelves, fince nibill dat quod in fe non babet.

But the fophifm is apparent ; for we find, that a needle, in pricking the flefh, gives us pain, which nobody ever imagined to exift in the needle. But that it is not necefflary there fhould be any fimilitude between the quality of the object, and the fenfation it produces, appears ittll more evident from a glafs prifm, which is found to exhibit blue, yellow, red, and other colours extremely vivid; and yet no body will fay there is any thing in the glafs prifms like to thofe fenfations.

The Cartefians have refined confiderably on this notion ; and own that light, as it exits in the luminous body, is nothing but a power or faculty of exciting in us a very clear and vivid fenfation; adding, that what is required to the perception of light, is, that we be fo formed, as to be capable of fuch fenfations; that in the hidden pores of tranfparent bodies, there be a certain fubtile matter, which, by reafon of its exceeding fmallnefs, may penetrate even glafs, and yet be ftrong enough to fhake certain capillaments at the bottom of the eye; and lafly, that this matter be impelled by the luminous body, fo as to move the organ of fight.

Primary light, therefore, they fay, confifts in a certain motion of the particles of the luminous body, whereby they are enabled to propel, every way, the materia fubtilis,
lodged in the pores of tranfparent bodies; and fecondary or derivative light, in a conatus to motion, or an inclination of that matter to recede from the centre of the luminous body in right lines.

Father Malcbranche explains the nature of light, from a fuppofed analogy bet:ween it and found.

Thus he fuppofes all the parts of a luminous body are in a rapid motion, which, by very quick pulfes, is coultantly comprefling the fubtile matter between the luminous body and the eye, and excites vibrations of preffion. As thefe vibrations are greater, the body appears more luminous; and as they are more quick, or more flow, the body is of this or that colour.

This hypothefis, how ingenious foever, is now defervedly difcarded, fince the great difcoveries made by fir Ifaac Newton on the nature of light. The prinary light they talk of, we now know, conifis.s wholly in a certain motion of the particles of the lucid body, whereby they do not propel any fictitious matter, fuppofed to be lodged in the hidden pores of tranfparent bodies; but throw off from the luminous body certain very fmall particles, which are emittedevery way with great force; and the fecondary or derivative light confilts not in a conatus, but a real motion of thefe particles, receding every way from the luminous body, in right lines, and that with an incredible velocity.

The moft dittinguilhing property of light is that by which it renders objects vifible by fome power, which transfers their exterior figure to the retina of the eye.
We obtain light from three diftinct fources, which will divide our fubject into three heads; namely, folar light, light of combuftion, and phofphorefcent light.

Very little was known of the nature and properties of light before the experimental refearches of Newton ; and it is remarkable that at this time fo little fhould hare been added to the labours of that acute philofopher. It is itrange, that after the evidence of his experiments there could have been two opinions refpecting the nature of light. Huygens fuppofed the phenomena of light to be caufed by anundulatory motion, excited in a fuppofed fubtile and elaftic medium, pervading all fpace : that thefe waves or pulfes are propagated, firft at the luminous body, fuch as the fun or a candle, and tranfmitted in a!l directions. The impreflion made by thefe waves upon the eye is the caufe of vifion. This doetrine has fince been taken up by Euler, who, with much zeal and mathematical labour, fupported it to his death. Newton, however, had given an hypothefis, fupported by clear and friking experiments; and at the fame time had pointed out infurmountable objections to the undulatory hypothefis, fo that the labour and great talents of Euler were exhaufted to little purpofe.

Sir Ifaac Newton argued, with great propriety, that the undulatory motion was inconliftent "ith the phenomena of light. The paffage of light would not be confined ta ftraight lines, but might, like found, be conveyed through crooked tubes, which is contrary to the fact.

Befides, if light conlifted in a mere preffion, or pulfe, it would be propagated to all diftances in the fame inftant of time; the contrary of which appears from the phenomena of the eclipfes of Jupiter's fateliites, which we thall prefently mention.

We fhall therefore, with Newton, confider light as a ma. terial agent, moving with an inmenfe velocity from the point where it is liberated. If its motion be in free fpace, it moves in Itraight lines in the form of radii, and would continue for ever in the fame direction, if not changed in its courfe by the attraction of other matter. Light, therefore, like electricity and caloric, appears in a high degree to be
repellent of itfelf, although it poffeftes attraction for ponderable matter. Indeed, it is to this great repulfion of the particles of light that we are to altribute its progreffive velocity, which, therefore, is as the force by which its particles are feparated.

The fmall extent of the limits of vifion upon the furface of our globe does not enable us to appreciate the velocity with which light moves.

Roemer, a Danifh philofopher, at length found the means of determining this point by the difference of time in the celipfes of Jupiter's fatellites, when the earth was on the fame, or on the contrary fide of the fun, with that planet. The immerlions of thefe fatellites, as the earth approaches towards Jupiter, are found to anticipate fomewhat on the true time, and to commence fooner; and again, as the carth retires from Jupiter, their emerfions, which alone in that cafe can be obferved, happen later and later, or lofe time ; deviating thus, very confiderably on either fide, from the truc time marked by the tables.

This was firlt obferved by M. Roemer, and fince by other altronomers; the reafon of which is not owing to any eccentricity; but apparently follows from this circumttance, that the light of the fun, reffected frgm the fatellites, has farther to travel, before it reaches the eye, in the one cafe than in the other, by a fpace equal to the diameter of the earth's smnual orbit.

The obiervation, whence this conclufion was deduced, were made at the obfervatory belonging to the R yal Academy of Sciences at Paris, from 1670 to 1675 : the principal fact was, that the firlt fatellite fometimes emerged exaetly at the times calculated by the tables, and fometimes not, infomuch that the greatelt variation was about fourteen minutes. The particular obfervation that was the moft triking, was the emerfion of this fatellite obferved at Paris, Nov. $9,157 \sigma$, ten minutes later than it had been obferved in the month of Augult, when the earth was much nearer to Jupiter. Hence Caffini and Roemer both concluded, that this circumftance depended on the diftance of Jupiter with refpect to the earth; and that in order to account for it, they mult fuppofe that the light was about fourteen minutes in croffing the earth's orbit.

But the conclufion was afterwards abandoned and attacked by Monfieur Calfini. M. Roemer's opinion found an able advocate in Dr. Halley; who removed Caffini's difficulty, and left M. Roemer's conctufion in its full force. In a momoir prefented to the academy in $1 z_{0}^{\circ}$, Monfieur Maraldi endeavoured to give a new force to Caffini's arguments; but Montieur Roemer's doctrine found a new defender in Mr. Pound. See Phil. Tranf. N' 136. Phil. Trauf. Abr. by Lowth, vol. i. p. 4o9, 422 . S'Grav. Phyf. Elem. N 2636, feq.

It has been fince found, that when the earth is between the fun and Jupiter, his fatellites are eclipfed about eight minutes fooner than they could be according to the tables, and that when the earth is nearly in the oppofite point of its orbit, thefe eclipfes happen about eight minutes later than the tables predict them. Hence it is undeniably certain, that the motion of light is not inflantaneous, funce it takes about $16 \frac{1}{2}$ (or $16^{\prime \prime} 10^{\circ}$ ) mivutes, of time to go through a fpace equal to the diameter of the carth's orbit, which is at dealt 190 millions of miles in length; and confequently the particles of light fly about 19 gig or 200000 miles every fecond of time, which is uear a million of miles fwifter than the motion of a camnon-ball. And as hight is a $6 \frac{1}{\frac{1}{2}}$ minutes in travelling acrofs the earth's orbit, it mult be $8^{\frac{1}{4}}$ (or $8^{\prime} 5^{\prime \prime}$ ) miinutes in comeng from the fun to us; therefore, if the fun were annihilated, we fhould fee lim for $8 \frac{1}{3}$ minutes after;
and if he were again created, he would be $\mathrm{s}_{\frac{1}{4}}\left(\right.$ or $8^{\prime} 5^{\prime \prime}$ ) mi* nutes old before we could fee him. In order to explain this progreflive motion of light, let A and B, Plate IX. Optics, fig. 1, be the earth in two different parts of its orbit, whofe difance from each other is 95 millions of miles, equal to the earth's diltance from the fun $S$.

It is plain, that if the motion of light were inftantaneous, the fatellite I would appear to enter into Jupiter's fhadow F F, at the fame moment of time to a fpectator in A , as to another in B. But it is now well known that the immerfion of the fatellite into the fhadow is feen $8 \frac{\pi}{2}$ (or $8^{\prime} 5^{\prime \prime}$ ) minutes fooner when the earth is at B , than when it is at A . As the earth moves from $D$ to $C$, through the fide $A B$ of its orbit, it is conftantly meeting the light of Jupiter's fatellites fooner, which eccafions an apparent acceleration of their ecliples; and as it moves through the other half H of its orbit, from C to D , it is receding from their light, which occafions an apparent retardation of their eclipfes, becaufe their light is then longer before it overtakes the earth. That thefe accelerations and retardations are not occafioned by any inequality arifing from the motions of the fatellites in eccentric orbits is plain, becaufe it affects them all alike, in whatever parts of their orbits they are eclipfed. Befides, they go often round their orbits every year, and their, motions are no way commenfurate to the earth's. Therefore a phenomenon not to be accounted for from the real motiors of the fatellites, but fo eafily deducible from the motion of the earth, and fo anfwerable to it, muft be allowed to refult from it. And this affords one very good proof of the earth's annual motion. See the fequel of this article.

We fhall here obferve, that the firtt perfon, who conceived the thought of meafuring the velocity of light was Galileo, who has given a particular defcription of his contrivance for this purpofe, in his Treatife on Mechanics, P. 39. He had two men with lights, one of whom was to obferve when the other uncovered his light, and to exhibit his own the moment that he perceived it: the experiment was tried, as may naturally be magined, without fuccefs, at the diftance of one mile; but the members of the academy Del Cimento refumed the experiment, and placed the obfervers, to as little purpofe, at the diftance of two miles. However, the method ufed by M. Roemer, already mentioncd, was the only one adequate to the difcovery of the velocity of light.

Our excellent aftronomer, Dr. Bradley, has found nearly the fame velocity of light, from his accurate obfervations, and moll ingenious theory, to account for fome apparenit motions in the fixed ttars. Phil. Tranf. N 406, or Abridg. vol. vi. p. 150. And for a fummary account of thefe obfervations, \&c. fec Earth and Star.

To underftand this, it mult be premifed, that the fixed ftars are luminous bodies, and at reft, with refpect to our planetary fyltem, from which they are vally remote. In this fyltem alfo the earth is confidered as one of the planets, and moving about the fun.

Suppofe the fun reprefented in S, (Plate IX. Optics, $\left.f_{2} g .2.\right)$ and that the circle ABCD reprefents the path of the earth, or the ecliptic. At the centre S fuppofe a perpendicular S P raifed to the plane of the ecliptic, and that this perpendicular paffes through any fixed Itar. If a fpectator were placed in S , he would fee the ftar in the fame perpendicular; but if the fpectator paffes over the circle A BCD, the diameter of which is fuppofed to bear a fenfible though frmall propertion to the dittance of the ftar, it will be perceived to change its fituation in the heavens. For a fpectator in A would fee the ftar in the line A Pa; in C be would fee the fame tlar in the line CPc;
and fo in any other point of his progrefs; whence it follows, that the far would feem to defcribe a circle in the heavens reprefented by $a b c d$. If the diftance of the Itar was fo very great, that in refpect of it the diameter of the carth's orbit A C might be efteemed a point; in this cafe, the forefaid circle would be entirely infenfible; all the lines drawn from the points of the orbit to the ftar might pals for per. pendiculars to the plane of the ecliptic, and in appearance would correfpond to the fame point in the heavens with the perpendicular in $S$, in which point the Itar would always appear, if its light could reach us in an inltant. But if in this cafe, where the flar is fo remote, the light is fuppofed to be propagated from the flar with a cercain velocity, at the fame time that the earth proceeds in its orbit, the ftar will be feen in an oblique direction to the plane of the orbit; becaufe of the motion compounded of the motion of light, and that of the ipectator.
Suppofe the light to move in the line E G (fig. 3.) making an angle with the line F G, in which the Ipectator is carried along; whom we fhall conceive placed in F. Let the velocity of the fpectator be to the velocity of the light, as F G to E G. While the feectator moves along FG, the light does the fame along EG ; and the particle of light, which is in $E$ when the fpectator is in $F$, enters the eye only when he arrives at G. Now the direction of the light, with refpect to the eye, makes with the line F G the angle EFG. For if we conceive the line FE drawn, and to be carried with a parallel metion along with the eye, fo that in refpect thereof it be at reft, while this continues moving, the light will reach the cye in the direction of the faid line; for when the eye fhall be in $f$, the middle point between $F$ and $G$, the transferred live, will cut E G in its middle point $g$, to which the parsicle of light has reached, and which is likewile the middle point of the transferred line $f e$; wherefore the particle of light, which was in E , in the extremity of the line E E, arrives at, and will enter the cye in the direction e g.
Let the angle E G.F ( figi 4.) be a right cne, and E G to FG as the velocity of the light to the velocity of the earth in its orbit ; then EF G will be the angle, which the ray of light entering the eye, makes with the plane in which the earth moves round the fun.

If the earth be in $B$ (fy. 5.) it mores in the direction of the tangent to its orbit in this point ; that is, if we fup. pofe the fpectator in the fun, the direction of the earth's motion is parallel to SC; and making the angle aSC equal to the angle EGF in the former figure, the line $\mathrm{S} a$ will reprefent the line in which the fpectator would fee the ftar.

In the fame manner when the earth is in $D$, the feectator in the fun will fee the ftar in $S c$, the angles $P$ S $c$ and $P S ;$ being equal; and the line $S a$ or $S c$, by its revolution aboat PS, would defcribe a cone, whofe bafe in the heavens would be a circle reprefenting the apparent path of the ftar through a whole year. Let us fuppofe this circle to be $a b c d$, as in fig. 5.

When the ftar is not in the perpendicular to the plane of: the ecliptic, but the line PS (fo. Go.) is inclined to that plane, the lines which determine the apparent motion of the Star in the heavens. will form cones, as in the cafes already explained; only they would be oblique, and in both cafes the apparent path of the flar in the heavens would be determined as above: but in this laft cafe it would be an ellipfis, the greater diameter of which would be equal to the diameter of the circle abcd of the former figures; fo that snowing this ellipfis, the circle might eafily be found which
the flar would deferibe, if placed in the perpendicular to the plane of the ecliptic.

The only way to determine, whether the fars defcribe fuch elliples, is by obfervations; in making which there are great dillicultics, which, however, Dr. Bradley has with incomparable indultry furmounted.
Nothing can immediately be determined concerning the forefaid elliptic motion. The diftance of the ftar from the pole of the world mult be meafured at different times of the year, and from the different dillances the elliptic motion is to be determined by calculation, allowing for the motion of the pole itfelf during the fpace of time between the obfervations, for the pole moves in a leffer circle, one degree of which it paffes over in feventy-two years.

Dr. Bradley, making all neceffary allowances, obferved feveral itars at different times of the year, whereby he immediately difcovered, that their diftances from the pole of the world varied; and was convinced that this variation could not be attributed to the nutation of the pole; for he examined two ftars at equal diflances from the pole, but fo oppofite, that the one ought to have receded from the pole as much as the other acceded to it, if the motion was in the pole itfelf. But this did not fall out fo ; for the change of the one ftar was double of that of the other; a proper allowance being always made for the pole's motion arifing from the above revolution. However, this indefatigable obferver inferred fronz his obfervations, that the flars in certain times receded from, and acceded to, the pole of the world with a motion entirely analogous to that which is performed in an ellipfis; and alfo that they move in fuch curves, for each of which the motion in the fame little circle, as abcd (fig 6. ) anfwers, when the ftars are referred to the perpendicular in $S$ to the plane of the ecliptic; and the diameter of this minute circle for them all is $40 \%$.
It is plain from obfervations, to which of the above mentioned caufes we are to afcribe the motion of the ftar. For if the firft takes place, the flar would be carried from a to $c$, while the earth paffed over the part A B C of its orbit; but this, being contrary to obfervation, cannot be the true caufe. But this change in the fituation of the far takes place according to the obfervations, while the earth defcribes the part BCD of its orbit, which is jult what the fecond caufe requires.

If both the caufes took, place at the fame time, the arc defcribed by the earth would differ from that indicated by either of them; befides, this concurrence of the caufts is contrary to the obfersations; uulefs. perhaps, it may be thought reafonable to attribute a little infuence to the firft caufe; but fo very fmall a portion, as not to be fenlibly perceived in the obfervations.

Dr. Bradley himfelf confidered this matter in the following manner: he imagined C A (Plate IX. Optics; fg. 7.) to be a ray of light falling perpendicularly ufor the line B D ; that, if. the eyc is at reit at A , the object mult ap. pear in the direction A C, whether light be propagated in time or in an intant. But if the eye is moving from B towards A, and light is propagated in time, with a velocity that is to the velocity of the eye as CA.to B.A, then light, moving from $C$ to $A$, whilt the eye moves from $B$ to $A$, that particle of it by which the object will be difcerned when the eye comes to A , is at C , when the ege is at B . Joining the points B, C, he fuppofed the line C B to be a tube, inclined to the line BD in the angle D.BC, of fuch a diameter as to admit but one particle of light. Then it was eafy to conceive, that the particle of light at C , by. which the object mult be feen, when the eye, as it moves along, arrives at. $A$, would pafs through the tube B C, if

## LIGHT.

it is inclined to $B \mathrm{D}$ in the angle D BC , and accompanies the eye in its motion from $B$ to $A$; and that it could not come to the eye placed behind fuch a tube, if it had any other inclination to the line $B$ D. If, inftead of fuppofing $C B$ fo fmall a tube, we imagine it to be the axis of a larger ; then, for the fame reafon, the particle of light at C would not pars through that axis, unlefs it is inclined to $\mathbf{B D}$ in the angle CBD. In like manner, if the eye move the contrary way, from D towards A , with the fame velocity, then the tube mult be inclined in the angle BDC. Although, therefore, the true or real place of an object is perpendicular to the line in which the eye is moving, yet the vifible place will not be fo, fince that, no doubt, mult be in the direction of the tube; but the difference between the true and apparent place will be, cateris paribus, greater or lefs, according to the different proportion between the velocity of light and that of the eye. So that if we could fuppofe that light was propagated in an inftant, then there would be no difference between the real and vifible place of an object, although the eye were in motion; for in that cafe, A C being infinite with refpect to AB , the angle ACB , the difference between the real and vifible place, vanifhes. But if light be propagated in time, it is evident, from the foregoing confiderations, that there will be always a difference between the true and vifible place of an object, unlefs the eye is moving either directly towards or from the object. And in all cafes the fine of the difference between the real and vifible place of the object will be to the fine of the vifible inclination of the object to the line in which the eye is moving, as the velocity of the eye is to the velocity of light.

He then fhews that if the earth revolve round the fun annually, and the velocity of light be to the velocity of the earth's motion in its orbit, as one thoufand to one, that a ftar really placed in the very pole of the ecliptic, would, to an eye carried along with the earth, feem to change its place continually; and neglecting the fmall difference on the account of the earth's diurnal revolution on its axis, would feem to defcribe a circle round that pole every way diftant from it $3^{\frac{1}{2}}$; fo that its longitude would be varied through all the points of the ecliptic every year, but its latitude would always remain the fame. Its right afcetfion would alfo change, and its declination, according to the different lituation of the fun with refpect to the equinoctial points, and its apparent diftance from the north pole of the equator, would be $7^{\prime}$ lefs at the autumnal than at the vernal equinox.

The greateft alteration of the place of a far in the pole of the ealiptic, or which, in effect, amounts to the fame thing, the proportion between the velocity of the light and the earth's motion in its orbit being known, it will not be difficult, he obferves, to find what would be the difference, upon this account, between the true and apparent place of any other ftar at any time; and, on the contrary, the difference between the true and apparent place being given, the proportion between the velocity of light and the earth's motion in its orbit may be found.

From all which the following conclufions may be deduced : 1. That the fecond caufe above-mentioned alone takes place in this cafe, viz. that the diftance of the ftars is fo great, that the diameter of the earth's orbit has no fenfible proportion to it. 2. That the angle F E G (fig. 3.) in the above mentioned triangle, is $20^{\circ} \frac{18}{4}$; or, fince the apparent declination of the Itar $\gamma$ Draconis, obferved by Dr. Bradley, on account of the fucceffive propagation of light, would be to the diameter of the little circle which a ftar would feem to defcribe about the pole of the ecliptic as $39^{\prime \prime}$ to $40^{\prime \prime} \cdot 4$; the
half of this is the angle ACB (fig. 7.) which is equal to $20^{\prime \prime} .2$; and confequently the ratio of E G to F G (fig. 3.) or of A C to A B (fig. 7.) or the velocity of the light to the velocity of the earth in its orbit, as 10210 to 1; whence it follows, that the light comes from the fun to the earth in $8^{\prime} 12^{\prime \prime}$. This, Dr. Bradley obferves, is very probably the truth, becaufe it is a medium between 7 and 11, which were the times which it had before been fuppofed to take up, according to different obfervations of the eclipfes of Jupitcr's fatellites. Comparing his obfervations on other ftars, he afterwards concluded, that light is propagated from the fun to the earth in $8^{\prime} 13^{\prime \prime}$; and the near agreement of his obfervations induced him to think, that this fuppofition could not differ fo much as a fecond of a degree from the truth; fo that the time which light fpends in paffing from the fun to us may be determined by thefe obfervations within $5^{\prime \prime}$ or $10^{\prime \prime}$, which is fuch a degree of exactnefs. as we can never hope to attain from the eclipfes of Jupiter's fatelites. 3. That the light prodeeds with the fame velocity from all the ftars; for all have the fame angle FEG. Whence (if we fuppofe that all the flars are not equally diftant from us, as many arguments prove) it will follow, that the motion of light, all the way it paifes through the immenfe fpace above our atmofphere, is equable or uniform. And fince the different methods of determining the velocity of light thus agree in the refult, it is reafonable to conclude, not only that the phenomena above recited are owing to the caufes to which they are afcribed, but alfo that, in the fame medium, light is propagated with the fame velo. city after it has been reflected, as before. 4. Laftly, it mult be confidered, that very fmall differences cannot be perceived; and nobody will deny, but that in meafuring a fmall angle, an error of a fecond may be committed, whatever care is ufed to prevent it; and therefore, although we have faid, that the firlt caule is to be rejected, we do not deny that the fars may poffibly by its influence defcribe a minute circle, whofe diameter is $\mathbf{I}^{\prime \prime}$, or even a little more. S'Gravefande's Phyf. Elem. Math. lib. iii, cap. I. p. 708 , feq.

Hence it appears, that the fucceffive propagation of light will caufe an aberration in the appearances of the ftars, planets, and comets. (See Absbration.) After Dr. Bradley had difcovered this caufe of error in the apparent places of the fixed ftars, M. Clairaut and others inveltigated feveral rules for the computation of this aberration. M. Euler alfo has given us a paper on this fubject. Mem. Acad. Scienc. 1756. Mr. Simpfon, in his Eflays. Mem. de l'Acad. de Berlin, tom. ii. p. I4I, feq.
See remarks on the effect of the aberration of light on the time of the tranfit of Venus over the fun, by Dr. Price, in Phil. Tranf. vol. lx. art. 47. p. 536.

For an account of Mr. Melville's hypothefis of the different velocities of differently coloured rays, fee Refrangibility.
Whether the light emitted by candles and other luminous bodies acquires the fame velocity it is difficult to determine. So far as our knowledge extends on that head, it does not appear inferior to folar light.
But to return to the hypothenis of preffure, by which fome have accounted for the propagation of light, it might be obferved farther, if light were not a body, but confilted in a mere preffion, or pulfion, it would never be propagated in right lines, but would be continually inflected ad umbram. Thus fir Ifaac Newton: "A preffure on a fluid medium, i. e. a motion propagated by fuch a medium, heyond any obftacles, which impedes any part of its motion, cannot be propagated in right lines, but will be always inflecting and
diffufing

## LI G H T.

diffufing itfelf cvery way, to the quiefeent medium beyond that obftacle. The power of gravity tends downwards; but the preflure of water arifing from it tends every way with an equable force, and is propagated with equal eafe, and equal ftrength, in curves, as in itraight lines. Waves, on the furface of the water, gliding by the extremes of any very large obftacle, inflect and dilate themfelves, ftill diffuf. ing, gradually, into the quiefcent water beyond that obitacle. The waves, pulfes, or vibrations of the air, wherein found confifts, are manifeftly inflected, though not fo confiderably as the waves of water; and founds ate propagated with equal eafe, through crooked tubes, and through Araight lines; but light was never known to move in any curve, nor to inflect itfelf ad umbram." The rays of light, therefore, are fmall corpufcles, emitted with exceeding celerity from the luminous body. As to the force wherewith thefe corpufcles are emitted, fo as to enable them to move at the inconceivable rate of 200,000 miles a fecond ; the fame great author obferves; " Among bodies of the fame kind and virtue, by how much any one is fmaller, by fo much is its attractive power greater in proportion to its bulk. This power we find ftronger in fmall magnets, than in large ones, regard being had to the difference of their weights : and the reafon is, that the particles of fmall magnets bcing nearer each other, more eafly unite their forcés intimately together. and act conjunctly. For the fame reafon the rays of light, being of all other bodies the molt minute, it may be expected that their attractive powers fhould be, of all others, the frongeft ; and how ftrong in effeet they are, may be gathered from the following rules: the attraction o ray of light, accordiag to the quantity of its matter, is to the gravity which any projected body bas, according, likewife, to the quantity of its matter, in a ratio compounded of the velocity of the ray of light, to the velocity of that projected body, and of the bending or curvature of the line which the ray defcribes in the place of refraction, to the bending of the curvature defcribed by that projected body ; provided, however, the inclination of the ray to the refracting furface be the fame with that of the projected body to the horizon. From which proportion I gather, that the attraction of the rays of light is above $1,000,000,000,000,000$ times greater than the gravity of bodies on the furface of the earth, in proportion to the quantity of matter in each, if the light pals from the fun to the earth in the fpace of feven minutes. But now, as in algebra, where affirmative quantities ceafe, there negative ones begin; fo in mechanics, where attraction ceafes, there the repelling power mull fucceed: theretore a ray of light, as foon as it is calt off from the luminous body, by the vibrating motion of its parts, and is got out of the fphere of its attraction, is propelled with an immenfe velocity:"

The wonderful divifibility of the parts of matter is nowhere more apparent than in the minutenefs of the particles of light. Dr. Nieuwentyt has computed, that an inch of candle, when converted to light, becomes divided into $269,617,040$ parts, with 40 ciphers annexed; at which rate there muit iffue out of it, when burning, $4^{18,660}$, with 39 ciphers more, particles in the fecond of a minute; valtly more than a thoufand times a thoufand million times the number of fands the whole earth can contain; reckoning ten inches to one foot, and that 100 fands are equal to one incl. See Relig. Philof. vol iii. p. 865.

It muft be acknowledged, that many difficulties and objections have been urged againft the materiality of light, or the ilypothefis of light's confiting of fmall particles emitted from Juminous bodies ; and that many eminent philofophers, both foreigners and Englifh, have recurred to the opinion, that

VUL. XXX.
light confits of vibrations propagated from the laminous body through a fubtile etherial medium.

The ingenious Dr. Franklin, in a letter dated April 23d, 1752, expreffes his diffatisfaction with the doctrine, that fuppofes particles of matter, called light, continually driven off from the fun's furface, with a fwifnefs fo prodigious. "Muft not," fays he, "the fmalleft portion conceivable have, with fuch a motion, a force exceeding that of a twenty-four pounder difcharged from a cannon? Mult not the fun diminifh exceedingly by fuch a wafte of matter; and the planets, inllead of drawing nearer to him, as fome have feared, recede to greater diftances through the leflened attraction? Yet thefe particles, with this amazing motion, will not drive before them, or remove, the leait and lighteft duft they meet with ; and the fun appears to continue of his anci nt dimenfioss, and his attendants more in their ancient orbits." Accordingly, he conjectures, that all the phenomena of light may be more conveniently folved, by fuppofing univerfal fpace filled with a fubtile claftic fluid; which, when at reft, is not vifible, but whofe vibrations affect that fine ferife in the eye, as thofe of air do the groffer organs of the ear: and that different degrees of the vibration of this medium may occafion the appearances of different colours. The elaftic fluid, he fays, is always the fame, and yet rieaker and fronger fparks differ in apparent colour, fome white, blue, purple, red ; the ftrongeit, white ; the weak ones, red. Franklin's Exp. and Obf. \&c. p. 264, \&c. ed. 1769.
The celebrated Mr. Euler (as we have already obferted), has alfo ftrenuoufly maintained the fame hypo. thefis, in his Theoria Lucis \& Colorum. In the fummary of his arguments againft the common opinion, recited in Acad. Berl. 1752. p. 271, befides the objections aborementioned, he difputes the poffibility, that particles of matter, allowed to move with the amazing velocity of light, fhould penetrate tranfparent fubflances with fo much eafe. In whatever manner they are tranfmitted, thofe bodies muft have pores, difpofed in right lines, and in all poffible directions, in order to form canals for the paffage of the rays: but fuch a ftructure mult take away all folid matter from thofe bodies, and all coherence among their parts, if they do contain any folid matter.

Dr. Horley has taken coafiderable pains to obviate the difficulties fuggefted by Dr. Franklin; and fuppofing that the diameter of each particle of light docs not exceed one millionth of one millionth of an inch, and that the denfity of each particle is three times that of iron, that the light of the fun traverfes the femi-diameter of the orbis magnus in $7^{\prime}$, and that this femi-diameter is 229 Ig femi-diameters of the earth, he calculates, that the momentum or force of motion in each particle of light coming from the fun, is icfs than that in an iron ball of $\frac{1}{4}$ th of an inch diameter, moring at the rate of lefs than an inch in twelve thoufand millions of millions of Egyptian years. Hence, he concludes, that a particle of matter, which is probably larger than any particle of light, moving with the velocity of light, has a force of motion, which, inftead of exceeding the force of a twenty-four pounder difcharged from a cannon, is infinitely lefs than that of the fmalleft fhot difcharged from a pocket-pitol, or lefs than any that art can create. Moreover, he thinks it poffible, that light may be produced by a continual emififion of matter from the fun, without any fuch walte of bis fubitance as fhould fenfibly contraft his dimenfions, or alter the motions of the planets, within any moderate length of time. In proof of this, he obferves, that it is not neceffary to the production of any of the phenomena of light, that the emanation from the fun fhould be continual in a itrict mathe: matical fenfe, or without any interval; and likevife that

5 B
part

## LI G H T.

part of the light which iffues from the fun is continually returning to him by reflection from the planets, and other light is continually coming to him from the funs of other fyitems. He proceeds by calculation to thew, that in $3{ }^{3} 5,130,000$ Egyptian years, the fan would lofe ${ }_{73} 3^{\frac{1}{2}}{ }^{2} \mathrm{~d}$ of his matter, and, therefore, that the gravitation towards the fun, at any given dittance, would diminifh in the fame proportion. But this alteration is much too fmall to difcover itfelf in the motion of the earth, or of any of the planets. He alfo computes, that the greatelt Aroke which the retina of a common eye fultains, when the cye, in a bright day, is turned up directly to the fun, does not exceed that which an iron fhot, $\frac{1}{4}$ th of an inch diameter, would give, moving only at the rate of 16.16 inches in a year; but the ordinary ftroke is lefs than the $\pi_{2}^{2} 544^{2}$ th part of this. (Phil. Tranf. vol. 1x. art. 35. vol. lxi. part ii. art. 50.) One of the principal difficulties attending the hypothefis of the materiality of light, is the non-interference of its particles with each other. There is, probably, fays Mr. Melville, Edinb. Eff. vol. ii. p. 17, \&c. no phylical point in the vifible horizon, that does not fend rays to every other point, unlefs where opaque bodies interpofe. Light, in its paffage from one syitem to another, often paffes through torrents of light ifluing from other funs and fy flems, without ever interfering, or being diverted from its courfe either by it, or by the particles of that elaftic medium, which fome have fuppofed to be diffufed through all the mundane fpace. In accounting for this fact, he fuppofes that the particles of light muft be incomparably rare, even when they are the moft denfe ; that is, that the femidiameters of $t$ wo of the neareft particles, in the fame, or in different beams, foon after their emifion, are incomparably lefs than their diftance from one another. This confideration obviates the objection urged by Euler and others againft the materiality of light, from its infuence in difturbing the freedom and perpetuity of the celeltial motions. Bofcovich and others folve the difficulty concerning the non-interference of the particles of light, by fuppofing that each particle is endued with an infuperable impulfive force; but in this cafe, their fpheres of impulfion would be more liable to interfere, and they would, on that account, be more likely to difturb one another. This difficulty, attending the fuppofition, that particles of light move through other light, in all imaginable directions, without perpetual collifions among the particles, and continual defections from a rectilinear courfe, is, in a great degree, obviated, by an eafy computation of Mr. Canton. He obferves, that it is neceffary to allow only a very fmall portion of time between the emiffion of every particle, and the next that follows in the fame direction. Suppofe, for inftance, that one lucid point of the fun's furface emits 150 particles in one fecond, which are more than fufficient to give continual light to the eye, without the leaft appearance of intermiffion-; yet ftill the particles of which it confints will, on account of their great velocity, be more than a thoufand miles behind one another, and thereby leave room enough for others to pafs in all directions. Phil. Tranf, vol. lviii. art. 45: p. 344 .

If we alopt the conclufions drawn from the chevalier d'Arcy's experiments on the duration of the fenfations excited by light, who ftates it at the feventh part of a fccond (Hirt. Acad. Scienc. 1765, Mem. 2.) we may admit an interval of more than 20,000 miles between each particle. Some, in order to anfwer the chief objections of this kind againll the materiality of light, have adopted the hypothefis of M. Befcovich; who advances, in his Theoria Philofophix Naturalis, that matter is not impenetrable, but that it confifts of phyfical points only, endued with
powers of attraction and repulfion, taking place at different diftances ; that is, furrounded with various fpheres of attraction and repulfion, in the fame manner as folid matter is generally fuppofed to be ; provided, therefore, that any body move with a fufficient degree of velocity, or have fufficient momentum, to overcome any powers of repulfion it may meet with, it will find no difficulty in making its way through any body whatever; for nothing will interfere or penetrate one another, but powere, fuch as we know, do, in fact, exit in the fame place, and counterbalance or overrule one another. Prieftey's Hilt. \&c. of Light, \&c. p. 39 I . That light is a real fubtance, notwithftanding the objections that have been urged againft this hypothefis, feems to be ettablifhed by the phenomena of the Bolognian ftone, and of other fubitances, which poffefs the remarkable property of imbibing light, of retaining it for fome time, and afterwards of emitting it. See Phosphorus, and the fequel of this article.
The doctrine of the materiality of light is farther confirmed by thofe experiments, which demonftrate, that the colour and inward texture of fome bodies are changed, in confequence of their being expofed to the light.

The firft obfervation of this kind appears to have been made by M. Duhamel, who found that the juice of a certain fhell-fifh in Provence contracted a fine purple colour when it was expofed to the light of the fun, and that the ftronger was the light, the more fplendid was the colour. Pieces of cloth dipped in this liquor, and expofed to the fun, became red, though they were inclofed in glafs; but they acquired none of this colour in the fame expofure, if they were covered with the thinneft plates of metal. It was afterwards obferved by Beccarius, Com. Bonon, vol. iv. p. 75, that a quantity of luna cornea, expofed to the rays of the fun, became of a violet colour, whillt part of the fame compofition, covered with black paper, remained white. This effect was found by M. H. Schulze to depend on the filver that happened to be in it. (Ac. Crefar. vol. i. p. 528, \&c.) G. Bonzius was thus led to fome fisbfequent experiments, which feem to prove that various colours are confio derably affected by light, exclufive of heat or any thing elfe. By expofing ribbons of different colours to the rays of the fun for feveral days in the open air, he found that all, except the yellow and light green, loft part of their luftre, and were confiderably faded; but when the fame ribbons were expofed to a much greater degree of heat in a dark room, none of the colours were affected, except that a fmall part of their luftre was loft; nor was any fenfible change made in them after remaining for a confiderable time in a room that faced the north. By inclofing them in an exhaufted receiver, he found that the change was not occafioned by the air; but no change could be produced in them by the light of torches. Beccarius alfo found by experiments on paper, and a great variety of fubftances, mineral, vegetable, and animal, that the light of the fun produced many changes in the internal ftructure of bodies, and that thofe fubflances which imbibed light were much injured. The ftronger the light, and the longer they were expofed to it, the more injury they regeived; and the injury thus fuftained was found to be lafting. Com. Bon. vol. vi. p. 77, \&c. See Prieftley's Hiftory, p. 378, \&c.

Some writers have attempted to prove the materiality of light, by determining the momentum of their component particles, or by flewing that they had a force, fo as, by their impulfe, to give motion to light bodies. M. HombergAc. Par. 1708. H. p. 25, imagined, that he could not only difperfe pieces of amianthus, and other light fubftances, by the impulfe of the folar rays, but alfo that by throwing

## LI G H T.

them upon the end of a kind of lever, connected with the fpring of a watch, he could make it move fenfibly quicker; whence, and from other experiments, was inferred the weight of the particles of light. But M.Du Fay, and M. Mairan, made other experiments of a more accurate kind, which exhibited no fuch effects as M. Homberg imagined. How. ever, Dr. Priefley informs us, that Mr. Mitchell endeavoured to afcertain the momentum of light with fill greater accuracy, ane that his endeavours were not altogether unfuccefsful. Having found that the initrument which he ufed acquired, from the impulfe of the rays of light, a velocity of one inch in a fecond, he inferred, that the quantity of matter contained in the rays falling upon the inftrument at that time, amounted to no more than one twelve hundred millionth part of a grain. In the experiment, the light was collected from a furface of about three fquare feet; and as this furface reflected only about half what falls upon it, the quantity of matter contained in the rays of the fun, incident upon a fquare foot and half of furface in one fecond of time, ought to be no more than the twelve hundred miilionth part of a grain, or upon one fquare foot only, the eighteen hundred millionth part of a grain. But the denfity of the rays of light at the furface of the fun is greater than at the earth, in the proportion of 45000 to 1 ; there ought, therefore, to iffue from one fquare foot of the fun's furface in one fecond of time, in order to fupply the wafte by light, one forty thoufandth part of a grain of matter ; that is, a little more than two grains a day, or about four millions feven hundred and fifty-two thoufand grains, which is about fix hundred and feventy pounds, avoirdupois, in fix thoufand years; a quantity which would have fhortened the fun's femi-diameter no more than about ten feet, if it was formed of matter of the denfity of water only. Prieftey, ubi fupra, p. 389 .

The nature of light has not been fatisfactorily afcertained by any of the experiments and inveftigations of philofophers. Some incline to the Newtonian hypothefis, which afcribed it to the emiffion of very minute particles from luminous fubitances, as we have already ftated; and others to the excitation of an undulatory motion, analogous to that which conititutes found, in a very rare and elaftic medium, which pervades the univerfe. There are alfo fome circumflances which induce thofe who entertain the firf hypothefis, either to believe, with Newton, that the emanation of the particles of light is always attended by the undulations of an etherial medium, accompanying it in its paffage, or to fuppofe, with Bofcovich, that the minute particles of light themfelves receive, at the time of their emifion, certain rotatory and vibratory motions, which they retain as long as their projectile motion continues. Thefe additional fuppofitions, howeser neceflary they may have been thought for explaining fome particular phenomena, have never been very generally underftood or admitted, although no attempt has been made to accommodate the theory in any other manner in thefe phenomena. Dr. Young, in his "Courfe of Lectures on Natural Philofophy, \&c." has examined in detail the manner in which the two principal hypothefes refpecting light may be applied to its various affections and properties; for which we refer to vol. i. p. 45 8, \&c. to the fequel of this article, and to other appropriate terms that occur in the Cyclopædia.

The expanfion or extenfion of any portion of light is inconceivable. Dr. Hook thews it is as unlimited as the univerfe; proving it from the immenfe diftance of fome of the fixed ftars, the light whereof becomes fenfible to the eye by means of a telefcope: nor, adds he, are they only the great bodies of the fun or flars that are thus
liable to difperfe their light through the yaft expante of the univerfe, but the fmalle:t fpark of a lucid body mult do the fame, even the fralieft globule ftruck from a feel by a flint.
The method of meafuring the intenfity of different lights, or of the fame light in different circumftances, affords a curious fubject of inveftigation. M. Bouguer purfued is with particular attention, and defcribed an apparatus which he has contrived for this purpofe, in his Traite de Optique, publifhed in Paris, 1760. Dr. Prieftley (ubi infra) bas given an abridged account of the two methods ufed for this purpofe by M. Bouguer. The firft of thefe two methods has been ufed by others fince, and probably before that time, and particularly by count Rumford. See Psotometer.
It is well known that the action of a ftrong light upon the eye, and alfo the impreffion which it leaves upon the eye, makes it infenfible to the effect of a weaker light. M. Bouguer found, that when one light is fixty-four times lefs than another, its prefence or abfence will not be perceived ; and, allowing for different effects on different eyes, he fuppofes that the boundaries, with refpect to different perfons, may lie between fixty and eighty. Being unable to determine the variation of the light of the fun, becaule it is too ftrong, and that of the flars, becaufe it is too weak, at different altitudes, he made his obfervations on the moon, the diminution of the light being in the fame proportion in this cafe and in the others, and found that its light at $19^{\circ} 16^{\prime}$ is to its light at $66^{3} 11^{\prime}$, as 1681 to 2500 ; or the one is nearly two-thirds of the other. When one limb of the moon touched the horizon of the fea, its light was two thoufand times lefs than at the altitude of $66^{\circ} \mathrm{II}^{\prime}$. But this proportion, he fays, is liable to variations, the atmofphere near the furface of the earth varying fo much in its denfity. Hence he concludes, that, at a medium, light is diminifhed in the proportion of about 2500 to 168 I , in traverfing 7469 toifes of denfe air. He alfo found, that the centre of the fun is confiderably more Iuminous than the extremities of it ; whereas, both the primary and fecondary planets are more luminous at their edges than near their centres. In a comparifon of the light of the fun and moon, he compared each of them to that of a candle in a dark room, one in the day time, and the other in the right following, when the moon was at her mean diftance from the carth, and, after many trials, he concluded, that the light of the fun is about three hundred thoufand times grater. than that of the moon; and, therefore, it is no wonder that philofophers have had fo little fuccefs in their attempts to collect the light of the moon with burning.glaffes; for the largeft of them will not increafe the light a thoufund times, which will ftill leave the light of the moon, in the focus of the mirror, three hundred times lefs than the intenfity of the common light of the fun. Dr. Smith, in his Optics, vol. i. p. 29, thought that he had proved, from two different confiderations, that the light of the full moon would be to our day-light as I to about gogoo, if no rays were loft at the moon. His method of calculation follows, as far as it is juft, fays Mr. Robins, Math. Tracts, vol. ii. p. 225, directly from the propofition for the fame purpofe of that excellent geometer, James Gregory, in his Geom. Par. Univerf. P. 144; and the general propofition there mentioned for dillinguifhing the proportion between the degrees of light received from any planet, and from the fun, as repeated in David Gregory's Aftronomy, lib. iii. prop. 58. Mr. Robins remarks, that though his eltimate is founded on the fuppofition, that the moou reflects all the light it receives from the fun; yet his argunent is drawn from com-

## LIG HT.

paring the light of the moon feen in the day with the light of the clouds; that is, is deduced from the quantity of light actually reflected by the moon. In the firit place he fuppoies that the moon, enlightened by the fun, is as luminous as the clouds are at a medium. He, therefore, fuppoled the light of the fun to be equal to that of a whole hemifphere of clouds, or as many moons as would cover the furface of the heavens. But upon this it may be obferved, that the light of the fus thining perpendicularly upon any furfaec, would be equal to the light reflected from the whole hemifphere, if every part of it reflected all the light that fell upon it ; but the light that would, in fact, be reccived from the whole hemifphere (part of it being reseived obliquely) would be only one-half as much as would be received from the whole hemifphere. if every part of it fhone directly upon the furface to be illuminated. In his Remarks, \&c. P. 17, he draws the fame conclufion from a different method of induction ; but in this cafe alfo he made a miltake of one-half, fuppofing all the enlightened hemiSphere of the moon to receive the direct rays of the fun; whereas, in fact, no more can be received than would fall perpendicularly on the fuperficial fection of one great circle, which is juit one-half of the furface of the hemifphere. Prieftley, ubi fupra, p. 540, \&c.

Mr. Mitchell made this computation in a more eafy and accurate manner. Confidering the diftance of the moon from the fun, and that the denfity of the light muft decreafe in the proportion of the fquare of that diftance, he calculated the denfity of the fun's light at that diftance, in proportion to its denfity at the furface of the fun: and in this manner he found that, if the moon reflected all the light it receives from the fun, it would be only the 45000 dth part of the light we receive from that greater luminary. Admitting, therefore, with M. Bonguer, that the moon refects only a 300,000 dh part of it, Mr. Mitchell concludes, that it reflects no more than betwixt the fixth and feventh part of the light that falls upon it. Phil. Tranf. vol. lvii. art. 27, P. 234, \& c .

Dr. Pemberton, in his Courfe of Chemiftry, lect. 2. ftates the greateft light which we can receive from the moon, when at the full, and neareft to the earth; to exceed the light of the fun more than 87,000 times, fuppofing that the moon reflected all the light of the fun which falls upon it ; but if it reflects only half the light that falls upon its furface, which is the moft that can be fuppofed, then the light of the moon will be exceeded by the fun's light more than 170,000 times: and in the mean diftance of the moon from the earth, her light will be exceeded by the fun more than 190,000 times.

The mutual action between light and other matter is produttive of numerous phenomena. Thefe of late have confituted two diftinct branches of fcience. The one has for its object the inveltigation of the phyfical properties of light, for which we are principally indebted to Newton, and which forms the bafis of the fience of optics. The other is confined to the chemical agency of light, refting upon facts difcovered fince the time of that great genius, and which has hitherto occupied the attention of the chemical philofopher.

When a ray of light falls upon the furface of a body, it is either reflected, abforbed, and extinguifhed, or tranfmitted. And under fome circumftances all thefe effeets take place.

The reflection of the ray depends, firft, upon the nature of the body; fecondty, upon the ftate and colour of the furface; and, thirdly, upon the quantity of the angle of incidence. Under all thefe circumftances, however, the angle
at which the ray is rellected is equal to the angle of incidence. The fame laws, therefore, which govern the collifion between perfectly elattic bodies and ablolutely hard furfaces, may be applied to the reflection of light. Of the different bodies which reflect light, metals poffeis this power in the greatelt degree, and perhaps in proportion to their denfity and hardnefs. Smooth or polifhed furfaces reflect more light than rough ones.

Of coloured furfaces the lighteft colours reflect the molt; hence the whiteft metals make the beft reflectors. The order will therefore, in all probability, be as follows, begin* ning with the beft reflectors, white, yellow, red, blue, black. The two extremes are very ftriking, in the wellknown experiment of two pieces of cloth, one white and the other black, laid on the furface of foow in the fun. The black piece very foon finks into the fnow, from abforbing a greater quantity of light, which caufes the heat. The white piece reflects a greater portion, and is longer in becoming heated. With regard to the quantity of reflection, as affected by the angle of the incidence; it is found that opaque bodies are more heated as the rays ftrike their furfaces more perpendicularly, and the quantity of light which enters tranfparent bodies is as the fame. In both inftances, therefore, more light enters the bodies, and lefs is reflected. In the firlt inftance, the light which is not re-flected becomes extinguifhed, producing heat; in the fecond it is tranfmitted, itill retaining the property of light. Hence, therefore, we ought to conclude that the reflection will be inverfely as the angle of incidence, fuppofing the angle to be formed by the ray and the furface of the medium.
M. Bouguer has informed us, that the light reflected from a furface of mercury, when the angle of incidence was $I i_{2}^{\frac{1}{2}}{ }^{\circ}$, was only equal to $\frac{1}{4}$ th of the whole; and he thinks it probable that no fubltance reflects more. It is certain, however, that polifhed filver reflects much more. The fame philofopher obferves, that metallic reflectors change lefs. in their poiver of reflection with the angle of incidence. He made the following experiment with polifhed black marble. At an angle of $33^{\prime} 35^{\prime}$ with the reflecting furface, 6 were reflected, the whole being unity; at $15^{\prime}$ of incidence, 156 were reflected; at $30^{\prime}, .051$; and at $80^{\circ}, .023$. The relt of courfe became extinguifhed, and would heat the marble.

A fimilar diminution of the reflective power, with the angle of incidence, is obferved in tranfparent bodies, by the fame author. The following Table gives the refults with water and plate-glafs.

| Anğle of Incidence. | The Quantity of Light reflefed, the whole being 1000. |  |
| :---: | :---: | :---: |
|  | From Water, | Fron Plate-Glass. |
| $\frac{1}{2}{ }^{\circ}$ | 721 |  |
| 1 | 692 |  |
| $1 \frac{1}{2}$ | 669 |  |
| 2 | 639 |  |
| $2 \frac{1}{2}$ | 614 | $5^{8}+$ |
| 5 | 501 | $5+3$ |

| Angle of Incidence. | The Quassity of Light reflected, the whole being 1000 . |  |
| :---: | :---: | :---: |
|  | From Water. | From P'late-Gilafs, |
| $7^{\text {c }} \frac{1}{2}$ | 409 | 474 |
| 10 | 333 | 412 |
| 12 $\frac{1}{2}$ | 271 | 356 |
| 15 | 211 | 299 |
| $1 \rightarrow \frac{1}{2}$ | 178 |  |
| 20 | I 45 | 222 |
| 25 | 97 | 157 |
| 30 | 65 | 112 |
| 40 | 34 | 57 |
| 50 | 22 | 34 |
| 60 | 19 | 27 |
| 70 | 18 | - 25 |
| 80 | 18 | 25 |
| $9^{\circ}$ | 18 | 25 |

The reflections in this inftance are partly made from the upper, and the reff from the under furface. The remainder of the thoufand parts are tranfmitted, with the exception of a few, which are in all probability extinguifhed.

That, under certain circumitances, the rays of light are extinguifhed, evea in tranfparent bodies, is rendered highly probable by the above inquirer.
Light becomes fo far extinct, by paffing through 679 feet of fea-water, as to render it opaque ; and a length of feven feet of water has been found to intercept one-half of the light which enters it.
M. Bouguer tells us, that if our atmofphere were 518,385 toifes in height, we fhould have no light from the fun, even in his meridian. fplendour. It has been eftimated, that of the horizontal fun-beams pafling through about 200 miles of air, one two-thoufandth part only reaches us.
In all the inftances in which light is extinguifhed, it will doubtlefs be fo found that a certain quantity of heat will be generated. Sir Ifäac Newton feems perfectly aware of this fact. In his time, however, heat was fuppofed to arife from motion, and hence he concluded that the light, when it was neither reflected nor tranfmitted, fo acted upon the body it entered, as to put its particles into a vibutary motion, in which he believed the heat to confift.

Dr. s'Gravefande afferts, a lucid body to be, that which emits, or gives fire a motion in right lines; and makes the difference between light and heat to confift in this, that to produce the former, the fiery particles muft enter the eye in a rectilinear motion, which is not required in the latter: on the contrary, an irregular motion feems more proper for it, as appears from the rays coming dircetly from the fun to
the tops of mountains, which lave not near that effect withs thofe in the valley, agitated with an irregular motion, by feveral reflections.

Whether or not there be always light, where there is fire, has been difputed among authors; as alfo, whether or not there be any luminous body without heat ; heat being confidered by them as a motion that may be infinitely diminifhed, and light a matter that may be mininitely rare ; to which we may add, that no heat is fentible to us, unlefs it be more intenfe than that of our organs of fenfe. M. De Luc, in his Lettres Phyfiques et Morales, \&c. 1780 , obferves, that the rays of the fun, though not warm in themfelves, occafion heat, by giving activity to a fubltance, which refrdes in all bodies, and conititutes a part of their mafs, and which in certain circumflances is capable of producing heat: and that in confequence of this influence, this fubfance becomes an elaftic or igneous fluid. (See Heat.) Caloric, however, is now confidered material, and a diftinct fluid from that of light.

Solar heat is at prefent accounted for in a different way tothat of confidering the heat as extinguifhed light. Dr. Herfchel has, from a feries of experiments, of which we fhall foon give an account, concluded, that the rays of caloric, or rays \{olely producing heat, are emitted from the fun, as well as from terreftrial bodies, affording light and heat : while the rays of light, or fuch as are efliential to vifion and colour, have not the property of producing heat. How far this conclution is warranted, we flall have occafion hereafter to confider.

Befides the properties of light to be reflected and tranfmitted, and that of being ablorbed and extinguifhed, we are prefented with curious phenomena, arifing from the attraction between this fubflance and other matter, which is the caife of the refraction and infection of light. When a ray of light enters any tranfparent medium, in a direction perpendicular to the furface of the fame, the ray will maintain its courfe in the fame direction; but if the ray of light make any angle lefs than a right angle with the furface of the medium, it will not continue in the fame direftion, but will be drawn towards a ftraight line, perpendicular to the fame furface, and paffing through the medium at the point where the oblique ray enters. This line, in optical language, is called the perpendicular. The angle which the incident ray makes with the perpendicular is called the angle of incidence ? and the angle which the ray makes with the fame perpendicular, after it enters the medium, is called the angle of reo frafion. In all the degrees of obliquity at which a ray en. ters any medium, the tine of the angle of incidence has the fame ratid to the fine of the angle of refraction..

The refracting power of different tranfparent bodies is not dependent upon one property alone; it appears, however, to be directly as their denlity, all other things being equal.

Inflammable bodies are found to refract light much more than bodies not inflammable. Sir Ifaac Newton divided. diaphanous bodies into two claffes, each of which refract light as their denfity. The firft confifted of the inflammable, in which it was much more than according to the ratio of their denfity.

The other clafs, which were not inflammable, appeared to obey the fame law as to denfity, with the exception of thediamond and water. The formen of thefe refracked in the compound ratio of inflammability and denfity; and although: it was then not known to be inflammable, Newton ftrongly fufpected it to be entirely an inflammable body ; and that water which appeared to have an intermediate power bec tween the two claffes, he fuppofed, was partly inflammablo.

## LIGHT.

Thefe prophetic obfervations have been verified in the difcovery of the diamond being pure carbon, and in the decompofition of water.
The late difcoveries of Mr. Davy render it very probable that all compound bodies are compofed of inflammable matter and oxygen. Hence it would feem, that the refractive power of bodies is lefs in proportion to the oxygen they contain. Sir Ifaac Newton fulpected that refraction was caufed by inflammable matter alone, from which it would follow, that all diaphanous bodies contained inflammable matter. This, in all probability, is the cafe with the exception of oxygen. It has, however, been proved by M. Biot, that the refractive power of oxygen, although lefs than any fubftance in proportion to its denfity, is neverthelefs appreciable. The fame philofopher alfo afcertained that hydrogen refracts light in a ratio, independent of its denfity, higher than any other fubftance.

From the above facts we may, with fome certainty, conclude, that the refractive power of bodies, or, in other words, their attraction for light, is in the compound ratio of their inflammability and denfity.

Light is not only attracted in paffing through different media, conftituting refraction, but it is attracted towards the fides of bodies by which it paffes, and is then faid to be inflected. When a beam of light is let through a fmall hole into a darl room, the rays are found to be drawa towards the fides of the hole, by which means they acquire a certain degree of divergence. In confequence of this change in the direction of the rays, the fhadows of hairs, and other flender fubflances held in the beam of light coming through the aperture, are found to become eularged in proportion to the diflance of the place on which the fhadow is caft. See Inflection.
From this circumftance fir Ifaac Newton concluded, that the rays of light mult have pafled as they are reprefented in Plate IX. Optics, fig. 8. in which X reprefents a fection of the hair, and AD, BE, \&c. rays of light paffing by at different diftances, and then falling upon the wall $Q Q$. Since, when the paper which receives the rays is at a great ditance from the hair, the fhadow is broad, it muft follow, as he obferves, that the hair acts upon the rays of light at fome confiderable diftance from it ; the action being ftrongett on thofe rays which are at the lealt diftance, and growing weaker and weaker on thofe which are farther off, as is reprefented in the figure; and from hence it comes to pafs, that the fladow of the hair is much broader in proportion to the diltance of the paper from the hair, when it is nearer than when it is at a great diftance. It is of no moment, whether the hair be furrounded with air, or with any other pellucid fubftance. The fhadows of fcratches made in polifhed plates of glafs, and the veins in the giafs, caft the like broad fhadows; fo that the breadth of fhadow muft proceed from fome other caufe than the refraction of the air.

The fhadows of all bodies, metals, ftones, glafs, wood, horn, $\& \mathrm{c}$. in this light, were bordered with three paralle fringes, or bands of coloured light, whereof that which was contiguous to the fladow was the broadelt and moft luminous, while that which was the moit remote was the narroweft, and fo faint, as not eafily to be vifible. The firt or innermoft fringe was violet, and deep blue next the thadow, light blue, green, and yellow in the middle, and red without. The fecond fringe was almoft contiguous to the firt, and the third to the fecond; and both were blue within, and yellow and red without; but their colours were very faint, efpecially thofe of the third. The colours, therefore, proceeded in the following order from the fhadow: relvet, indigo, pale blue, green, yellow, red; blue, yellow,
red : pale blue, pale yellow, and red. The fhadows made by fcratches and bubbles in polimed plates of glafs, were bordered with the like fringes of coloured light. He alfo obferves, that by looking on the fun through a feather, or black ribbon, held clofe to the eye, feveral rainbows will appear, the fladows which the fibres or threads calt on the retina being bordered with the like fringes of cow lours.

From comparing other experiments, in which a ray of light was made to pafs through a hole into a darkened chamber, and then through a hole in a pafte-board, firlt by the edge of a fingle knife, and then by the edges of two knives placed parallel to one another, fir Ifaac Newton concluded, that the light of the firft fringe paffed by the edge of the knife at a ditance greater than the eight hundredth part of an inch, that the light of the fecond fringe paffed by the edge of the knife at a greater diltance than the light of the firtt fringe, and that of the third at a greater diftance than that of the fecond; and that the light, of which the Atreams, obferved in thefe experiments, conifited, paffed by the edges of the knives at lefs diltances than that of any of the fringes.
In another experiment, he placed at the hole a prifm to rcfract the light, and to form, on the oppofite wall, the coloured image of the fun; and he found that the fhadows of all bodies, held in the coloured light between the prifin and the wall, were bordered with fringes, of the colour of that light in which they were held; and comparing the fringes made in the feveral coloured lights, he found, that thofe made in the red light were the largett, thofe made in the violet the leaft, and thofe made in the green were of a middle fize. Whence he inferred, that the rays which made the fringes in the red light, paffed by the hair at a greater diftance than thofe which made the like fringes in the violet; fo that the hair, in caufing thefe fringes, aated alike upon the red light, or leaft refrangible rays, at a greater diftance, and upon the violet or molt refrangible rays at a lefs diltance, and thereby occafioned fringes of different fizes, without any change in the colour of any fort of light. It may, therefore, be concluded, that when the hair in the firlt obfervation was held in the white beams of the fun's light, and calt a fhadow, which was bordered with three fringes of coloured light, thote colours arofe not from any new modificatious impreffed upon the rays of light by the hair, but only from the various inflections, whereby the feveral forts of rays were feparated from one another, which, before feparation, by the mixture of all their colours, compofed the white beam of the fun's light ; but when feparated compofed lights of the feveral colours which they are originally difpofed to exhibit. But for a fuller account of the author's curious experiments, and the conclutions drawn from them with regard to the inflection of light, we muft refer to his well known treatife on Optics, p. 293. \&c.

This attion of bodies on light is found to exert itfelf at a fenfible diftance, though it always increafes as the diftance is diminifhed; as appears very fenfibly in the paffage of a ray between the edges of two thin planes at different apertures; in which there is fomething very peculiar; the attraction of one edge being increafed as the other is brought nearer it. The rays of light, in their paffage out of glafs into vacuum, are not only inflected towards the glafs, but, if they fall too obliquely, they will revert back again to the glafs, and be totally reflected.

The caufe of which reflection camot be attributed to any refiftance of the vacuum, but mult be entirely owing to fome force or power in the glafs, which attracts or draws back the rays as they are paffing into the vacuum. And

## LIGHT.

this appears farther from hence, that if you wet the pofterior furface of the glafs with water, oil, honey, or a folution of quickfilver, then the rays which would otherwife have been reflected, will pafs inte and through that liquor; which fhews that the rays are not reflected till they come to the polterior furface of the glafs, nor even till they begin to go out of it; for if at their going out, they fall into any of the forefaid mediums, they will not then be reflected, but perfift in their former courfe, the attraction of the glafs being in this cafe counterbalanced by that of the liquor.
Experiments, fimilar to thofe of fir Ifaac Newton on inflected light, were profecuted by M. Maraldi, whofe obfervations chiefly refpect the inflection of light towards other bodies, whereby their fhadows are partially illuminated. Ac. Paris, 1723. M. p. 159. For an abtract, fee Prieftley's Hittory, \&c. of Light, \&c. p. 521, \&c. M. Mairan, without attempting the difcovery of new facts, endeavoured to explain the old ones, by the hypothefis of an atmofphere furrounding all bodies; and confequently making two reflections and refractions of light that impinges upon them, one at the furface of the atmorphere, and the other at that of the body itfelf. This atmolphere he fuppofed to be of a variable denfity, and refractive power, like the air. M. du Tour fucceeded Mairan, and imagined, that he could account for all the phenomena by the help of an atmofphere of an uniform denfity, and of a lefs refrac. tive power than the air, furrounding all bodies. Du Tout varied the Newtonian experiments, and difcovered in the colours produced by the inflection of light more than three fringes, which he exhibited diftinctly in the following manner. He took a circular board, A B E D (Plate IX. Optics, ffg. 9.) thirteen inchies in diameter, the furface of which was black, except at the edge, where there was a ring of white paper, about three lines broad, in order to trace the circumference of a circle, divided into 360 degrees, beginning at the point A, and reckoning 180 degrees on each hand to the point $\mathrm{E} ; \mathrm{B}$ and D being each of them placed at 90 degrees. A flip of parchment three inches broad, and difpofed in the form of a hoop, was fattened round the board, and pierced at the point E with a fquare hole, each fide being four or five lines, in order to introduce a ray of the fun's light. Laftly, in the centre of the board C, and perpendicular to it, he fixed a pin, about one-third of a line in diameter.

This hoop being fo difpofed, that a ray of light entering the dark chamber, through a vertical cleft of two lines and a half in length, and about as wide as the diameter of the pin, went through the hole at E , and pafing parallel to the plane of the board, projected the image of the fun and fhadow of the pin at A.

In thefe circumiltances he obferved, 1 it, that quite round the concave furface of this hoop, there was a multitude of coloured Atreaks; but that the fpace $m A^{\prime} n$, of about eighteen degrees, the middle of which was occupied by the image of the fun, was covered with a faint light only.
2. The order of the colours in thefe ftreaks was generally fuch, that the molt refrangible rays were the nearelt to the incident ray ECA; fo that, beginning from the point A, the violet was the firft, and the red the lait colour in each of the Atreaks. In fome of them, however, the colours were difpofed in a contrary order.
3. The image of the fun, projected on each fide of the point A, was divided by the fhadow of the pin, which was bordered by two luminous ftreaks.
4. The coloured Itreaks were narrower in fome parts of
the hoop than others, and generally decreafed in breadth in receding from the point $A$.
5. Among thefe coloured fraks, there were fometimes others which were white, a line, or a line and a half in breadth, which were always bordered on both fides by a ftreak of orange colour, at leait when the light of the fun was intenfe, and the chamber fufficiently dark.

From this experiment he thought it was evident, that the rays which paffed beyond the pin were not the only ones that were decompofed; for that thofe which ąre refleged back from the pin were decompofed alfo: from which he concluded that they mult have undergone fome refraction. He alfo thought that thofe which went beyond the pin fufo fered a reflection, fo that they were all affected in a fimilar manner.

In order to account for thefe facts, our author defcribes the progrefs of a ray of light through an uniform atmo. fphere which he fuppofes to furround the pin, and fhews that the differently refrangible rays will be feparated at their emergence from it; but he refers to fome experiments and obfervations in a future memoir, to demonftrate that all the coloured flteaks are produced by rays that are both reflected and refracted. Memoires Prefentés, vol. v. p. 636. 641.

From other obfervations, M. Du Tour concludes, that the refracting atmofpheres, furrounding all kinds of bodies, are of the fame fize; for when he placed a great variety of fubftances, and of different fizes allo, he always found the coloured flreaks of the fame dimenfions. He allo obferves, that this hypothefis contradiets an'obfervation of fir Iface Newton, viz. that thofe rays which pafs the neareft to any body are moft inflected. Mem. de Mathem. and de Phyf. vol. v. p. 650, \&c. or Prieflley, ubi fupra, p. 531, \&c.
M. Le Cat found that, in fome cafes, objects appear magnified by means of the inflection of light. Looking at a diftant fteeple, when a wire of lefs diameter than the pupil of his eye was held pretty near to it, and drawing it feveral times betwixt his eye and that object, he was furprifed to find that, every time the wire pafled before his pupil, the fleeple feemed to change its place, and fome hills beyond the fteeple feemed to have the fame motion, juft as if a lens had been drawn betwixt his eye and them. This difcovery led him to feveral others depending upon the inflection of the rays of light. Thus, he magnified fmall objects, as the head of a pin, by looking at them through a fmall hole in a card; fo that the rays which formed the image, mult neceffarily pafs fo near the circumference of the hole, as to be attracted by it : he alfo exhibited other appearances of a fimilar nature. Traité des Sens, p. 299, \&c. Prieftley, ubi fupra, p. 537, \&c.

Several coincident facts induced fir Ifaac Newton to believe that reflection, refraction, and inflection refulted from the fame caufe, namely, attraction: Of the two latter of thefe properties refulting from this caufe there can be little doubt; , but the laws by which the firft is governed appears to depend rather upon the repulfion than the attraction of the medium. The greateft myttery attending reflection, is in the circumftance of the under furface reflecting light equally with the upper furface. This part certainly goes far to prove, that the reffection of light is not to be explained by confidering the reflecting furface as a hard fubtance, from which the elaftic particies of light are repelled, particularly fince the reflection from the under furface of any medium is in the inverfe ratio of the denfity of the medium, beyond the reflecting furface, and is greatelt when the furface is bounded by a vacuum.

Although

## LIG.HT.

Although fir Iface Newton does not attempt to explain the reflection from the upper furface by the attraction of the medium, he feems to be of opinion, that the light reslected from the under furface is attracted by the fame medium in a contrary dircction.

Hence be concludes, that this reffection is lefs as the denfity of the under medium is greater, the attraction of the firlk medium being counteracted by that of the fecond.

This explanation does not appear fatisfactory. If the reflection of the rays from the under furface depended upon the attraction of the fame medium, it would not produce the fame phenomena which refult from the reflection at the upper furface, and which is clearly caufed by fomething like repulfion.

When a ray of light falls upon any reflecting furface, we cannot for a moment fuppofe that any attraction of the medium could caufe it to be reflected, fince the effect produced can arife only from a repellent force, exerted in a direction perpendicularly from the furface of the body. And that the elaftic force exifting between the body and the light is fo perfect, as to make the angle of reflection equal to the angle of incidence. Newton very properly argued, that the reflection could not take place from the particles of light ftriking the hard parts of bodies, on account of the numerous interfices exifting between their molecules; on the contrary, he fuppofed the light which ftruck the folid parts became extinguifhed.

It may here be obferved, that it is equally difficult to explain the action of one folid body upon another, as it may eafily be proved that they do not come into abrolute contact in any initance.

When we attempt to unite the furfaces of fractured bodies, we cannot, in moft inftances, bring the parts within the fphere of attraction; and even where this can be effected, as in two bright furfazes of lead, it may be proved that the parts do not touch.

It feems difficult to conceive how an atmofphere of hy* drogen fhould by its preflure fupport a column of mercury, by the mere action of the folid patts of the two furfaces, fince every particle of hydrogen would be required to act upon 2700 particles of mercury.

We may, without nuch gratuity, confider all folid bodies as compounded of two fpecies of matter; the one poffefing fo great an attraction as to bring the particles into abfolute contact, and the other fo completely repellent of itfelf, as to be infinitely diffipated, if it were rot for its attraction for matter with which it combined. The former of thefe properties is peculiar to all ponderable matter, the latter to the repellent matter denominated light and caloric, and perhaps electricity and magnetifm. Daily experience fhews, that the conftitution of folid and liquid bodies is dependent upon a certain quantity of caloric, oppofed to the oppofite and contending force of the attraction of the particles of the folid body, by which alfo their volumes and relative gravities are governed. Hence we may expect, that when the attraction of the body for caloric is greater than the repellent force of the caloric, the body will pollefs whiat is called a greater capacity for heat, and the reverfe of this will take place from a conrary change.

Conceiving the above to be the cafe, it will be eafy to infer, that the furfaces of bodies mult be furrounded by atmofpheres of caloric, and it doubtlefs is by thefe atmoSpheres that we are to account for the difficulty of bringing two furfaces together, and by which we may alfo explain the action of the hydrogenous atmofphere upon the mercury. May not we, therefore, draw this general con-
clufion, that the particles of all folid matter can never be brought into contact, eifher in their internal arrangement or on the furfaces; and that the repulfion exifting between the particles of bodies, whether in the fame or in two different bodies, is folely to be attributed to the repulfion be-tween the particles of caloric? And may we not further conclude, that the particlès of hodies, in all fituations, and under all circumftances, are conftantly exerting an attra\&ive force tending to their ulimate contact ? If it fhould be admitted that caloric is the caufe of repulfion, elafticity mult be therefore dependent upon its prefence, acting in a contrary direction to the attractive force. Hence it would be very abfurd to fay that caloric itfelf fhould be elattic, becaufe this property depends upon two forces. When caloric, therefore, is reflected from the furface of a body, we are to attribute its return to the repulion between itfelf and the caloric of the body, the folid matter having nothing to do with the reflection. The rays of caloric, paffing from one body to another, may, from what has been obferved, be caufed by the joint action of two forces. The one arifing from the repulfion of the particles of caloric for each other at the heated body, and the other from the foliciting force of the attraction between the caloric and the receiving body. When, however, the repulfion between the radiant caloric and the caloric of the receiving body increafes in a greater ratio. than their attraction, the radiant caloric will be reflected. A contrary effect would caufe them to be abforbed.

When the direction of the radiant caloric is perpendicular to the receiving furface, its projectile force confpires in the greateft degree with the attraction of the body, and lefs of courfe in proportion to its obliquity. Does not this agree with the eitablifhed fact, that the reflection of both. light and heat is inverfely as the angle of obliquity the ray makes with the furface.

Light and caloric, fo far as their reflec ion is concerned, are fo fimilar, that we may with great propriety apply the fame reafoning to the reflection of light, and the fame abfurdity would arife in confidering light as confifting of elaftic particles, becaufe this would imply the exiftence of attractive matter in its compofition. When, therefore, light is reflected, we are to confider with fir Ifaac Newton, that no action takes place between the particles of light and the folid matter to produce the effect ; but, agreeably to our liypothefis, we mult conclude that the reflection is caufed by the repullion between the particles of light and the caloric of the body.

If the reflection is caufed by the calorific atmofphere on the furface of the body, we may perceive an eafy way of explaining why the reflection of light is confined to the furface of bodies, and why the under furface fhould reflect as much as the upper one.

This hypothetis does not difagree with the fact, of the reflection being, like the refraction, as the denfity of the, medium, becaufe the increafe of denfity will be attended with increafe of attraction between the particles, and it will be evident, that the denfity of the calorific atmofphere will be in the fame proportion, therefore reflection will be as the denfity.

What we obferved refpecting the obliquity of the rays of caloric, will hold good with refpect to light. When the obliquity of rays of light, which fall upon tranfparent bodies is fuch, that the repulion between the light and the caloric of the body is greater than the projectile force of the ray added to the attraction, the medium of the angle of obliquity is called the angle of total reflection. When the refection is from the under furface, the attraction of the

## LIGHT.

medium confires with the repulfion between the light and the caloric atmofphere to caufe total reficetion, and the angle of total refection ought to be rather greater at the under than the upper furface, which has been faid to be the cafe; at leaft it has been obferved by louguer, that more light is reflected from the internal than the external furface. The additional force given by the attraction of the medium to caufe the internal reflection, will be counterafted by any other medium beyond this furface, and this accounts for the tranfmiffion under fuch circumitances. Agreably to the eftablifhed notion, therefore, we hold, that refraction and inflection are caufed by the attraction exilting between the light and the body. But it is more conliftent with our views, to confider reflection and tranfmiffion as being caufed by the repulfion exilting between the particles of light, and between light and the calorific atmofphere of the body, modified and altered under certain circumitances, by the attraction between light and the medium.

Were we only acquainted with the fact, that light was attracted by ponderable matter, we fhould, from our knowledge of gravity, conclude that the refraction would be as the denfity of the medium; and we are not fo much furprifed at the circumitance of light being more attracted by inflammable than other bodies, when we recollect the great quantity of light and heat furnifhed by thofe bodies, when they combine with oxygen; and at the fame time remember that the attraction of one body for another is as the quantity with which it can combine.

Some very curious facts relative to the properties of light have lately been difcovered by M. Malus. (See Memoires de la Société d'Arcueil, vol. ii. p. I43.) It appears from the refearches of this philofopher, that light is changed in its properties by particular reflection. If, fays he, we take two plates of glafs, and let two of their furfaces make an angle of $70^{\circ} 50^{\circ}$; then imagine a line which thall bifect this angle. Any ray of light falling upon one of thefe furfaces, in a direction parallel to the above bifectiag line, will be reflected to the other. The light, however, is fo changed in its properties by the firft reflection, as to be completely unfufceptible of being reflected from the fecond furface; but the whole of it will be tranfmitted. This new property of light has been applied, with fome fuccefs, to explain the nyyterious phenomenon of double images formed by the Iceland cryftal, calcareous fpar, \&c. If it be alked, how it happens, fince we afcribe the reflection of the rays to the action of the whole furface of the body without contact, that all the rays are not reflected from every furface; but while fome are reflected, others pafs through, and are refracted? The anfwer given by fir Ifaac Newton is as fol. lows:-Every ray of light, in its paffage through any refracting furface. is put into a certain tranfient conflitution or fate, which in the progrefs of the ray returns at equal intervals, and difpofes the ray at every return to be eafily tranfmitted through the next refracting furface, and between the returns to be eafily reflected by it; which alternation of reflection and tranfmiffion appears to be propagated from every furface and to all diftances. What kind of action or difpofition this is, and whether it confilts in a circulating or vibrating motion of the ray, or the medium, or fomewhat elfe, he does not inquire; but allows thofe who are fond of hypothefes to fuppoie, that the rays of light, by impinging on any reflecting or refracting furface, excite vibrations in the reflecting or refracting medium, and by that means agitate the folid parts of the body. Thefe vibrations, thus propagated in the medium, move falter than the rays, fo as to overtake them; and when any ray is in that part of the ribration which confpires with ite motion, its velocity is in-

Vol. XX.
crcafed, fo that it cafily breaks through a refraching furface; but when it is in a cmetrary part of the vibration, which imspedes its motion, it is eafily reflected; and confequently, that every ray is fucceffively difpofed to be cafily reflected, or tranfmitted by every vibration which overtakes it. The returns of which difpofition of any ray to be refected, he calls fits of cafy rgfiction; and thofe of its difpofition th be tranfmitted, he calls fits of cafy tranfmiffion; and the fpace between the returns, the intervals of the fits. Thic reaton, then, why the furfaces of all thick tranfparent bodies reflect part of the light incident on them, and refrakt the refl, is that fome rays in their incidence are in fits of ealy reflection. and others of eafy tranfinifion. Sce Replection, Ru: fraction, and Optics.
Having given fome idea of the nature of light in gencral, we fhall next point out the different fources of light; and under each of thefe heads, detail its more partictular properties as a chemical agent, and its connection with the matter of heat.
Solar Lishtt. - We have already fated the immenfe velocity with which light is emitted from the fun's body; and it will be eafy to conceive that it cannot fuffer any change in velocity or dircction, till it meets with fome ponderable matter. In approaching any p'anetary body, fuch as our earth, we have reafon to believe that they are mutually attratied. Rays falling perpendicularly upon the aimofphere are equally attratted on every fide, and come in a ftraight line to the earth; while thofe rays which fall obliquely are bent out of their original direction; and fance the atmoSphere is not of uniform denfity, fuch oblique rays will come to the earth in curved lines. If our atmofphere were of aniform denfity, the refraction would not be altered; but the oblique rays falling upon its furface, would be reflected in a very great degree; a circumftance which would deprive us of much of the fun's light. . No doubt a great quantity of light becomes extinguifhed in its paflage through the aerial medium, as we may juftly learn from the difference of intenfity in the light, at different altitudes of the fun; but how much mult this lofs of light appear, when we recur to the Itatement already made, namely, that the whole effect of the fun's light would be loft by pafling through 679 feet of feawater, and that the fame effect would take place by its paffage through 3,110,310 feet of air.
The following is a table from M. Bouguer, fhewing the intenfity of the fun's light, at different altitudes, and the thicknefs of air it has to penetrate ar each angle.

The property of light to be refracted had been known long before the time of Newton; but this philofopher was the firft who difcovered that the light of a fun-team was not refracted uniformly. If light were uniformly refracted, the rays which enter any plane furface would retain their relative inclination to each other, while they pafa through the diaphanous medium; and the fame after their emergence, if the furface were a plain. Sir Ifaac Newton, however, has proved, by a feries of elegant experiments, Arengthened by
able reafoning, that the different parts of a folar beam are not refracted in the fame degree. He caufed a beam of light to pafs through a fmall hole in the window-fhutter of a dark room, making the pencil of rays to fall upon one fide of a triangular priim. Thefe rays were fo refracted as to come out at another fide of the prifim. Thefe emergent rays, however, were not parallel as they entercd the other fide ; but each made a certain angle with the other, in confequence of fome being more bent or refracted than the other. The image, or fpectrum, formed by thefe rays upon a thee of white paper, infead of being round, which would have refulted from uniform refraction, was of an oblong fhape. Thofe rays which had been the leaft refracted occupied one end of the fpectrum; and thofe moft refracted, the other. The former tinged the paper of a red colour, the latter a violet colour ; the intermediate rays exhibiting different colours, which were in the following order: red, orange, yellow, green, blue, indigo, and vioket.

In order to fhew that each of thefe rays had fpecific properties, not depending upon the medium they paffed through, he caufed them to pals through a fecond prifm, fometimes together, and fometimes feparately; but he always found them to retain their original properties.

By means of two contiguous fpectrums, he caufed a ray of one colour in the one to unite with a different colour int the other, and produced different compound colours. The yellow of one with the red of the other produced orange, which had the appearance of the primitive orange ray, and differed from it only in being decompofable into its original elements.

He afcertained by direct experiment, that thofe rays which were moft refrangible were alfo molt reflexible. In confequence of this property, he could reflect the different. coloured rays feparately. He caufed the light to fall upon a prifm, fo laid upon a fimilar prifm as to conflitute a parailelopiped, fo that the rays were parallel at their emergence ; but upon turning the two prifms round their common centre, the light became reflected from the upper contiguous furface, and all the rays in their turns arrived at the angle of total reflection. But he obferved that thofe which had been moft refracted were firft reflected; the leaft refrangible being the laft.
Thefe valuable facts were ufed by this able philofopher to explain the colours of natural bodes. He has fhewn that colour is not a fpecific property of bodies, but is caufed by the different rays of light being reflected from the furface of the body; the reft of the rays paffing into, or through the body. Since the time of this philofopher, it has been objected, that the feven colours above mentioned are not primitive. It feemis very obvious that there can be oily thriee primitive colours, namely, red, yellow, and blue; fince all the colours can be made by means of thefe. It has lately been advanced by Prieur, that the primitive colours are violet, green, and red: that the yellow is formed with red and green, the latter being in excefs; and that when the red is in excefs, they form orange; the green and violet form bluc.

The colours excited by the different refrangible rays do' not appear to determine what are the primitive colours, fince we find that different rays are capable of producing the fame colour, as a mixture of the jellow with the red produces orange. And it mult be admitted, that the violet, rays excite, in fome degree, the idea of red along with the blue; as in the green, the yellow and blue may be dif. cerned, but none of the red.
When the different coloured rays are mixed together, either by recompofition, or by getting each colour from a

## I. I G H T.

£eparate fpectrum, the refult will be white light. Hence fir Ifaac Newton concluded, that when the rays are promifcuoufly reflected from any furface it will appear white. It was found by fir Ifaac Newton, and has fince been confirmed by the experiments of Dr. Herfchel, that the different coloured rays have not by any means the fame illuminating power. The violet rays appear to have the leaft luminous effect, the indigo more, the blue a little more, the green very great, between the green and the ycllow the greatelt of all, the yellow the fame as the green, and the red lefs than the yellow. Whien the folar rays are paffed through a convex lens, or reflected from a concave, a very intenfe heat is produced by the concentration of the rays. Count Rumford has fhewn, that when the rays of the fun are made to pafs through a certain aperture, and fall aıpon any fubtance to be heated, white the fame area of light is made to pafs through a lens, in the focus of which the fame quantity of matter is to be heated, they become heated in the fame time to the fame degree. Nothing is better known, in fhort, than that the rays of the fun are capable of exciting fenfible heat. Newton, and the philofophers of his age, accounted for heat by the motion excited in the parts of the body by the agitating power of the abforbed light. Melville fuppofed that the heat was expelled from the terreftrial matter by the light. At prefent, it is generally admitted, on the ftrength of fome valuable experiments made by Dr. Herfchel, that the rays of light and caloric are feparately emitted from the fun, the luminous rays producing light, and the calorific, heat.
This philofopher introduced a beam of light into a dark room, which was decompoled by a prifm, and then expoled a very fenfible thermometer to all the rays in fucceffion, and obferved the heights to which it rofe in a given time. He thus determined, that the heating power of the red to that of the green rays was $2 \frac{3}{4}$ to 1 , and $3 \frac{1}{2}$ to I in red to violet.

On repeating thefe experiments, he found that the greatef quantity of calorific rays were, even bejond the coloured fpectrum at about $\frac{1}{2}$ an inch, from the commencement of the red rays. At a greater diftance from this point it began to diminifh, but was vers perceptible even at the diftance of $1 \frac{1}{2}$ inch.
It will appear from what has been ftated, that thefe caIorific rays are lefs refrangible than the rays of light; hence the calorific focus will fall beyond that of the luminous. Dr. Herfchel made an experiment to verify this inference, but did not come at any thing very conclufive. He afterwards made experiments to collect thefe invifible calorific rays, and caufed them to at independently of the light, by which he concludes, that they are fufficient to account for all the effects produced by the folar rays in exciting heat; that they are capable of pafling through glafs, and of being refracted and reflected, after they have been finally detached from the folar beam.

If we are to confider thefe invifible rays as being truly the fame with artificial heat, emanated from terreftrial bodies, under the temperature of $800^{\circ}$ of Fahrenheit, fome of the experiments of Dr. Herfchel are ftrongly at variance with fome of the experiments of Mr. Lefley, detailed in his work, entitled "An Enquiry into the Nature of Heat,"? efpecially fo far as relates to the tranfmiffion of heat through tranfparent bodies. It appears from the facts given by Mr. Lefley, that the heat of 212 of Fahrenheit is not tranfmitted by glafs in the radiant form, but is firlt abforbed by the glafs, and radiated afrefh from its oppofite furface. He was led to this conclution by the faet, that more heat paffed through whinte paper than the glafs. And what "ill more confirms this idea, he found equally as such heat paffed through two plates of tin, one fide of
each being blacked, and the other polifhed. When the bright fides were placed together, and the black outwards, it tranfmitted as much as the glafs; but when the black fides were together, and the bright fides outward, there was no perceptible quantity pafled through.

That culinary heat does not pafs direetly through glafs, may be tried by holding a pane of glafs hefore a heated body, and alternately holding the hand on each fide the glafs. After fome time, however, the glafs gives heat to the hand, proving that the heat has been tranfmitted; but this will be found to refult from a fecond radiation, and would have been more aburdant, if a plate of metal, painted black, had been in the place of the glafs.

The heat from the fun's rays is not fo affected. It requires no perceptible time to pafs through feveral thick prifms of glafs, and when we hold a convex lens in the fun's beams, we have inftantaneous heat produced upon any opaque body in iţ̦ focus.

We have not yet fufficient ground to eftablifh the iden. tity of light and heat; but if Dr. Herichel's experiments be correct, we muft either conclude that the folar calorific rays are of a different nature from the invifiblerays, or that folar light is converted into caloric from heated bodies. The fame philofopher, however, has made the fame experiments with invifible culinary heat, and with fimilar refults. How fhall we reconcile the feeming contradictions? Dr. Herfchel ufed two thermometers, one of which was his Randard. Mr. Lefley ufed the differential thermometer, an elegant inftrument, invented by himfelf. Dr. Herfchel began his experiments with a red-hot cylinder; and continued them till it became invifibly cold. 'Mr. Lefley ufed a cannitter filled with boiling water. A more particular fet of experiments is till wanting to clear up this myfterious fubject.

Dr. Herfchel has allo given us fome ufeful experimental facts on the relative quantities of light and heat tranfmitted by different fubitances. The following Table fhews the quantity of light and heat, ftopped by colourlefs and tranfparent folid fubitances.

Table V.
Shewing the Aloppage of rays of flane, fire, and invifible rays from a flove.

The experiments in the firft, fecond, and third tables, were made by letting the fun's rays act directly upon one thermometer, while the fame light acted upon another after paffing the different fubitances. ${ }^{\circ}$ The numbers in the tables are the ratios of the differences of the degrees of each, after being acted upon for a given time. Table IV. was made in the fame way, the red rays and the invifible rays being each feparated by the prifm, making two fets of experiments. In each of thefe, the red, or the invifible, acted on one thermometer, and on the other through each of the fubftances.

Table V. is formed from three fets of experiments, made at different times, by caufing, in the firft, the rays of the flame of a candle to act upon one thermometer directly, and upon the other through the fubitances. In the fecond fet the rays of a common fire were ufed; and in the third, the invifible rays of an iron ftove. See Phil. Tranf, for 1800.

An abundance of ufeful knowledge is to be derived from thefe refearches, which may be of the utmoft imp irtance to fociety, as well as in giving aid to different branches of fcience.

In delicate experiments of this kind, the thermometer feems to be the molt important of the apparatus. The fmallnefs of the fcale, and the want of fenlibility in thofe ufed by our ingenious experimenter, were certainly very objectionable, when compared with the differential thermometer of Lefley. A repetition of thefe experimients, under
fuch an advantare, is highly to be recommended. We have already pointed out fome contradictions between thefe and Lefley's experiments.

By comparing the effect of the fubitances upon the folar invirible rays in Table IV, and upon the invilible rays from the iron flove in Table V., we are led to fome very fingular conclufions. It appears, for inttance, that flint-glafs itops none of the invifible rays of the feectrum, although the fame fubltarce ftops 143 out of 1000 of the red rays, 91 of 1000 of direct folar heat, 34 of the direct light. Hence it would feem that calurific rays mixed with the luminous, mult conflitute the gi of sooo, lince all the invifible rays pafs through. We mult from thefe data conclude, that either the light of the folar fpectrum produces heat, or that the calorific part in the coloured rays is of a different nature from the invifible calorific rays. If the latter be admitted, we have as much reafon to conlider the folar beam as confiling of different kinds of heat, as well as of light.

Thefe anomalies are itill increafed, when we turn to Table V., where we find that the fame flint-glafs stops out of 1000 rays 730 invilible rays from a ftove, which would feem to eltablifh that this calorilic matter is fill different from both the vifibie and invilible caloric of the fun; and in the experiments of Mr. Lefley, caloric appears to poffefs fitll very different properties.

We here fee fo much myflery and contradiction, that we mult wait for more particular refearch. It is unlike the fimplicity of nature; the fault mult, therefore, reft with the philofophers.

Sir Ifaac Newto., on finding fo many different fpecies of light, was unwilling to make to many Auids, but fuppofed they differed in the fize of their particles; the largeft being the lealt refrangible, and the fmalleft the molt. The fame thing would take place from the fame particles moving with different velocities; the moft refrangible moving with the lealt, and the lealt refrangible with the greateft velocity.

We have already ftated. a fact difcovered recently by Malus, that light acquires new properties by a peculiar reflection. Does it then appear impoffible that it flould not be changed in paffing through diaphanous media? May not that which moves with the greateft velocity have a greater portion converted into heat; or, in other words, may not this converfion be as the velocity? This idea is flengthened, from the circumftance of calorific rays being found thronghout the fpectrum. The greatelt objections raifed to this idea of light and heat being excited by the fame rays moving with different velocities, are founded on the facts of combined light in phofphorefeent bodies, and in the chemical effects which were thought to be peculiar to light. In our next fubject, however, we fhall thes that all the chemical effects producible by light can be produced by heat.

Belides the propertics of the folar beams to produce heat and light, we find it to have other properties eqnally important to the animated world. This is molt confpicuous in the economy of vegetables. It has been many times proved, that vegetables, growing without light, would not, in the firlt place, have more tendency to grow up wards than in any other direction. This arifes from an evident attraction exifting between light and living vegetables: This fact is familiar to thoie who have placed trees in windows. It is obfervable, that they always lean towards the light. The fame effect would doubtlefs take place, if one fide of a vegetable were fhaded in the open air. The attraction of light is probably not the fame for different vegetables; by which we may account for the different forms of trees. 'I'his is rendered plaulible, when we contralt the fpreading
branches of the oak with the enwering branches of the poplar.
Experience has long aon elfablined, that vegetables become deltitute of fmell and colour, and lofe much of their combutibility, by growing in the dark. We find in Dr. Bhack's lectures, an account given by the celebrated Dr. Kobinfon of Edinburgh In the drain of a conl-work under ground, he accidentally laid his hand upon a very luxuriant plant, with large indented foliage, and perfectly white. He had not feen any thing like it, nor could any one inform him what it was. He had the plant with a fod brought into the open air in the light. In a little time the lenves withered, and foon after new leaves began to fpring up, of a green colour, and of a dififerent thape from that of the old ones. On rubbing one of the leaves between his lingers, he found that it had the imell of cummon tanfy, and ultimately proved to be that plant, which had been fo changed by growing in the dark. Indeed it was recollected that fome foil had been taken into the drain from a neighbouring garden, fome time before it was found fo altered.

This effect of light is not lefs confpienous in the growth of celery. By covering it with earth, the light is thut out, which would very foon turn it green, and make its flavour, fo ftrong as to render it unlit to be eaten, at the fume time that it would render it more fibrous and tenacious.

From the circumitance of light giving odoar and inflammability to vegetables, and fince thefe properties are molt common to budies containing hydrogen, it would appear that light was effential to the production of hydrogen, perhaps by expelling oxygen; and hence it would alfo appear that hydrogen is neceflary to the colour of vegetables. It has been afferted by Humboldt, that he found verctables growing in the dark mine, having their natural colour, but thefe plants were inveloped by hydrogen.

Light is found to produce various chemical changes upon bodies. When the oxyd of filver is precipitated from nitric acid by muriatic acid, the infoluble muriat is at firit white, and if kept in the dark at the common temperature, would doubilefs remain fo for an indefinite length of time. If, however, it be expofed to the light for a little time, it begins to aflume a purple colour, and ultimately becomes black. This effect takes place more rapidly according to the intenlity of the light. Hence it has been propoled to meafure the intenfity of light by the time of its changing. Aus inftrument has been invented for this purpofe by Mr. Lefley. Sce Photometer.

The general eifect of lighit, as a chemical arent, appears to confilt in difengaging the oxygen, or an acid from bodies which it effers, no doubt, by teffening the affinity of the bafe for oxygen, or the faliive bafe for the acid. Hence, we fiua light is capable of decompoling thofe oxyds and falts, in which the oxygen or acid is bell by a weak aftinity. It therefore detaches oxygen from the oxyds of gold, platina, filver, and the peroxyd of lead: alfo from nitric and liquid oxymuriatic acid. Dr. Herfchel, in his experiments upon light, finding that the folar fpectrum had different illuminating powers in different parts, conjectured that the power of the fun's light to effect chemical changes, might principally belong to fome particular part of the Spectrum, and it appears that this ingenious hint has been confirmed by experiments made by Dr. Woollatton, and alfo by Ritter. It appears that the invifible rays have no action upon the muriat of filver, the red rays a little more, and fo on, increafing to the utmolt boundary of the violet. ray; but the maximum of effect was found at forne diftance beyond the violet. It appears, therefore ${ }_{2}$ from this curious

## LIGHT.

fact, that the folar beam confits of rays which have three diltinct effects, one producing light, another heat, and a third prodacing neither, but which effect the greatelt chemical changes in the leaft time.
Some experiments lately made by Guy Luffac and Thenard, and detailed in their work entitled " Recherches Phyfiques-Chimiques," vol. ii. p. 186, go far to prove that the chemical changes produced by the folar rays are not dependent upon any fpecific property of light, as they have produced limilar effects by heat alone. Dry oxymuriatic acid gas was not decompofed by light nor heat. Liquid oxymuriatic acid was decompofed by a light not Arong, and by a heat equal to obfcure red. Nitric acid by the fame heat. Oxymuriatic acid gas mixed with hydrogen by light, and by heat equal to $125^{\circ}$ to $160^{\circ}$ centigrade. The fame was decompofed flowly by diffufe light, but fcarcely any at lefs than $120^{\circ}$ centigrade. The firit oxyd of mercury was converted into the fecond oxyd, and rumning mercury by diffufe light; and the fame by heat. The peroxyd of lead was changed into the red oxyd, oxygen gas being difengaged by a vivid light; and the fame was produced by a gentle heat. The oxyds of filver and platina were decom. pofed by light and by a gentle heat.
They next expofed vegetable colours to the action of light as well as heat.

A vegetable rofe-colour from faffron became white in a thort time by light ; and the fame by expofure for an hour to 160 cent.

Log-wood dye was changed to dark red by light, and by expofice $1 \frac{1}{2}$ hour to $180^{\circ}$ cent.
Brazil-wood dye became white by light, and by $180^{\text {? }}$ of heat, for two hours.

The orange colour of Indian faffron became a dull red by light. The fame was produced by $200^{3}$ of heat, for an hour and a half.

Yellow colour, from woad, was changed to ochre colour by light, and by 210 of heat applied for two hours and a half.

In all the effects of light we have hitherto enumerated, although we have fhewn that a mutual attraction exilts between light and other matter, we have not adverted to its remaining i:3 bodies from which it may be eliminated without change. Several bodies appear, however, to poffefs the property in a remarkable degree. Indeed, according to experiments of father Beccaria, almoft any fubftance expofed to the light 'of the fun for a certain time, appeared luminous when broaght into a dark room. This he found to be the cafe, when he made his own hand the fubject of experiment. This property is foon gone in molt bodies; but is reltored by frefh expofure to light. The fubltance molt remarkable for retaining this quality is Canton's phofphorus, which confilts of fulphur and lime. It is prepared by fratifying oyfter-fhells with fulphur in a crucible, and expofing them to the heat of a brifk common fire. The lime of the fhells becomes impregnated with the fulphur, and they are then broken to pieces, and kept for ufe in a thopped phial. This fubflance has the property of fhining in the dark, after expofure to the fun's light, for a fhort time. Its brightnefs is fuch, as to point out the hour of the night. If it be kept in the dark, however, for a certain length of time, it becomes lefs bright, and ultimately lofes its shining property; which it re-acquires by expofure to the light. This light is not dependent upon any combuftion, lince it pofteffes this property without oxygen, and is not increafed by :ts prefence. Heat caufes it to fhine brighter; but it gives unt its light fooner, which is only reftored by new light.

Canton, the ingenious difcoverer of this fupflance, intro:duced equal quantities of it into two glafs globes, and expofed them to the fun equally, to give them their greatelt? luminous power. They were then taken into a dark room, when they were equally luminous. One of them was now placed in boiling water, by which means it became muck brighter, but it ceafed to be luminous in ten minutes; while the other continued to fhine for two hours after. After the latter, however, had ceafed to fhine, it became luminous by the application of heat. It appears, by the account of this author, when it had ceafed to fhine at one temperature, it always gave out light in a greater, even to the point of ignition; but never after at the fame, or a lower temperature, till it had been expofed anew to the fun's light.

Thefe curious facts, on a firft view, feem to prove that the light of this fubftance is derived from the fun's rays, which enters into combination with it, and is eliminated in the dark. This fuppofition, however, is rendered improbable by other facts. When it has ceafed to thine, its property is reftored by any of the coooured rays of the folar fpectrum. It ought, therefore, to emit that particular light only to which it has been expofed, but contrary to this, under all circumftances, it gives out the fame coloured light, which is generally white.

It feems more agreeable to the phenomena to fuppofe, that the infuence of the light upon this fubitance confifts in exciting fome chemical action in the body, which cannot. be produced by heat, or, perhaps, the phenomena may be electrical, fince we find that the electric fpark, as well as light, is capable of giving it its luminous property.

A great variety of fubftances have the property of giving out light by different treatment, fome by heat, others by rubbing, and by percuffion. Moft of tha earthy falts have the property of flining in the dark, by being laid üpon an iron plate, heated a little fhort of ignition. Fluat of lime is by far the molt brilliant by this treatment. The fame is vifible, though in a lefs degree, in -all the carbonats of lime, and in carbonats and fulphat of barytes, and alfo carbonat of flrontian.

Several of the gems have the property of hiuning by rubbing. Quartz pebbles, rubbed brikly together, in the dark, give brilliant flafhes, accompanied by a peculiar odour not unlike that produced by the wheels of a carriage grinding upon ftones. The tourmalin alfo gives out light by rubbing. The fhining property of this clafs of bodies is the fame in vacuo, and any of the gafes. The caufe of there appearances is not even gueffed at: they do not acquire thefe properties from the fun's light, like the phofphorus of Canton.
We are in poffeffion of a number of curious facts relative to phofphorefcence of animal and vegetable fubttances. Canton has furnifhed a number of interefting experiments upon fifh and the flefh of animals: and the fubject has fince been inveltigated and extended by Dr. Hulme. The flefh of animals, particularly veal, at a certain period after death, begins to be lumiuous, and continues fo for fome time. The light is extinguifhed when the meat has arrived at a certain flate of putrefaction. This property, however, is more confpicuous in fifh, and fea-fifh more than that of frefh-water. A feries of experiments is given by Dr. Hulme in the Philofophical Tranfactions for 1800 , page 161.

He generally took about four drachms of the fubltance of different kinds of fifl. This he put into a three-ounce phial, to which he introduced two drachms of fulphat of magnefia, diffolved in two ounces of cold fpring-water, but occafionally he ufed other falts.

Two

## LIG HT.

Two drachms of the ftefh of the herring were put into the folution of fulphat of magnefia. On the fecond evening he perceived a ring of light round the top of the liquid, but is was dark below. On thaking the phidl, the whole became beautifully luminous, and remained in that fate. On the third night the light had again rifen to the top; but the ring was not fo bright as on the preceding night, nor was it fo bright after thaking as on the firft occafion. In another experiment, the light difappeared entirely on the thred night. The fame experiment was made with fea-water. On the fecond night the liquid was dark ; on the third lucid; on the fourth very luminous; on the fifth it began to decline; on the fixth it became lefs; and on the feventh quite gone. At this period, neither the fifh nor the liquid had any fmell of putrefcence. The fame took place in a fecond experiment. In another experiment, he utid four drachms of the roe of the herring, two drachms of fulphat of magnelia, and two ounces of water, as before. On the fecond night, on thaking the phial, the liquid was luminous; it remained foon the thrd and fourth; and on the lifth was extinct. In the fame experiment, with fulphat of foda, the effect was lefs, but it was greater with fea-water. Similar appearances took place by a fimilar treatment of the mackarel.

He next fufpended in a room the herring and the mackarel. On the fecond night the kima lide became lumin us; on the third night both files of the whele were exceedingly luminous." Dr. Hulme obferves, that the foft roe of both thefe fifl afforded the molt light. At the time thele fifh became very luminous, Dr. Hulme fcraped off fome of the luminous matter, whicti he named herring's light, or mackarel light. This fubftance he introduced to different folutions of falts.

The folutions ufed were fulphats of magnefia and foda; muriat and phofphat of fods; nitrat of potafh; Rochelle falt ; tartrat of !oda; and fea-water. He allo ufed folutions of honey and fugar : the quantity of water in each was two ounces: the quintity of each fubtance diffolved in the fane was two drachms, with the exception of the nitre, and muriat of foda, the former being half a drachm, and the latter a drachm.

The herring or mackarel light being introduced to the folution of fulphat of magnefia, rendered the whole mafs of liquid very luminous, and continued for 24 hours. All the above folutions became luminous by adding the fame lucid matter. The phofphat and muriat of foda appear to have been better than the reft. The light with 「ea-water was more permanent, being luminous for feveral days. After the above luminous matter had ceafed to fhine, the light was in fome degree revived by motion What is very remarkable in thele experiments, is the circumbltance, that when the folutions were made ftronger to a certain extent, the light became fuddenly extinguifhed, but was always reftored by dilution with water.

The light is alfo extinguihed by water, lime-water, water impregnated with carbonic acid, or with fulphuretted hydrogen, alcohoi, alkalies, and acids.

In all the above experiments the light is not attended with the leaft elevation of temperature.

By expofing this luminous matter to a certain degree of cold the light is extinguifhed; but is reltored with the return of temperature. A moderate heat caufes it to. be more bright ; but the heat of boiling water entirely extinguifes it, and delloys the property. According to another fet of experiments by Dr. Hulme, in the Phil. Tranf. for 1 §or, page 483 , it appears, that thele fubftances do not fhine brighter in oxygen than atmofpheric air. In nitrogen gas
they do not begin to fhine; although, after the fining hav commenced, they continue to fline in this gas for a limited time: the prefence of oxygen appears to be effential in firft producing this property. Dr. Hulne found, that when two herrings were expofed, with their fides touching, the unexpofed parts remained dark: he found the effeet produced by covering any part with Atrong brown paper.
In hydrogen gas the frefh fifh $b$-gins to fhine; and, if begun, it is very foon extinguifhed: it recovers its property, however, by re-expofure to the air of the atmofphere. By repeated and altcrnate expofure to thefe gafes, the light is loft and regained a number of times. This light is alfo extinguifhed by nitrous, carbowic acid, and fulphur tted hydrogen gafes. This phofphorefence is extinguifhed ith vacuo; but is reftored by letting in the air. The glowworm and rotten wood were found to poffefs limilar properties: they were fimilarly afted upon by the different gafes, by cold, and by moderate heat. The light of the fhining matter from the fifh was extinguifhed by a heat from $96^{\circ}$ to 100 of Falirenheit: the temperature of $110^{\circ}$ impaired, but did not extinguifh the rotten wood: the temperature of $114^{\circ}$ increafed the brilliancy of the glowworm ; but the temperature of $212^{\circ}$ extinguifhed both.

It appears that rotten wood, like the filh, does not give out light till it has been expofed for fome the to the air : it retains its luminous property immerled in fp:ing-water, or difllled-water, and alfo in linfeed oil ; it is, however, extinguifhed by auds, by alcohol, and, perhaps, by alkalies. The luminous matter of the glow-worm is a liguid fecreted and retained in the lower part of the abdomen. If the fluid be fqueezed out, it filll retains its fhining property, and may be fpread upon the palm of the hand; but it foon in this tate difappears.

This property is obferved in fome other infects, particularly the lantern-liy of the Weft Indies.
The light of a great number of thefe artificial and riatural pyrophori dues not appear to depend in the lean upon the prefence of oxygen. Of this kind are phofphorus of Canton, the different earthy falts which fline by the application of heat, and fome other minerals which thine by friction and attrition. Thofe of which we have latt treated require the prefence of oxygen, at leaft to acquire the property of fhining. This circumlance renders the fuppofition of Dr. Hulme rather improbable, namely, that the light is a component part of the body from which it is illuminated. The only thing which the facts above given can be allowed to have eltablinhed, is that, during a certain flate of the animal fubstance, between death and actual putrefaction, fome procefs is carricd on in the prefence of oxygen, by which light is evolved; and that during the time the fubttance is in vacuo, or in fome gas which is dettitute of oxygen, this procefs is fufpended, and by the prefence of other fubftances totally tlopped. The fact of its continuing to fhine in nitrogen, might arife from the prefence of a fmall portion of oxygen. It appears, from the circumftance of its fhining in atmofpheric air, as much as in oxygen, that very little oxygen is neceflary. Forfter afferts that the glow-worm fhines brighter in esygen, but the oxygen does not appear perceptibly impaired. This fhews, that although oxygen is necelfary, the quantity required is very fmall,

It has been too common for chemifts to draw the following conclution, that when light, or light and heat together, are evolved, that it nult either have arifen from combuttion, or that the light is a component part of the body from which it is difengaged. As, for inftance, becaufe Canton's phofphorus thines without the prefence of oxygen,

## Li G H T.

the light is called light of combination; and Dr. Hulme has, with lefls foundation, drawn the fame conclufion. Inflead of faying that light and heat are products of combination, from the union of oxygen with inflammable matter, we fhould fay that it is the refult of rapid chemical combination, when the bodies have great aflinity for each other.

We have feveral facts which confirm this idea. When Atrong mineral acids combine with pure potafh, lime, or magnefia, much heat and fome light are emitted. The fame thing is alfo obferved in flacking of lime. In an experiment, made by a fociety of chemitts, it appears, that when a mixture of fulphur and copper filings is expofed to a red heat, in a glafs tube, the oxygen being excluded, the two fubitances fuddenly combine, attended with the difengagement of lisht. In thofe chemical changes where heat and light are difengaged, the following law will obtain. The change of temperature will be as the differnce between the ipecific heat of the compound body, and half the fum of the fpecific heat of the bodies before combination ; while the inteufity of the light and heat will be inverfely as the time in which this change has been taking place.

We fhall here leave the fubject of phofphorefcent light, to give fome account of that produced by combuftion; in treating which, we fhall find our progrefs much facilitated, by confidering combuftion as dependent on the above law, rather than upon the laws of combution, as laid down by Lavoifier, who was of opinion, that the light and heat furnifhed by combultion were entirely derived from the oxygen. If, as we have fuppofed, the quantity of heat be greater, as the fpecific heat of the refulting compound is lefs than the mean of the bodies befare combination, we ought to have heat evolved whenever fuch change can be proved; and by afcertaining, before hand, the feccific heat of the compound, and of the elements, the quantity of heat may be known. Experience has already given great ftrength to this notion. The intenfity of the light and heat, however, during thefe changes, will not depend upon the abfolute quantity evolved, but upon the rapidity of the evolution; and, if we are not greatly deceived, the quantity of light will always be as the rapidity of combuttion. In the flow combunion of hydrogen gas, the light is not'great, but the whoie heat \%'s greater than that afforded by any other combuttible body. On the other hand, the abfolute quantity of heat afforded by the combuttion of phofphorus, is much lefs than that evolved by burning an equal weight of hydrogen; but the quantity of light given by the former, much exceeds that of the latter. The intenlity of light, however, will alfo be inverfely as the fpace which it occupies, and hence it will be as the fpecific gravity of the combuttible body. We may therefore conclude, that the quantity of light afforded by combultion will be as the rapidity of combultion, which will be as the affinity of the body for oxygen, as the denfity of the burning body, and inverfely as the cohefion of the body. The difference of cohefion between charcoal and the diamond accounts for the relative combultibility of thefe two bodies. For this reafon, foft iron wire ought to afford more vivid combution in oxygen than theel wire.

In order to obtain a relative idea of the value of different combultible bodies, ufed for procuring artificial light, we fhall detail fome ingenious experiment: inade by Dr. 'Henry, and publifhed in Nicholfon's Journal, vol. xi. p. 65 .

Dr. Henry, with a view to afcertain the relative value of the combultible gafes, made fome trials with hydrogen, carburetted hydrogen, and carbonic oxyd. Thicfe he found
did but afford a very inferior light, compared with the Splen. did light given by the gas afforded by the deltructive dittillation of pit-coal, which is equal to the light given by the fineft fpermaceti oil. The following table points out the refult of his experiments, and clearly thews the caufe of the fuperior property of coal gas to produce light.

| Kind of Gas. |  | Meafures of rarlonic acid protured. |
| :---: | :---: | :---: |
| Pure hydrogen | 50 to 54 | None |
| Gas from moift coal | 60 | 35 |
| Do. Wood (oak) | 54 | 33 |
| Do. dricd peat | 68 | $\div 3$ |
| Do. from cannelcoal | 170 | 100 |
| Do. Lamp oil | 190 | 124 |
| Do. Wax | 220 | 137 |
| Pure olefiant gas | 244 | ${ }^{179}{ }^{\circ}$ |

The firt column contains the different gafes, 100 meafures of each being ufed in each experiment. The fecond, the meafures of oxygen which were confumed, while each of the 100 meafures were burning. The third, the quantity in meafures of carbonic acid, which refulted from the combuftion. It is a fact, already afcertained, that every meafure of carbonic acid gas has refulted from a meafure of oxygen; confequently, the quantity of oxygen confumed in its formation is equal in meafure to the numbers in the third column ; the excefs of oxygen, therefore, appearing in the fecond. By fubtracting the number in the third from that in the fecond, it will give the quantity of oxygen which has combined with the hydrogen in each of the gafes. This excefs of oxygen, in the fecond column, will combine with two meafures of hydrogen, to form water. In order. to form fome idea of the relative value of thefe combultible gafes, we will compare the firit, which is pure hydrogen, and the latt, or the pure ole fiant gas, which has the greateft efficacy in producing light. The 50 meafures of oxygen in the firit combine with 100 of hydrogen, and fince no carbonic acid is produced, this is the whole effect. In the laft experiment, I79 of carbonic acid is formed at the expence of 179 meafures of oxygen, and about sths its weight of carbon, which would alone have furnifhed confiderable tight. Since, however, $28+$ meafures of oxygen are expended, we have $2 \$ 4-179=105$ meafures of oxygen, which would require 200 meafures of hydrogen. If, therefore, hydrogen and carbon were equally efficacious as combultible bodies in producing light, the quantity of light in one, to that in the other, would beas $210+\frac{5}{5} \times 179: 100$, or as 25 to $i$ nearly. The ratio of the fpecific gravities of thele grafes is as 90 to 8 nearly; therefore, multiplying thefe rarios, we get 270 to 8 , or 34 to 1 nearly, for the relative intenlity of the light of each.

Thefe different gafes are here fuppofed by Dr. Heary to be mixtures of feveral gafes, the compofition of which is known, and all confilting of different proportions of hydrogen and carbon, with the exception of the carbonic oxyd,

## LIGHT

which contains oxyzen. Now, fetting afide the later gas, which being partly faturated, the reft will be in their effect to produce light, as the quantity of carbon they contain; not that carbon is nore effective than hydrogen, but becaufe the fpecilic gravity of the yas is increafed by the carbon. Since, therefore, the olefiant gas contains the mont, and is of the greatelt fpecific gravity in confequence, thofe gafes which contain the greatelt quantity of olefiant gas, mult be the beit for producing light by combuktion. Now, it may be feen in the table, that the gafes obtained from lamp oil and wax are the next to the olefiant gas in their effect of giving light ; and hense we may conclude that thofe gales contain a large proportion of olefiant gas, and of courie feem well fitted for producing artificial light. If we may judge by analogy, we may expect that the fpermaceti fat will ftand as high as the oil, and the beft tallow may, perhaps, be the next in order. During the burning of thefe fubltances, the vapour which, when kindled, contitutes the flame, may confilt of a great proportion of the olefiant gas. In the burning of all fatty fubltances, hewever, there is a great redundancy of carbon, which flies off with the gafeous products in the form of fmoke, and which is burnt in the Argand lamp. The above facts will furnifh an elegant and fimple method of appretiating the relative value of the different combultible bodies to produce light. See Gas-lights, Lamp, and Consbustion.

The light which is furnifhed by combution, and commonly called artuicial light, is confidered by moft philofophers as being a component part of the bodies employed in the combuftion. Even in the fimple procefs of heating a body redhot, it is faid that the body at that temperature begins to give out light. It is rather curious, that all bodies fhould give out light at the fame temperature, which is faid to be about $800^{\circ}$ Fah. It would appear, from a fact given by the late Mr. Wedgewood, that the emanating medium is heat or light, according to the denlity of the body from which it is emanated. The heated air is fo hot, as to make a thin תlip of gold appear red-hot, although the aerial medium did not become luminous. Terreftrial light, as it appears to poffefs moft of the properties of folar light, like it, can be tranfmitted and refracted by tranfparent bodies, and it frictly refembles it in being reflected by the fame bodies. It is faid, however, to contain a different proportion of the coloured rays from that of folar light, being defective in the blue, and redundant in the red rays.
Doctor Herfchel has made a number of expariments upon terreltrial heat, in order to compare it with the heat furnifhed by the fun; but he feems to have taken it for granted, that the folar light and the artificial do not differ, although his experiments prove, that terreftrial heat and folar heat differ effentially. Artificial heat does not pafs through glafs, while the folar calorifc rays pafs eafily through the fubftance of a prifm, and afterwards through a convex lens.

It has been found that artificial light has fome chemical properties. The Abbe Teffer found that the green colour of vegetables is produced by the light of a lamp. This fact has been conlirmed by Decandolle.

Ligut, Exbilision of, by fiving Animals. This fingular property belongs only to creatures of a fimple Rerueture. It appears to relide only in certain \{pecies of the four lath claffes as eltablifhed by modern naiuraliits, viz. mollufia, infeits, worms, and anplyytes.

The mollufith and werrens contain each but a fingle fpecies. which has been infertained to thew lighe; for the account of certain fpecies of lepas, murex, and chanad yie'dintry ligh:。 dues not feem to reft upon any grod authority, and the Rories toid by Brugucire and by Flaugergucs of carth-warms being luminous, are improbable 1 il themfelves, even if they were not contrary to common obfervation. Sce Journal d'Hifoire Naturelle, tom. ii, and Journal de Phyfique, tom. xvi.
The examples of luminous feecies are more numerous amongtt infocts than in any other clafs. They are to be found in the following genera; cluler, lumpyris, fulgora, pazifus, foclopcndra, cancer, bynceus, and limulus.

There are alfo many luminous zoophytcs, particulariy in the genus Medufa, and in the new genus Berce.
Some writers have attributed the property of flining while alive to certain fifbes; but, as it would appear, upon very queftionable grounds. In a serage from France to Cayenne, Mr. Bajon faw in the fea a number of lumirous points which fhone when truck, and another appearance of pale flames, about three feet below the furface of the water. He likewife obferved in the migration of the dorado and other fifhes, that their bodies were ft:dded with fimilar luminous points. Upon examination he difcosered thofe to be minute fpheres which adhered to the furface of the fing. Thefe were moft probably the fmall fpecies of luminous medufa. We fhall hereafter notice that Bajon's obferrations therefore fhewed no property of fhining in the fift themfelves.
Godeheu de Riville fates in a paper he fent to the Academy of Sciences, that he found in the Scomber pelanis, on opening it alive, an oil which was extremely luminous. It fhould. be obferved, that Riville was prepoffeffed with the opinion of all the luminous appearances of the fea being occafioned by a peculiar oily fluid: other parts of his Memoir fhew inaccuracy of information; and it may be added, that if the oil of fifles were ufually luminous, as fuppofed by Riville, it would be a fact very generally known.

We flall now proceed to confider the luminous property in thofe animals which have been afcertained to poffefs it. Afterwards we fhall defcribe the peculiar organs from which the light is known in certain fpecies to emanate ; and lafly, we thall examine the opinions that have been entertained refpecting the nature and origin of animal light.

The fpecies of Pbolas, deferibed by Pliny under the name of Dadylus, has long been known to polefs remarkable powers of evolving light. It is recorded by Pliny, that every part of this aximal's fabfance is charged with a fluid, which, like liquid phofphorus, reriders any object luminous with whic's it comes into contact.

Reaumur has confirmed the obfersations of Pliny; he found alfo that the water contained in the thell of the dactylus, and other fluids in which the animal might be immerfed, acquired the property of ficing, and after touching the creature, the hazds communicated to common water a milky or pale phofphoric appearance. Reaumur obferved that the light was moft vivid when the dazylus was frefh; it afterwards gradually declined until it became extinct. He dried the entire animal, which deprived it of all power of fhining, but this was reltored in a weaker degree even after four, or five days, by moiltening it either with frefl or falt water. So far from the procefs of diflolution being at

## IIGHT.

ali neceffary to the luminous appearance of the daajitus, Reaumur found that it was deitroyed by putting putrid individuals amongt thofe which had beer recently taken. Mem. de l'Acad. des Sc. de Paris, 1712.

There are three luminous fpecies of elater; the notisurus, phofphoreus, and ignitus. The firt of thefe thines fo brilliantly, that before the arrival of the Spaniards in South America, it is faid many tribes of Indians ufed no other light for tranfacting their ordinary bufinefs; and at prefent the women wear the infeck at night as an ornament in their head-drefs. Dr. Patrick Brown, in his Hittory of Jamaica, fays, the elater noctilucus is feldom met with during the day, it being then torpid; it flies by night, at which time it emits an unfteady light, having alternate moments of darknefs. He obferved, alfo, that the extinction of the light depended upon the will of the animal.
It is well known, that in the elaters the light proceeds from the fmooth yellow fpots fituated upon the corcelet; but Dr. Brown feems to think that all the internal fubftance is equally luminous, and that the yellow fpots appear fo in a greater degree than the other parts, in confequence of the tranfparency of the fhell at thefe places favouring the tranfmiffion of the light. He fays, in forcing the rings that cover the different parts of the body a little afunder, you may obferve the fame light to iffue from all the entrails indifcriminately. The internal parts of infects are fo tranfparent, and would permit fo much light to pafs through them from the proper organs, that Brown might readily have taken up the above opinion without its being well founded. Thus we have oblerved, on opening the glownsworm at the back in the dark, that the light thone through all the inteltinal parts.

There is fome obfcurity in the accounts of naturalifts with reípect to the elater phofphoreus. Degeer diftinguifhes it from the nodilucus, on account of the yellow fots being vifible on both the upper and lower fides of the corcelet; but we have found that this is to be obferved in the latter fpecies alfo. The principal, and perhaps the only real diftinction of the phopphoreus, is its fmaller fize than the noclilucus.

The elater ignitus of Fabricius is confiderably fmaller than the preceding fpecies, and is fufficiently characterifed by having the margins of the corcelet yellow, in place of the two yeilow fpots.

The genus Lampyris contains many fpecies which emit light; of thefe we may mention the $L$. nociluca, or common gloru-zvorm; L. folenditula, of which Degeer confiders the nociluca as a variety; the $L$. ignita, $L$. phofphorea, $L$. nitidula, L. lucida, L. italica, L. japonica, and L. penfylvanica, which laft appears to be the Pyralis minor of Brown. Probably other fpecies of lampyris'might be enumerated amongt thofe that have the property of fhining; but as the light of all the lampyrides appeara to be produced nearly in the fame manner, it is not fo neceffary to our purpofe, to fix with precifion the number of the luminous fpecies.

The lampyrides, like the elaters, have the power of regulating at pleafure the degree of their light, or of fufpending it altogether. The colour of the light depends upon its Atreugth; when very weak it is of a faint emerald colour, and in its moft vivid ftate it is a bright yellow or orange colour.

The glow-worms of this country are only luminous in the feafon for procreation, which lafts during the fummer months; when the females are impregnated, and have depofited their eggs, they thine no longer. This circumftance has authorifed the common opinion, that the exhibition of light is made for the purpore of guiding or inviting the male infect.

The glow-worms moft frequently affemble in numbers upon dry banks, or under hedges on the fides of unfrequented roads; they are rarely feen on public roads or in fields. They do not difplay their light upon all nights alike; fcarcely one of them will be feen for feveral nights together, and then, as it were by common confent, they appear with great fplendour for a few nights, after which they again retire. Their difappearance probably depends upon their meeting with the male infect, for we have not obferved that the ftate of the weather has any influence upon them. They commonly begin to fhime before it is quite dark, and extinguifh their light fome time before the approach of day. It is remarkable with what regularity their inltinet guides them in this particular; we have kept them the whole day in darknefs, without their fhewing any defire to move or expofe their light, yet in the evening, although purpofely placed near burning candles, they crawled about and flone with brilliancy.
The light of the glow-worm is always molt vivid when the creature is in motion; it may alfo be excited or encreafed by turning the infect on its back, or otherwife teazing it. But the luminous appearance is interrupted at all times by fhort and irregular periods of either diminithed light or total darknefs; ufually, however, there are two fmall fpots on the laft ring of the abdomen, which retain their light whillt the other luminous rings ceafe to fline.
The lampyris italica has been obferved, like the nosiluca, to have the power of modifying its light; it is, however, rendered more brilliant at each motion of its wings. Mem. de l'Acad. des Sc. 1766.
The pyralis minor of Brown exhibits a vacillating light ; fometimes ftronger, fometirnes weaker, and at times dying wholly away. The light is always renewed in a few feconds, the obfcure intervals being of fhorter continuance than the moments of illumination, which the creature feems able to command at pleafure. Every pert of the abdomen appears to yield light in this infect, which is flronger and more conftant than what is emitted by the elater nociliuczus. Brown's Hittory of Jamaica.
It has been afferted, that the larva and chryfalis of the lampyrides are luminous. Degeer mentions, that the larva of the lampyris italica has been miftaken by Linnæus for the perfect female infect.
M. Gueneau de Montbiellard not only fates the larva and chryfalis of the glow-worm to be phofphorefcent, but that the eggs alfo for two, three, five, or more days after they are expelled from the female, emit light without intermiffion or decreafe, and that for an equal time their light declines until it becomes extinct. . He obferves, that it is. not nèceflary for the eggs to be fecundated, but thofe which thone longeft produced the larvæ. In one inftance he did not find the eggs to be luminous; on another occafion, fome eggs, which were laid on the 12 th of June, fhewed a degree of light, even on the 28 th of July. Memoire fur la Lampyre. Acad. de Dijon.
We have very frequently had great numbers of the eggs of the glow-worm in our polfeffion, but we never faw them in a luminous ftate, except upon one occation, when they fhone unremittingly for feveral days together, as deferibed by Montbiellard; the fact is, therefore, the more remarkable, on account of the rarity of its occurrence.
Befides the fpecies of fulgora, in which the luminous faculty has been noticed, there are probably feveral others, if we may judge by analogy of ftructure, that alfo poffefs it. The individuals moft diftinguifhed for this property, are the lanternaria, candelaria, and pyrorbyncbus.

The fulgora lanternavia difplays a very brilliant farkling

Hight, which is only feen during the night when the infeet is in motion. Madam Merian having once collected a number of this fpecies, fhe enclofed them in a box, without being aware of their luminous property. Being one night attracted by the noife that proceeded from the box, fhe opened it, and, to her great furprife, found every infect in motion, and yieldEng a ftrong light. Merian Surin.

Cuvier feems to entertain fome doubts of the luminous property of the lanternaria. He fays, in his Tableau Elementaire de l'Hifoire Naturelle, fome voyagers have afferted, that the projection from the head of the infect emits a vivid Jight, but it appears, at lealt, that this does not exilt at all times.

The fulgora candelaria has been obferved to throw out flafhes of light, which are fucceeded by moments of obfcurity.

The fulgora pyrorbynchus has been reported to fhed a radiant light.

With refpect to the luminous property of the other ful. gora, we are not in poffeffion of any particulars.

The paufius /pberocerus has been difcovered to yield light by Dr. Afzelius. On going to look at his fpecimen one evening, he fays, he happened to ftand between the light and the box in which it was contained, fo that his fhadow fell upon the infect; he obferved, to his great aftonifhment, the globes of the antennx, like two lanterns, fpreading a dim phofphoric light. He examined the infect feveral times during that night, when the fame appearance ftill prefented itfelf; he was, however, difappointed in not having the opportunity of making further obfervations upon the animal, as it was fo much exhaufted it died before morning, and he was not able to procure another fpecimen. Limnæan Tranfactions, vol. iv.
The folopendra eleariea is an infeat frequently found in this country, but is not obferved to be luminous at all times. Degeer faid he never faw it emit light, which was probably owing to the animal being only luminous under particular circumftances. It would appear that this fpecies is incapable of fhining unlefs after expofure to folar light. In feveral experiments that were made upon the foolopendra redrica, it was found, that the creature could not be excited to fhine after it had remained all day in a dark fituation, but a fhort expofure to the light appeared to be fufficient to reftore the luminous property.

The light produced by the fcolopendra slearica has a dull phofphoric appearance; it is a momentary emanation, which only takes place when the creature is diturbed or preffed.

The fcolopendra phofphorea is but imperfectly known; in the edition of the Syitema Naturx, publifhed in 1767 , Linnxus ftates, that this infect is an inhabitant of Afia; that it yields, during the night, a light refembling that of the glorvfoorm, and that it is caught by falling from the fley on fhips in the Indian and 式:hiopian feas, 100 miles from the continent. Linnæus quotes as his authority, Car. Gueft. Ekeberg, who, he fays, faws, defcribed, and delineated the animal.

Ekeberg was a Swede, and the captain of an Eall Indiaman. He made fourteen voyages, but, as far as we can learn, rever publifhed his difcovery of the fcolopendra phofphorea, and as we have no fubfequent accounts of this infect by other voyagers, its real characters, and perhaps exiftence, mult remain doubtful.

The canter fulgens was difcovered by fir Jofeph Banks, during his firit voyage with captain Cook, in the paffage from Madeira to Rio de Janeiro. He obferved, that its whole body was illuminzted, and produced very vivid flathes of light. Phil. Tranf. 1810, part ii.

Hablitzl relates, that a cable being on one occafion drawn up from the fea, it was found to exhibit light, and, upon clofer infpection, it was perceived to be covered with the cancer pulex. Hablitzl ap. Pall. n. nord. Beytr. 4. p. 396.
Thules and Bernard, of the academy of Verfailles, allo reported, that they met with the cancor pulex entirely luminous.
In different fyftems of natural hiflory, the property of fhining is attributed to this fpecies of cancer, probably only on the above authorities. The accuracy of the affertion might perhaps be fill called in queftion, as the cancer puleef being frequently under our eyes, its luminous property, if it exifted, could hardly efcape more general obfervation.

In 1754, Godeheu de Riville difcovered a luminous teftaccous infect on the coaft of Malabar, which appears to belong to that divifion of the Linnean genus, monoculus, called by Muller lynceus.

Riville, perceiving the fea around his fhip to errit a very brilliant light, procured fome of the water and ftrained it ; after which it ceafed to thine, but the cloth was covered with luminous fpecks, that refembled in form and magnitude the ova of fifh; on being examined in the light, with a magnifying glafs, they were difcovered to have an internal motion ; fome that were fet at liberty in the water were feen to fwim with great rapidity like water fleas. Riville feized one of thefe with a pair of forceps, which caufed it to fhed a luminous liquor of a blue colour, that illuminated the water to the diftance of two or three lines.

Some of thefe animals were put into frefh water, which they furvived only a few feconds, and defcended, ftruggling, to the bottom of the veffel; many of them rendered much Iuminous fluid while dying.

Riville defcribes this creature as being enclofed in a fhell refembling an almond, fplit along the fide, and notched at the upper end, which is fo tranfparent that all the internal parts are feen through it. The infect has four jointed antennæ, furnifhed at their extremities with long fetr. There are two feet armed with hooks; and below thefe, a thick foot terminating in feveral claws. The vifcera are contained in a round fac; and at the lower part of the fhell there is found a number of azure-coloured globules, which Riville confidered as refervoirs of the luminous fluid, becaufe they became of a dull yeliow colour when the animal was about to die: but they are more probably the ova, which are allo vilible in this fituation in other teftaceous infects.
The luminous liquor fhed by the animal does not, Riville fays, mix with water, but floats on the furface like globules of oil. By ftraining fome water from which the animals had been removed, timilar globules were left in a diftinct form upon the cloth. From thefe circumftances, he was difpofed to believe that the globules he faw were really of an oily nature : which opinion he was in a great meafure induced to adopt, from a preconceived theory, that all the luminous appearances of aumals depend upon the occafional prefence of an oily fluid. Memoire fur la Mer lumineufe. Menı. Etrang. de l'Acad. des Scien. tom. iii.

A few years ago, captain Horfburg prefented fir Jofeph Banks with fame notes on the luminous appearance of the fea, and a drawing of a phofphorefcent marine infect, which have been publifhed in a paper of. Mr. Macartney's communicated to the Royal Society in 1810.
Captain Horburg remarks, that the Iuminous ${ }^{\circ}$ fate of the fea between the tropics is geverally accompanied with the appearance of a great number of marine animals, of various kinds, upon the furface of the water; to many of which he does not, however, attribute the property of

Shining.

## LIGHT.

Thining. At other times, when the water which gave out light was examined, it appeared only to contain fmall patticles of a dufky flraw colour, which difolved under the fighteft touch of the finger.

Captain Horfourg likewife obferves, that in Bombay, dluring the hot weather in the months of May and June, he las frequently feenthe edges of the foa much illuminated by minute fparkling points. Thefe, whilit in the water, nlways avoided feizure, by moving away from the hand, fo that it was with difficulty he procured any of them. Upon two occafiono he fuccceded in detecting the animals that caufed the light of the fea. At fun-rile, on April 12th, 1798 , in the Arabian fea, he perceived feveral luminous fpots in the water, which conceiving to be animals, he went in the boat, and with fome difficulty caught one. This infect, he fays, refembled the wood-loufe in appearance, and was about one-third of an inch in length. When viewed with the microfcope, it feemed to be formed by fections of a thin cruftaceous nature. During the time any fluid remained in the animal, it fhone brilliantly like the fire-fly.

In the month of June of the fame year, he picked up an infect on a fandy beach, which gave light. This was alfo covered with a thin thell, but was of a different fliape and a larger fize than the animal taken in the Arabian fea.

Mr. Macartney entertains no doubt that both thele infects were monoculi. The firit he refers to the genus $L i$ mulus of Miiller, and gives it the fpecilic name of Noaillucus. Sce Phil. Tranfact. ISio, part ii.

The light of the fea has been moft frequently afcribed to the prefence of a minute fpecies of worm, the nereis nociluca of Linnæus, even by thofe who did not pretend to have feen the animal.

This creature was firf defcribed under the name of lucsioketta marina, in a fmall pamphlet publihed by Dr. Vianelli at Venice, in 1 749. He found about thirty of them on the leaf of an alga, taken up from the lake of Chioggia. By fhaking the leaf, he fucceeded in procuring one of thefe on a piece of white paper. To the naked eye it appeared, in form and magnitude, like the half of the hair of the eye-lid. It had a yellow colour, and was formed of very tender fub. flance. Wher it was examined under the microfcope, he difcovered that it had the figure of a worm, and confilted of joints or fegments. It had two antennx; a number of fetaceous proceffes along each fide of the body, which he conlidered as fins; and under thefe, other twilted proceffes znalogous to feet. Nuove Scoperte Intorno le Luci notturne dell' Acqua marina fatte da Guefeppe Vianelli.

Vianelli's obfervations were repeated foon after by Grifelini. Ha procured fome of thefe animals upon the feaweed, on which they are ufually found; and having placed one of them in fome water, between two concave glafles, he fubjected it to microfcopic examination with the higheft magnifying powers: by which means, all the parts of the worm were very evident. He defcribes the head as having two fhort antennx, and a horn-fhaped procefs between thefe, and two dark coloured eyes. The lateral proceffes, lice fays, form tranfparent cafes, which terminate in a denticulated manner, and contain each a tuft of hair. The other procefles are alfo tranfparent, extenfile, and fometimes entwined together.

He obferved that the light is fhed at all feafons, but is moit triking and moft frequently feen in fummer. When the wind is about to change from the S.E. into the E., the light is increafed; and in the dark winter nights which fucceed a warmefun, the luminous appearance is produced as in fummer.

Grifelini further mentions the hining of another marine iufect, which appears to be the monoculus difeovered by Riville. Obfervations de François Grifelini fur la Scolopendre marine luifante, Venife 1750.

The fame animal has likewife been defcribed and figured by Adler, under the name of the nercis phofphorans. His. defcription coincides with that of Grifelini. He flates that this §pecies is found in the African and Indian oceans, but that it is ravely met with in the Northern feas. Amcenitates Academicx Carol. Linne.
'The nercis nociluca was feen by the abbé. Nollet, M. Rigand, and Fougeroux de Bondaroy. The latter, however, defcribes it to be the fize of the bead of a fnall pin. He fays it increafes, diminifhes, or extinguifhes its light at pleafure, which commonly iffues from the pofterior part of the body; but when fully illuminated, the head only is opaque. The colour of the light is blueifh. When fqueezed, it theds a train of luminous fluid; which appear* ance is alfo feen, in a degree, when it is agitated in the water. He mentions having obferved two fizes of the animal, but cannot determine whether thefe are different ages, fexes, or fpecies. Mem. de l'Acad. des Scien. 1767.
The abbè. Dicquemare flates, that-he faw the luminous animals difcovered by Vianelli; that he exhibited them tohis pupils during his lectures, and deliseated them at thefame time. Thefe drawings he fent to Rigaud, whol returned for anfwer, that the deligns were precifely the fame of thofe which he had himfelf executed. Journal de Phyfique, tom. vi.

Spallanzani allo afferted that he had feen the nereis noti*luca.

After fuch a ftriking concurrence of teflimony, we cannot prefume to doubt the exitence of this fpecies. of luminous animal: but we are led to think that it never. vifits the coafts of this country; as in numerous examinations-we have made of fea-water in a luminous ftate, we have not met with it: Judging from our own experience, and comparing it with the obfervations of others, we are led to conclude that tho nereis nociluca is, generally Speaking, a rare fpecies, and that the light of the fea is moft frequently occafioned by medufa.
The largeft and moft fplendid of the luminous medufa is the pellucens, which was dificovered by fir Jofeph Banks, in the firlt voyage of captain Cook. It was taken up from thefea, at the fame time with the cancer fulgens already mentioned, in the paffage from Madeira to Rio de Janeiro. This fpecies meafures fix inches acrofs the crown or umbella, which is marked by a number of opaque lines that pafs off from the centre to the circumference. The edge of the umbella is divided into a number of lobules, which fucceed: each other, one large and two fmall ones alternately. From within the margin of the umbella there is fufpended a number of long cord-fhaped tentacula. The central part of the animal is opaque, and furnifhes four thick irregularly fhaped proceffes, which hang down in the midit of the tentacula.

The medufa pellucens throws out flafhes of light during its contractions. which are fo vivid as to affect the fight of the beholders. When the water in which thefe animals, and fome of the cancer fulgens, were contained, was emptied out of a bucket, it appeared like a Itream of fire, or fufed gold. Phil. Tranf. 1810 , part ii..

The medufa noailuca is deferibed by Forfal; as meafuring. about three inches in diameter, and about one and a half inch in depth. Its furface is convex, of a reddilh glafs colour, with brown fpots. The margin is notched into 16 lobules.

The central part, containing the vilcera, hangs down for fome way, and is furrounded by eight fomewhat broad tentacula. Forfkal, Deferiptiones Animalium.

This fpecies is reported to be extremely luminous, particuIarly round the margin.

Forlkal has defcribed alfo a fpecies of luminous animal under the name of medufa denfa. It appears to be a beroc, and correfponds moll nearly with the medufa pileus of Gmelin.
A. luminous fpecies of medufa was difcovered by Spallanzani in the ftrait of Mefina. Its form is convex, with a finbriated margin. There are four thick tentacula, and eight which are long and flender. Thefe are each hollow. In the concavity of the umbella there are four fmall groups of Yong thin bodics, entwined together like inteftines, and adhering to an entangled mafs of fmall tubes of a filver colour, that are extremely tranfparent and elaitic. At the internal edge of the cavity of the umbella there is a thin mufcular lamina. The purfe communicates with four lateral orifices, and has an aperture befides. Spallanzani reprefents this fpecies as being exceedingly luminous. He fays it fhines like a torch, and is vifible 35 feet below the furface of the water. The light is variable; fometimes it continues for a quarter or half an hour, or longer; at others it becomes fud. denly extinct, and re-appears after a confiderable interval.. He fuppofes that the ceffation of the light depends upon the animal being at perfect reft. Memoria fopra le medufe fofforiche. Mem. della Suc. Ital. tomo vii. and Spallanzani's. Travels in the Two Sicilies.

Spallanzani further Rates, that he difcovered in that part of the fea next the eaftern coaft of Genoa, in addition to the nereis noctiluca, five other fpecies of fea glow-roorms, as he calls them, two of which he met with again in returning from Meffina to Lipari. He propofed to give a defeription of thefe animals in his Voyage to Conftantinople, which book, as far as we can learn, was never publifhed:. We muft, however, confefs, that Spallanzani's known fondnefs for the wonderful, would lead us to receive thefe difcoveries with fome degree of diltruit, particularly as they have not been confirmed by the obfervation 3 of others.

One of the molt brilliant of the whole tribe of luminous. creatures has been lately difcovered by Mr. Peron in the Atlantic ocean. Moft naturalifts would, from the general appearance and Atructure of the animal, confider it as a fpeciesof beroo, but Peron has created a new genus, of which this is the only fpecies yet difcovered, and which he calls the Pyreforaa atlanticum: The animal has an elongated and nearly cylindrical figure, truncated at one extremity, and rather conical at the other. The body is hollow, and does not contain any organ, except a very delicate net-work of veffels, which is fpread over the internal furface of the cavity. The circular aperture, or mouth, is furrounded internally by a number of rubercles. The external furface is tludded with fome'thick elongated' tubercles, and others of a fmaller fize. They are the principal feat of the light, and fhine like polified diamonds. The interior of the fubftance of the body contains a number of fmall elongated glands, which are alfo more luminous than the tranfparent part.
The colour of this animal when at reit, or after death, is an opalein yellow mixed with a difagreeable green; but during the contractions of its body, the creature appears, as it were, to kindle, and becomes inftantly of the -red colour of fufed iron ; -it afterwards paffes through different tints, as aurnra, orange, green, and azure blue, according to the firength of its illumination.

The pyrefoma, when at the fame depth in the fea, gives the appearance of a red-hot bullet, but when floating on the
furface of the waves, refembles a cylinder of incandefcent iron. It was obferved to perform regular and alternate motions of contraction and dilatation. The light is evolved during the contractile motions, and thefe may be excited irregularly, by touching the animal, or merely by agitating the water in which it is contained. The pyrefoma, like all the other luminous mariue animals, exhibits no light after death.

Mr. Peren only met with this fpecies in a certain latitude, and obferves that the mollufica and zoophytes, which are found at great depths in the fea, or at great diftances from any fhore, always inhabit particular regions of the ocean, out of which they are very rarely met with. Annales du Mufeum d'Hitoire Naturelle. Mem. par Peron. 24 Cahier.

The pennatula phofpborea is well known to exhibit light, which, Dr. Shaw ttates in his Hiltory of Algiers, is fo ftrong, that it directs the fifhermer in their oscupation.

The luminous effect is confined to the plumule of the pernatula, or that part which is inhabited by the polyps. Spal'anzani, in a letter to Bonnet, ftates that the light is only. emitted when the fea pin is in motion, and that there is amucous luminous-fubfance furnihed by the polyps, whichis foluble in water, and becomes mixed with the fea-water, that is admitted into the pin by means of a hole fituated at. the extremity of its ftalk. (Mem. Soc. Ital. tomoii) Otherfpecies of pennatula are faid to be luminous, particularly the. grifea, argentea, and grandis. 'The light exhibited by the latt. is reported to be an afh colour.

In a paper upon luminous animals communicated by $\mathrm{Mr}_{\mathrm{s}}$. Macartney to the Royal Society in 1810, he gives an account of three fpecies he difcovered on our own coafts. One. is a beroe not defcribed by authors. Another agrees fo. nearly with the medufa bemijpherica, that he conceives it to be the fame, or at leaft a variety of it. The third is a minute fpecies of medufa, which he believes to be the luminous animal. fo often feen by navigators, although it has never been diftinctly examined or defcribed.

Mr. Macartney firt met with thefe animals in the month. of, October 1804, at Herne bay, a fmall. watering place: upon the northern coalt of Kent. Having obferved the feato be extremely luminous for feveral nights, he had aconfiderable quantity of the water taken up. When perfectly: at reft, no light was emitted, but on the flighteft agitation of the veffel in which the water was contained, a brilliant fcin* tillation was perceived, particularly towards the furface; and when the veffel was fuddenly ftruck, a flath of light iffued from the top of the water, in confequence of fo many points flining at the fame moment. When any of thefe fparkling points were removed from the water, shey no longeryiclded any light. They were fo tranfparent, that in the air they appeared like globules of water.. They were more minute than the head of the fmallet pin. - Upon the flighteft touch, they broke and vanifhed from the fight. Having furained a quantity of the luminous water, a great number of thete tranfparent corpuicles were obtained upon the cloth, and the wator which had been: ftrained, did not afterwards exhibit the leatt light. He then put fome fea-water that had been rendered particularly clear; by repeated filtrations, into a large glafs, and having floated in it a fine cloth; on which he had previoufly collected a number of luminous points, feveral of them were liberated, and became diftinctly vifible in their natural element, by placing the glafs before a piece of dark coloured papes. They were obferved to have a tendency to come to the furface of the water, and after the glafs was fet by for fome time, they were found congregated together, and when thus collected in a body, they had a duky

## LIGHT.

Araw colour, although individually they were fo tranfparent, as to be perfectly invifible, except under particular circumftances. Their fubftance was indeed fo extremely tender and delicate, that they did not become opaque in diltilled vinegar or alcohol, until immerfed in thefe liquors for a confiderable time.

On examining thefe minute globules with the microfcope, he found that they were not quite perfect Spheres, but had an irregular depreffion on one fide, which was formed of an opaque fubtance, that projected a little way inwards, producing fuch an appearance as would arife from tying the neck of a round bag, and turning it into the body.

The motions of thefe creatures in the water were flow and graceful, and not accompanied by any vifible contraction of their bodies. After death they always fublided to the bottom of the veffel.

From the fparkling light afforded by this fpecies, he has given it the name of medufa fciatillans.

The night following that, on which he difcovered the preceding animal, he caught the two other luminous fpecies. One of thefe he has called beroe fulgens.

This molt elegant creature is of a colour changing between purple, violet, and pale blue; the body is truncated before, and pointed behind; but the form is difficult to affign, as it is varied by partial contractions, at the animal's pleafure. He has reprefented the two extremes of form that this creature affumes: the firt is fomewhat that of a cucumber, which, as being the one it takes when at reft, fhould perhaps be confidered as its proper fhape: the other refembles a pear, and is the figure it has in the moft contracted ftate. The body is hollow, or forms internally an infundibular cavity, which has a wide opening before, and appears alfo to have a fmall aperture, pofteriorly through which it difcharges it excrement. The pofterior two-thirds of the body are ornamented with eight longitudinal ciliated ribs, the proceffes of which are kept in fuch a rapid rotatory motion, while the animal is fwimming, that they appear like the continual paffage of a fluid along the ribs. The ciliated ribs have been defcribed by profeffor Mitchell, as arteries, in a luminous beroe, which probably was no other than the fpecies we are now fpeaking of.

When the beroe fulgens fwam gently near the furface of the water, its whole body became occafionally illuminated in a glight degree; during its contractions, a ftronger light iffued from the ribs, and when a fudden fhock was communicated to the water, in which feveral of thefe animals were placed, a vivid flafh was thrown out. When the body was broken, the fragments continued luminous for fome feconds, and being rubbed on the hand, left a light like that of phof: phorus; this however, as well as every other mode of emitting light, ceafed after the death of the animal.

The bemilpherical fpecies of medufa had a very faint purple colour. The largett individuals meafured about three quarters of an inch in diameter. The margin of the umbella was undivided, and furrounded internally by a row of pale brown fpots, and numerous fmall twilted tentacula : four opaque lines croffed in an arched manner from the circumference, towards the centre of the animal ; an opaque irre-gular-fhaped procefs hung down from the middle of the umbella; swhen this part was examined with a lens of high powers, it was difcovered to be inclofed in a fheath in which it moved, and that the extremity of the procefs was divided into four tentacula, covered with little cups or fuckers, like thofe on the tentacula of the cuttle fifh.

This fpecies of medufa bears a ftriking refemblance to the agures of the malufa hemi/pherica, publifhed by Gronovius and Muller ; indeel it difers as little from thefe figures, as
they do from each other. Its luminous property, howeres; was not obferved by thefe naturalifts, which is the more extraordinary, as Multer examined it at night, and fays it is fo tranfparent, that it can only be feen with the light of a lamp. If it gould be ftill confidered as a diftinct fpecies; or as a variety of the bemi/pherica, Mr. Macartney propofes to call it the medufa lucida.
In this fpecies, the central part and the fpot round the margin, are commonly feen to thine on lifting the animal out of the water into the air, prcfenting the appearance of an illuminated wheel, and when it is expofed to the ufual percuffion of the water, the tranfparent parts of its body are alone luminous.

In the month of September 1805, Mr. Macartney had again frequent opportunities of witneffing the luminous appearance of the fea at Herne bay, and of making obfervations upon the animals which occafion it. He found that they always retreated from the furface of the water, as foon as the moon rofe, and that expofure to the day light took away their property of fhining, which was revived by placing them for fome time in a dark fituation.

In that feafon he had two opportunities of feeing an extended illumination of the fea, produced by the above animals. The firit night he faw this fingular phenomenon was extremely darik, many of the meduya fcintillans, and medufa bemi/pberice had been obferved at low water, but on the return of the tide they had fuddenly difappeared. On looking towards the fea, he was aftonifhed to perceive a flafh of light, about fix yards broad, extend from the fhore, for apparently the ditanee of a mile and a half along tho furface of the water. The fecond time that he faw this fort of light'spoceed from the fea, it did not take the fame form, but was diffured over the furface of the waves next the fhore, and was fo ftrong, that he could for the moment difinetly fee his fervant, who ftood at a little diftance from him ; who alfo perceived it, and called out to him at the inftant. On both thefe occaíons the flath was vifible for about four or five feconds, and although he watched for a confiderable time, it was not repeated.
A diffuled luminous appearance of the fea, in fome refpects different from this, has been defcribed by fereral navigators.
Godeheu de Riville faw the fea affume the appearance of a plain of fnow on the coatt of Malabar. Mem. Etrang. de l'Acad. des Sc. tom. iii.

Captain Newland, in a paper publifhed in the Journal de Phyfique, ftates that he has feen the fea appear like milk for a few nights. Cook and Peroufe alfo obferved it to be $\mathbf{2}$ ftraw colour.

Father Bourzes, in his voyage to India in 1704, faw what he called luminous vortices in the fea, which he faid appeared and difappeared fuddenly at certain periods, like flaftes of lightning.

Captain Horburg, in the notes he gave to fir Jofeph Banks, fays there is a peculiar phenomenon fometimes feen within a few degrees diftance of the coaft of Malabar, during the rainy monfoon, which he had an opportunity of oblerving. At midnight the weather was cloudy, and the fea was particularly dark, when fuddenly it changed to a white flaming colour all around. This bore no refemblance to the fparkling or glowing appearance he had obierved on other occafions in feas near the equator, but was a regular white colour, like milk, and did not continue more , than ten minutes. A fimilar phenomenon, he fays, is frequently feen in the Banda fea, and is very alarming to thofe who have never perceived or heard of fuch an appearance before.

## LI G H T.

This fingular phenomenon appears to be explained by fome obfervations communicated to Mr. Macartney by Mr. Lang ttaff. In going from New Holland to China, about half an hour after funfet, every perfon on board was aftonifhed by a milky appearance of the fea: the fhip feemed to be furrounded by ice covered with fnow. Some of the company fuppofed they were in foundings, and that a coral bottom gave this curious reflection, but on founding with go fathoms of line no bottom was met with. A bucket of water being hauled up, Mr. Langftaff examined it in the dark, and difcovered a great number of globular bodies, each about the fize of a pia's head, linked together. The chains thus formed did not exceed three inches in length, and emitted a pale phofphoric light. By introducing his hand into the water, Mr. Langllaff raifed upon it feveral chains of the luminous globules, which were feparated by opening the fingers, but readily re-united on being brought again into contact, like globules of quickfilver. The globules were fo tranfparent, that they could not be perceived when the hand was taken into the light.
This extraordinary appearance of the fea was vifible for two nights. As foon as the moon exerted her influence, the fea changed to its natural dark colour, and exhibited diftinct glittering points, as at other times.

This account of Mr. Langftaff is very important, as it proves that the diffufed light of the fea is produced by an affemblage of minute medufa on the furface of the water.
In June 1806, at Margate, Mr. Macartney collected a great number of the fmall luminows medufa. A bucket of the water being fet by for fome time, the animals fought the furfake, and kept up a continual fparkling, which was occafioned by the motions of individuals, as the water was perfectly at reft. A fmall quantity of the luminous water was put into a glafs jar, and on flanding fome time, the medufac collected at the top of the jar, and formed a gelatinous mafs, one inch and a half thick, and of a reddifh or mud colour, leaving the water underneath perfectly clear.

In order to afcertain if thefe animals would materially alter their fize, or affume the figure of any other known fpecies of medufa, Mr. Macartney kept them alive for 25 days, by carefully changing the water in which they were placed; during which time, although they appeared as vigorous as when firft taken, their form was not in the flighteft degree altered, and their fize but little increafed. This experiment confirmed his opinion of their being a diftinct fpecies, as the young aclinie and meduf\& exhibit the form of the parent in a much fhorter period than the above.
In September 1806, he took at Sandgate allo a number of the beroe fulgens: they were of various dimenfions, from the full fize down to that of the medufa fintillans: they could, however, be clearly diftinguifhed from the latter fpecies by their figure.
In April r8og, Mr. Macartney caught a number of the beroe fulgens in the fea at Haftings; they were of various fizes, from about the half of an inch in length, to the bulk of the head of a large pin. Many of them adhered together in the fea; fome of the larger fort were covered with fmall ones, which fell off when the animals were handled, and by a perfon unaccuftomed to obferve thefe creatures, would have been taken for a phofphoric fubbtance. On putting a number of them into a glafs, containing clear fea-water, they ftill fhewed a difpofition to congregate upon the furface. It was obferved that when they adhered together, they fhewed no contractile motion in any part of their body, which explains the caufe of the pale or white
colour of the diffufed light of the ocean. The flafhet of light which Mr. Macartncy faw come from tnu fea as Herne bay, were probably produced by a fudden and general effort of the medufa to feparate from each other, and defeend in the water.

The medufa fiantillans almof conflantly exits in the dif. ferent branches of Milford haven that are called pills. Mr. Macartney fometimes found thefe animals colleeted in fuch valt numbers in thofe fituations, that they bore a confiderable proportion to the volume of the water in which they were contained: thus, from a gallon of fea-water in a luminous ftate, he ftrained above a pint of thefe medufa. The fea under fuch circumftances yields more fupport in fwimming, and the water taftes more difagreeably than ufual; probably the difference of denfity, that has been remarked at different times in the water of the fea, may be referred to this caufe.
Mr. Macartney concludes that the medufa feintillans is the ufual caufe of the luminous appearance of the fea, not only around this country, but in other latitudes. Belides the places already mentioned, he has found this fpecies on dif. ferent parts of the coafts of Suffex, at Tenby, and in the bays of Dublin and Carlingford in Ireland. Many writers, he obferves, have miftaken this fpecies of medufa for the nereis nodiluca, and fome navigators have actually defcribed the medufa finutillans, without being aware of its nature. Mr. Bajon, during his voyage from France to Cayenne, collected many luminous poists in the fea, which he fays, when examined by a lens, were found to be minute foheres. They difappeared in the air. Dr. Le Roy, in failing from Naples to France, obferved the fparkling appearance of the fea which is ufually produced by the medufa fcinsillans. By filtering the water, he feparated luminous particles from it, which he preferved in fpirits of wine: they were, he fays, like the head of a pin, and did not at all refemble the nereis noaituca, defcribed by Vianelli; their colour approached a yellow-brown, and their fubitance was extremely tender and fragile. Notwithitanding this flriking refemblance to the medufa fcintillans, Le Roy, in confequence of a preconceived theory, did not fuppofe what he faw, were animals, but particles of an oily or bituminous nature. Obferv. fur un lumiere produite par l'Eau de la Mer. Mem. Etrang. des Sc.

The minute globules feen by Mr. Langftaff in the Indiah ocean, in all probability, were the fcintillating fpecies of medufa; on his feeirg fome of thefe animals that had been preferved in fpirits, he entertained the fame opinion.

Profeffor Mitchell, of New York, found the luminous appearance on the coait of America, to be occafioned by minute animals, that, from his defcription, plainly belonged to this fpecies of medufa, notwithftanding which, he fuppofed them to be a number of the nereis noziluca. Phil. Mag. vol. x. p. 20.

The luminous aumalcule, difcovered by Forter off the Cape of Good Hope, in his voyage round the world, bears fo ttrong a refemblance to the medufa fintillans, that there is every reafon for believing them the fame. He defcribes his animalcule as being a little gelatinous globule, lefs than the head of a pin; tranfparent, but a little brownifh in its colour; and of fo foft a texture, that it was deltroyed by the flightelt touch. On being highly maguified, he perceived on one fide a depreflion, in which there was a tube that paffed into the body, and communicated with four or five inteltinal facs.

Many writers have afcribed the light of the fea to otlier caufes than luminous animals. Martin fuppofes it to be occafioned by putrefaction: Silberfchlag believed it to be phofphoric;
phofphoric: profffor T. Maycr conjectured, that the furface of the foa imbilech licht, which it afterwards difcharged. Buion and Gentil thought the light of the fea was electric, be aufe it was excited hy friction. Fortter conceised thet it was fonctimes clectric, fonetimes cauled from putrefaction, and at whers by the prefence of lising animals. Fongeroux do Bondaroy believed that it came fometimes frons electric lires, but more frequently from the putrefaction of marine animals and plants.

It is unneceffary to enter into a difcullion of the above opinions: their authors have not attempted to fupport them by any argument or experiments; they merely gave them as fpeculations. It is fufficient to flate, that they are contradicted by all the beft obfervations upon the fubject.

The only animals which are known to poffers ditinct organs for the procuction of light are, the luminous fpecies of impyris, elater, fulyora, and faufus. Of thefe Mr. Macartney has given the following defcription.

Whe light of the lampyrides is known to proceed from fome of the laf rings of the abdomen, which, when not illuminated, are of a pale yellow colour. Upon the internal furface of thele rings, there is fpread a layer of a peculiar foft yellow fubltance, which has been compared to patte, but by examiuation with a lens, I found it to be organized like the common interititial fubltance of the infect's body, except that it is of a clofer texture, and a paler yellow colour. This fubltance does not entirely cover the inner furface of the rings, being more or lefs deficient along their edges, where it prefents an irregular waving outline. I have oblerved in the glow-worm, that it is abforbed, and its place fupplied by comron intertitial fubfance, after the feafon for giving light is paft.

The fegments of the abdomen, behind which this peculiar fubitance is fituated, are thin and trapfparent, in order to expofe the internal illumiation.

The number of luminous rings varies in different fpecies of lampyris, and, as it would feem, at different periods in the fame individual.

Befides the luminous fubftance above defcribed, 1 have difcovered in the common glowestorn, on the inner fide of the laft abdominal ring, two bodies, whicli to the naked eye appear more minute than the head of the fmalleft pin. They are lodged in two llight depreffions, formed in the fhell of the ring, which is at theie points particularly tranfparent. Cn examining thefe bodies under the microfcope, I found that they were facs containing a foft yellow fub. ftance, of a more clofe and homogeneous texture, than that rwhich lines the inner durface of the rings. The membrane forming the facs appeared to be of two layers, each of which is compofed by a tranfparent filvery fibre, in the fame manner as the internal membrane of the refpiratory tubes of infects, except that, in this cafe, the fibre paffes in a fpiral, inftead of a circular direction. This membrane, although fo delicately confructed, is fo elaltic as to preferve its form after the fac is ruptured, and the contents difcharged.

The light that proceeds from thefe facs is lefs under the controul of the infect, than that of the luminous fubltance fpread on the rings: it is rarely ever entirely extinguihed in the feafon that the glow-worm gives light, even during the day; and when ail the other rings are dark, thefe facs often flhine brightly.

The circumitance of there being points, which give a more permanent light than the other parts of the luminous sings of the abdonen, has been noticed before by the Conte :G. de Rayoumouiki. He flates the number of thefe luminous points to vary from two to five. Riem de la Soc. de Laustame, tom. iu.

I mult however remark, that I never faw more than two of thefe luminous points, which were always upon the $\ln$ (t ring of the body, and that the figures which accompany the memoir of the Comte de Razoumoufki, bear farcely any refemblance to the infect they are interded to reprefent, from which we may fairly fufpect him of inaccuracy in other particulars.

As far as my obfervation has extended, the fmall facs of luminous fubtances are not found in any fpecics of lampyris, except the glow-rworm of this country. "Thunburg mentions that the lampyris japonica has two veficles on the tail, which afford light.

The organs for the production of light in the genus elater are fituated in the corcelet; thefe likewife confitt of a peculiar yellow fubitance, placed behind tranfparent parts of the fhell, which fuffer the natural colour of this fubliance to be feen through them in the day, and when illuminated, give paffage to the light.

On diffecting the organs of light in the elater nocilucus, I found that there is a foft yellow fubftance, of an oval figure, lodged in the concavity of the yellow fpots of the corcelet, which parts are particularly thin and tranfparent in this fpecies. This fubftance is fo remarkably clofe in its ftructure, that at firt view it appears like an inorganic mafs, but with a lens it is readily perceived to be compofed of a great number of very minute parts or lobules clofely preffed together. Around thefe oval maffes, the interflitial fubftance of the corcelet is arranged in a radiated manner, and the portion of the fhell that immediately covers the irradiated fubftance is in a certain degree tranfparent, but lefs fo than that which lies over the oval maffes; it is therefure probable, that the intertitial fubitance in this fituation may be endowed with the property of fhining. A fafciculus of the mufcles of the corcelet arifes in the interior of the oval maffes of the luminous fubftance, bat not apparently with any defign, as it contributes, with the adjacent fafciculi, to move the anterior feet.

In the elater ignitus, the maffes of luminous fubtance are extremely irregular in their figure : they are fituared nearly at the pofterior angles of the corcelet, and are more loofe in their texture than the oval maffes of the mocilucus, refembling rather, in compofition, the intertitial fublance which furrounds thefe maffes in that fpecies. The fhell of the corcelet is fomewhat thinner, and more tranfparent along both fides of the margin, than at other places, but it is not, as in the nociliucus, elevated, and peculiarly clear and thin immediately, over the feat of the luminous organ; confequently, the light emitted by the elater ignitus cannot be very brilliant.

I have not been able to procure any fpecimen of the elater phofphorea, but from the accounts of naturalifs, it appears to refemble in every refpect the elater nocilucus.

I have had an opportunity of examining, preferved in a moift way, two fpecies of fulyora, the candelaria and lanternaria. The light in this genus has been obferved to iffuc from the remarkable probofcis on the fore part of the head: This part has always been defcribed by authors as hollow or empty, which I have found to be perfectly correct ; and what is more extraordinary, that the cavity communicates freely with the external air, by means of a chink or narrow aperture, placed on each lide of the root of the probofcis. This projection is covered internally by a membrane, between which and the horny part or fhell, there appears to be interpafed a pale reddifl coloured foft fubltance, that is arranged in the candelaria in broad lines or Atripes; but it is fo ibin, that I could not diftinetly examine its flructure, or abfodutely determine, whether it thould be confidered as a fub-
ftance

Aance intended to furnifh the light of thefe infects, or the pigment upon which the colour of the probofcis depends.

The globes of the antennx conflitute the organs of light in the paufus $\int$ pherocerus. Dr. Afzelius, who difcovered the luminous property in this fpecies, compares them to lanterns fpreading a dim phofphoric light. (Linn. Tranf. vol. iv.) The rarity of the infect put it out of my power to examine its ftructure, but from the form and fituation of its organs of light, it is molt probable they are conltructed like thofe of the fulgore.

It has been conjectured by Carradori and others, that the lannpyrides were enabled to moderate or extinguifl their light, by retracting the luminous fubltance under a membrane; but neither in them, nor any of the other luminous infects, have I found an apparatus of this fort. The fubitance furnifhing the light, is uniformly applied to correfponding tranfparent parts of the fhell of the infect from whence it is not moved; indeed a nembrane, if it did exift, would have but little effect in obfcuring the light, and never could ferve to extinguilh it. The regulation of the kind and degree of the luminous appearance, does not depend upon any vifible mechaniim, but, like the production of the light itfelf, is accomplifhed by forne inferutable change in the luminous matter, which in fome animals is a fimple operation of organic life, and in others is fubject to the will.

It is worthy of remark, that in all the diffections I have made of luminous infects, I did not find that the organs of light were better, or differently fupplied with either nerves or air tubes, than the other parts of the body. The power of emitting light likewife exifts in many creatures which want nerves, a circumitance ftrongly marking a difference between animal light and animal electricity. Phil. Tranf. 1810, part ii.

With the exception of the animals above-mentioned, the extibition of light depends upon the prefence of a fluid matter.

In the pholas dalylus, the luminous fluid is particularly evident, and in valt quantity.

The fhining of the fcolopendra electrica is obferved to be accompanied by the appearance of an effufion of a luminous fluid upon the furface of the animal, more particularly about the head, which may be received upon the hand, or other bodies brought into contact with the infect at the moment, and thefe exhibit a phofphoric light for a few feconds afterwards. This fluid, however, it is impofible to difcover in the form of moifture, even upon the clearelt glafs, although examined immediately with the moft fcrupulous attention by a lens: it muft therefore be extremely attenuated.

The fame appearance has been obferved during the illumination of the nercis noctiluca by Fougerous de Bondaroy. 3 Iem. de l'Acad. des Sc. 1767 .

The animal difcovered by Riville fhed a blue liquor, which illuminated the water for a diftance of two or three Hines. Mem. Etrang, de l'Acad des Sc. tom. iii.

Spallanzani relates, that the madufa which he examined, cormmunieated the property of Shining to water, milk, and other suids, on being rubbed or fqueezed in them. Spallanzani's T'ravels in the Two Sicilies, vol. iv.

The luminous fluid is in fome intances confined to parsicular parts of the body, and in others is diffufed throughout the whole fubltance of the animal.

In the fcolopendra electrisu, it appears to refide immediately under the integuments. In the lynceus difcovered by Riyille, it is contained in the ovary. Mr. Macartney believes that every part of the body of the medufa is furnifhed with this fluid, as there is no part that is not feen illuminated Vul. XX.
under different circumflances, but Spallanzani affirms that it is only found in the large tentacula, the edges of the umbella, and the purfe or central mafs; which he prosed, he fays, by detaching thefe parts fuccelfively, when they thone vividly, while the rett of the body neither gave light nor comntunicated any luminous appearance to water. Memoria fopra le medufe fosforiche. Mem. della Soc. Ital. tom. vii.
Spallanyani difcovered a mucous luminous fuid in the plumule of the pennatula phopphorea. Men della soc. Ital. tom. ii.

The phenomenon of animal light has been attempted to be explained in different ways. By many perfons it was formerly afcribed to a putrefactive procefs, but fince the modern theories of combuttion became known, it has been generally believed to depend upon an actual inflammation of the luminous fubtance, fimilar to the flow combution of phofphorus. Others have accounted for the luminous effect, by fuppofing the matter of light to be accumulated, and rendered latent ender particular circumflances, and afterwards evelved in a fenfible form.

The opinion of the light of living animals being the confem quence of purrefaction, is evidently abfurd, aod contradietory to all obfervation on the fubject. It has been proved by the experiments of Dr. Hulme and others, that even the luminous appearances of dead animals are exhibited ouly during the firlt Itages of the diffolution of the body, and that no light is emitted after putrefaction has really cormmenced.

Spallanzani, who was the moft trenuous advocate for the phasphorefcent nature of animal light, fated that glowworms fhone more brilliantly when put into oxygen gas; that their light gradually difappeared in hydrogen or in azotic gas, and was inftantly extinguithed in fixed air; that it was alfo lott by cold, and revived by the application of a warm temperature. He conjectured that the luminous matter of thefe infects was compofed of hydrogen and carbonated hydrogen gas.
Fortter relates, in the Lichtenberg Magazine for 178 3. that on putting a lampyris Jplendidula into oxygen gas, it gave as much light as four of the fame fecies in common air.
Carradori has made fome experiments upon the lucciol, (lampyris italica) which led him to deny its phofphorefcence. He found that the luminous portion of the belly of the infect fhone in vacuum, in oil, in water, and different liquids. and under different circumftances, where it was excluded from all commanication with oxygen gas. He accounts for the refult of Fortter's experiment, by fuppofing, that the worm thone mare vividly, becaufe it was more animated in oxygen gras than in common air.
Carraduri adopts on this fubject, the doctrine of Brugna. telli, and afcribes the luminous appearances of animals to the condenfation and extrication of light in particular organs, which had previoully exitted in combination with the fubitance of their bodies, fie fuppofes the light to be originally derived from the food, or the atmofpheric air taken into the body; in fhort, that certain animals have the peculiar property of gradually imbibing light from foreign bodies, and of afterwards fecreting it in a fentible furm. Annal di Chimica. tom, xiii. 1797.

The following experiments, which were lately made upon this fubject by Mr. Macartney, would lead to different con. clufions than thofe of the preceding authors.

Experiment 1.-A glose-suorm was put into a glafs of water, in which it lived nearly two hours, and continued to emit light as ufual, until it died, when the luminous appearance entirely ceafed.

Experiment
F.geriment 2.-The luminous futance was extracted from the before-mentioned glow-worm, and from others killed in different ways, but it afforded no light.

Experiment 3.-The facs containing the luminous matter were cut from the bellics of living glow-worms, and fhone uninterruptedly for feveral hours in the atmofphere, and after their light became extinct, it was revived by being moiltened with water; fome of thefe were put into water in the firtt inflance, in whinch they continued to fhine unremittingly for forty -cight hours.

Experiment 4.-The luminous fubitance of a giverworm was expofed to a degree of heat which would have been fufficient to inflame phofphorus, without increaling the brilliancy of its light; and farther, it could not be made to burn by being applied to a red hot iron, or to the Hame of a cande.

Experiment 5-A delicate thermometer was introduced amongit fome livings glow-worms, during the time they gave out much light: the temperature of the room being $69^{\prime \prime}$, the inftrument rufe to $75,76^{\circ}$, and $77^{\circ}$, according to circumblances, as the warinth was refected from the hand, or difipated by the worm cravling over cold fubftances. The luminous portion of the tail, when very brilliant, appeared to raife the thermometer more quickly than the other parts of the body; but it was not invariably the cafe. When thining ftrongly, the lumineus rings appeared to communicate the fenfation of warmeth to the hand; but this was probably a decertion, as the actual degree of heat was not fufficient for fuch an effect. It fhould however be mentioned, that in 'Templar's obfervations on the glow-worm, he faid his feelings deceived him, if he did not experience fome heat from the fhining of the infect. Phil. Tranf. $\mathrm{N}^{\circ} 72$.

Experiment 6.- To afcertain how far the evolution of heat, during the fhining of glocw-cworins, depended upon the life of the animals, the luminous portion of the tail was cut off from feveral living worms: if the thermometer was applied to them inumediately, it was, raifed by them one or two degrees; but after thefe parts.were dead, although they continued to emit light, they produced no effect whatever upon the initrument.

Experiment 7 .--Some bemipherical medufe were put into a fpoon, containing a fmall quantity of fea-water, and held over a burning candle. As foon as the water became heated, the medufe appeared like illuminated wheels; the fpots at the margin and centre alone emitting light ; in which manner they fhoie vividly and permanently for about twenty feconds, when they fhrunk and died, after which they were no longer luminous.

Experiment S .-Some of the fame fpecios were put into Spirits: a trong and uuremitting light was inftantly given out, which iffued from the central and marginal parts, as in the preceding expcriment, and continued until they died.

Experinn: nt 9.-Some of the fintillating and bemi/pherical Species of mectuja, contained in a fmall glafs jar, were introduced into the receiver of an air-pump, and the air being eshauited, they fhone as ufual when flaken: if any difference could be perceived, the light was more eafily excited, and continued lo:grer in vicuum.

Experiment 10.-A medufa bemippherica was placed in a friall glafs dith, contaiuing a quantity of water, merely fufficient to allow the animal to preferve its figure: being infulated, it was eleetrified, and fparks drawn from it, which frad not the tliyhteft effect. The experiment was repeated Feveral times with different individuals, but without exciting the animals to throw out light.

E-verinant in.-Some benijpherical medufe were placed in contatt with the two ends of an interrupted chain, and
flight clectric fhocks paffed through them.' During the very moment of their receiving the flock, no lighe was vifible; but impmediately afterwards the medufa fhone like illuminated wheels, which appearance remained for fome feconds. Upon the clofeft infpection with a magnifying glafs, no contractile motion could be perceived to accompany the exhibition of the light. The application of electricity, in this inftance, feems to have acted merely as a ttrong mechanic fhock.

It feems proved by the foregoing experiments, that fo far from the luminous fubfance being of a phofphorefcent nature, it fometimes fhews the ftrongeft and moft conftant light, when excluded from oxygen gas; that it, in no circumflances, undergoes any procefs like combultion, but is actually incapable of being inflamed; that the increafe of heat, during the flhining of glow-worms, is an accompaniment, and not an effect of the phenomenon, and depends upon the excited ftate of the infect; and, laitly, that beat and electricity increafe the exhibition of light, mevely liyg operating like other flimuli upon the vital properties of the animal. Phil. Tranf. I8ıo, part ii.

In addition to thefe opinions, we may mention that profeffor Davy has found that the light of the glorv rworm is not rendered more brilliant in oxygen, or in oxygenated muriatic gas, than in common air ; and that it is not fenfibly diminifhed in hydrogen gas.

We may further add, that Spallanzani's experiments of diffufing the laminous liquor of the medufa in water, milk, and other fluids, are in direct contradiction of his own theory, as is alfo the extinction of the light of thefe mixtures by the application of a high degree of heat.

If the light emitted by animals were derived from their food, or the air they refpire, as fuppofed by Carradori, the phenomenon fhould be increafed or diminifhed; according to the quantity of food or air that the creatures confume. But we do not find this to be the cafe; for in thofe lituations where they are fometimes found to be moft luminous; they are deprived, in a great meafure, of thefe affumed fources of their light.

In fact, the luminous exhibitions of living animals are not only indcpendent of all foreign light, but are frequently deftroyed by the latter. The fhining of the medufe was always found by Mr. Macartney to ceafe upon the rifing of the moon, or at the approach of day; and when out of the iea, he never could excite them to throw out light until they had been kept for fome time in the dark: all the luminous infects likewife fecrete themfelves as much as poffible during the day-time, and go abroad only at night. It is. true that the fcolopendra elegrica will not dhine, unlefs it has been previoufly expofed to folar light ; but it is to be obferved that it fhone as brilliantly and as frequently, after being kept a fhort time in a light fituation, as when left uncovered the whole day. The circumintance of the foolopendra requiring expofure previous to its giving out light; is very unaccountable, as the infect, when left to itfelf, always feeks as much as poffible concealment during the day: indeed it is the opinion of fome naturalifts, that it is killed by the light of the fun.

We fhall terminate this article with the following conclisfions, drawn by Mr. Macartney from his own obfervations, and from a careful review of all that had been written on the fubject.

The property of emitting light is confined to animals of the fimpleft organization, the greater number of which are inhabitants of the fea. The lumino:s property is not cenftant, but in general exiths only at certain periods, and in particular ftates of the anima.'s budy. The power of thew-

## LIGHT.

ing light refides in a pecuiliar fubftance or 䏠d, which is fometimes fituated in a particular organ, and at others diffufed throughout the animal's body. The light is difierently regulated, when the luminous matter exits in the living body, and when it is abftracted from it. In the frrt cafe, it is intermitting, or alternated with periods of darknefs; is commonly produced or increafed by a mufcular effort; and is fometimes abfolutely dependent upon the will of the animal. In the fecond cafe, the luminous appearance is ufually permanent until it becomes extinct, after which it may be reitored directly by friction, concuffion, and the application of warmth; which laft caufes operate on the luminous matter (while in the living body) only indirectly, by exciting the animal. The luminous matter, in all f:tuations, fo far from poffeffing phofphoric properties, is incombultible, and lofes the quality of emitting light, by being dried, or much heated. The exhibition of light, howeser long it may be continued, caufes no diminution of the bulk of the luminous matter. It does not require the prefence of pure air, and is not extinguifhed by other gafes.

The luminous appearance of living animals is not exhaulted by long continuance, or frequent repetitions, nor accumulated by expofure to natural light: it is, therefore, not dependent upon any foreign foarce, but inheres as a property, in a peculiarly organized animal fubftance or fluid, and is regulated by the fame laws which govern all the other functions of living beings.

The light of the fea is always produced by living animals, and mott frequently by the prefence of the medufiz fintillans. When great numbers of this fpecies approach the furface, they fometimes coalefce together, and caufe that fnowy or milky appearance of the fea, which is fo alarming to navigators. Thefe animals, when congregated on the furface of the water, can produce a flah of light, fomewhat like an electric corrufcation. When the luminous medufa are very numerous, as frequently happens in coulined bays, they form a confiderable portion of the mafs of the fea, at which times they render the water heavier, and more maufeous to the tafte : it is therefore advifeable to always ftrain feaswater before it is drunk.

The luminous property does not appear to have any connection with the economy of the animals that poffers it, except in the flying infects, which by that means difcover each other at night, for the purpofe of fexual congrefs.

In the plates for illultrating the prefent fubject in this dictionary, the reader will only lind figures of thole luminous animals which are not generally contained in books on natural hiltory, or which are neceflary fur the explanation of lately difcovered facts.
Fig. I. is the nereis noailuca, difcovered by Vianelli, of the natural fize.

Fiz. 2. Shews the fame animal greatly magnified: " $a$ is the hend, furnifhed with two flort antcuna and a horn-like procefs; $l, b$, the two eves; $c, c, c$, fome of the lateral twifted proceffes proceeding from the fegments of the body; $d, d, d$, fome of the other lateral proceffes that contain the tufts.

Fig. 3. is the cruflaceous infed, difcovered by Riville: $a$ is the tranfparent fhell, through which the internal parts of the animal are vitible; $b$, the lac containing the inteltines; $c$, one of the four-jointed fetaceous antenne; $d$, the two feet armed with hooks; $\varepsilon$, the foot which terminates in claws; $f$, the ova, which Riville miftook for globules containing a luminous oily fluid.

Fig. 40 exhibits the cancer fulgens, difcovered by fir Jofeph Banks. It is given of the hatural fize.

Fig. 5. reprefents the linuthes nocilucus, difoovered by captasn Horburg, greatly magnified.

Fig. 6. is the madrufit pellucens, difcovered by fir Jofeph Banks, fhewn lefs than the natural fize.

Fit. 7. is the fijrefoma cutlanticum, lataly difcovered and defcribed by Peron.

Fizg. 8. fhews the medufit lucida, defcribed by Mr. Macartney, of the largelt lize he nee with.
Fig. 9. is the deroe fulgens, difcovered by Mr. Macartney. It is reprefented of the ufual fize, and in the clongated form the creature affumes when in the act of fwimming. On the pofterior part are feen the ciliated ribs, which conflitute its infruments of locomotiun.

Fig. 10. Thews the medyfis faintillans, difcovered by Mr. Macartney, as it appears the naked eye.

Fig. In. is the fame hughly magmified, by which the opaque parts upon the fide and in the centre of the animal are made apparent.

Fig. 12. is the animalcule, difcovered by Mr. Forter, of the fize it appears to the naked eye.
Fig. 13. exhibits a microfoopic view of the fame animalcule.

Fig. 14: is an enlarged view of the inferior furface of the abdomen in the lampyris lucida, after the integuments had been remored, as delineated by Mr. Macartney : $a, a, a$, reprefent the three maffes of luminous fuleftance, which are applied to the three latt rings of the abdomen ; $b, b, b$, the arrangement of the cellular or intertitital fubltance on the other abdominal rings, which gives the pale colour to the whole belly of this infect.

Fig. 15: reprefents the common glow-worm, with the lower portion of the back cut away, to expofe the facs of luminous matter in fitu on the latt ring of the belly: $a$ indicates the fac of one fide; the inteftine is feen to lie between them.
Fig. 16. is one of the light facs of the glozu-zoorm, taken out and prodigiounly magnified, in order to fhew its flructure, as defcribed by Mr. Macartney: a the external part of the fac, which is compofed of the interweaving of a fpiral fibre; $l$, the luminous fublidace feen at one end, when the fac has been ruptured to expofe its contents.

Fig. 17. is the elator nocitilucus, with the fhell of the corcelet remored on one dide, by which the organ of light, defcribed by Mr. Macartney, is uncovered; a, the yeilow tranfparent fpot of the corcelet ; $b$, the oval mafs of luminous fubflance furrounded by an irradiation of the interftitial fubitance; $c$, the ends of the mufcies which are on the infide of the corcelet.

Fig. I8. Thews the luminous apparatus of the elater nogilucus, confiderably magnified: a, the radiated appearance of the interltitial fubitance around the oval mals of luminous fubfance : this mafs is feen to confit of a number of fmalier parts; $b$ fhews the arrangement of the interflitial fubftance, when it paffes down between the mufles; $c$, the ends of the mufcles of the back: $d$, the fhell of the corcelet.

Fis. 19. is the elaficr igrizus: $a$ indicates the yellow part of the corcelet; $b$ fhews the fmall mafs of luminous fubftance in this fpecies, the fhell being removed.

Lighe is alfo ufed to lignify the difpofition of objects with regard to the receiving of light.

Thus we fay, a painting is feen in its proper light, when its fituation, with regard to the light, is the fame with that for which it was painted.

Ligilt, in Agriculture and Gardoning. Experience has Thewnits infinite fervice to the growth of vegetables, cortributing exceedingly to facilitate their vegetation, and in5 E. 2

## LIGHT.

ereafe their perfection and duration; as it is obvious molt plants are conliderably more profperous, and attain their perfection in a free expofure, fully open to the light and air, than in flady places the fane is obferved of fruits. Thofe growing in a fituation full to the light of the fun, are in general more large and fair, ripening fooner, and more perfeetly, as to beauty and richnefs of flavour, than fuch as grow in the flase: thefe reafons flould therefore determine us to cultivate moit of the principal plants and fruits in fituations open as much as poffible to the full light and influcnee of the fun; though upon particular occations, and in the heat of funmer, fhady places may be necoffary for fome forts of plants, though not where thaded and darkened by foreading trees, Scc, but a border open above to the full light, and only fhaded from the immediate rays of the fun. For the general crops, a perfectly open, funny, bight fituation, free from the fhade of fpreading trees, is always the molt proper.

And its utility is very evident, from plants growing in garden-frames, green-houfes, \&c. in winter; when, in time of fevere weather, covers or hutters have been continued long over the glafles, fo as to exclude the rays of lighr, they become fickly, grow pale, and affume an unhealthy appearance for a long time; the leaves often decaying or dropping off; and frequently, when the covers are continued very long without the admiffion of light, the whole plant in many forts gradually dwindles and perifhes. Great attention is of courfe requilite in this cafe, when, from the feverity of the weather, the ufe of other covers befides the glaffes is neceffary, to take every opportunity of a favourable day, or even an hour or two of a day, to admit the light as fully as poffible. The fame is alfo the cafe with plants in early hot-beds, fuch as cucumbers, melons, \&cc. which, early in the year, require a covering of mats over the glaftes every night; as when thefe additional covers are applicd too foon in the afternoon, and continued late in the morning, fo as to keep the plants long in darknefs, it is highly difadvantageous to their growth, caufing them to grow weak, pale, and fickly.

As light is, therefore, fo beneficial to plants in general, it fhould be increafed as much as pofiible to thofe in frames, green-houfes, ftoves, \&c. In thefe fituations it may be ufeful to paint the infide of all fuch departments white, to reflect the rays of light as much as poffible, and particularly in the nights, and in the day tinne, when the feverity of the feafon requires covers or fhutters to be placed over the glafles or other conveniences where plants are kept.

The author of Phytologia remarks, that the contef for light, as well as for air, which is fo vifible in the growth of vegetables, thews the former to be of great confequence to their exitence, as well as the latter. Thus many flowers follow the fun during the courfe of the day, by the nutation of the italks, not by the rotation of them, as obferved in the fun-Hower by Dr. Hales; and the leaves of all plants endeavour to turn their upper fupface to the light, which is their refpiratory organ, or lungs. The great ufe of all plants turning the upper furfaces of their leaves to the light is thus, he thinks, intelligible; the water peripired from thofe furfaces is, he conceives, hyper-oxygenated; and, as it efcapes from the fharp edges of the months of the perfining veffels, when acted upon by the fun's light, gives out oxygen : whichoxygen, thus liberated from the perfipired water, and added to that of the common atmofphere, prefents to the refpiratory terminations of the pulmonary arteries on the upper furfaces of leaves an atmofphere more replete with vital air. This neceffity of light to the refpiration of vegetables
is fo great, that there is reafon to believe that many plants de not refpire during the night, but exift in a torpid ftate, like the winter fleeping infects. Thus the mimofa, fenfitive-plant, and many others, clofe the upper furfaces of their oppofite leaves together during the night, and thus preclude them both from the air and light; and the internal furfaces of innumerable flowers, which are their refpiratory organs, are clofed during the night, and thus unexpofed both to light and air. It is, however, obferved, that the fungi, which are termed vegetables; becaufe they are fixed to the earth, or to the flones, trees, or timber, where they are found, can exitt without light or much air; as appears in the truffle, which never appears above ground, and by other fungi, which grow in dark cellars ; and in efculent mufhrooms, which are cultivated beneath beds of thraw. The etiolation, or blanching of vegetables, depends upon the keeping of the light from them.

It is further noticed that the element of light, as well as that of heat, is neceffary to vegetation. In this climate they both feem, in general, to be injurious only by their delect, and feldom by their excefs. But as light acts as a ftimulus on the more irritative or fenfitive parts of plants, which appears by the expanfion of many flowers, and of fome leaves, when the fun flines on them; and by the nutation of the whole flower, as of the fun-flower (helianthus), and by the bending of the furmmits of all plants confined in houfes towards the light; there may be difeafes owing to the excefs of this Atimulus, which have not been attended to ; to prevent which the flowers of tragopogon falfafi, and of other plants, clofe about noon. Other unoblerved difeafes may be owing to a defect of the ttimulus of light ; as a mimofa, fenfitive plant, which had been s.onfined in a dark room, did not open its foliage, though late in the day, till many minutes after it was expoled to the light. The excefs of light has not, however, been obferved to be attended by vegetable difeafes in thefe more northern latitudes fo much as in ethers.

Light, in the Manegre. A horfe is faid to be light, in French un cheval leger, that is, a fwift, nimble runner. We likewife call a horfe light that is well made, though he is neither fwift nor active: for in this laft expreffion we confider only the flape and make of a horfe, without regard to his qualities.

Light upon the band; a horfe is faid to be fuch, that has a good tractable mouth; and does not relt too heavy upon the bit.
A coach-horfe is faid to be light, when he firs nimbly, and dreads the whip; or wher he has a light trot.

Licire-bellied. A horfe is thus called that commonly has flat, narrow, contracted fides, which make the flank tura up like that of a grey-bound.

## Light-band. See Hand.

Ligut, in Painting, refers only to thofe effects which light (properly fo called) produces upon the furfaces of natural objects; as exhibited by its reflection from them to the eye of an obferver.

With regard to that art, light may be confidered in two ditinct points of view; ziz. as to the natural and the artifio cial effects arifing from it. The former is fimply the effect produced upon the objects in a picture, by the direction in which it is introduced; which being once chofen, becomes a pofitive rule; and from which no variation can be allowed. The latter is ideal, and requires only to be probable or poffible. It relates to the quantity of light employed to illuutrate the character of a fuhjeck, and depends entirely upon the tafte of the artilt ; who, by the ufe of ideal fladows and fictitious lights, may effect a diminution or augmentation to

## I. I G H P.

any proportion he pleafes: Thele, ongether with light and dark colours, form the batis of chiaro-广curo; one of the grand fundamental principles of painting, of which we have already treated under the article Cxameonscume.

As light, when acting upon fubltantial forms, is always accompanied by fhadow, and as they are neceffary adjuncts to each other, we fhall here unite them, and treat of them together. It is by the contralt of each to the other, that the effect of either is produced by colours ; and however paradoxical it may appear, it is neverthelefs true, that light in the art of painting is not more neceflary to produce fadow, than hade is for the production of light. The colours which give the appearance of the former, obtain that efect only, when furrounded with darker ones, which conftitute fhade; without the latter, they would appear nothing more than an uninterefting mafs of one plain tone, without any degree of the quality which is termed luminous; but contrafted by their oppofites in tone, they become brilliant; and when form is fuperadded, obtain the character of lizht. The fame, though in the contrary degree, is the effect of dark hues, which, without the contrait of lighter ones, produce only a heavy, dull, vomeaning mafs, that merits not the appellation of fhade, till oppofed by other tones, and rounded into form by the affiltance of light.

The management of light and thade is the mott important of the practical parts of the art ; fince, without the true arrangement of them, vain mult be every effort of the painter to produce a juft refemblance of thofe things which nature offers to our view, and which are the immediate objects of his ftudy. Outline is but as the fection of a body; and colour, a fimple, unvaried colour added to it, would ftill in no-wife increafe its value as the reprefentative of a fubflancé; but let light and thade be fuperadded, and duly difpofed, and what was a flat furface becomes apparently a rounded one, is relieved from its ground, and ap. pears to flart from the canvas.

The fources of light are in fact but two ; viz. the fun and fire: but to the painter a variety of modifications of thefe two take place, and become equally feparate fources, with diftinet qualities, both as to power and colour. Such, for inflance, are the moon's reflecting power; that of the atmofphere when the fun is hid; and likewife the illumination proceeding from a window into a room. 'The effects produced by each of thefe differ fo widely from thofe of the two former, that we may fairly fay there are five gencral fources of light, at lealt, applicable to the purpofes of painting. Of that proceeding direct from the fun in full blaze, it can only be obferved, that, except for landfcape, its ufe is confmed in the art ; being too poverful, and producing thadows too harfh, for the more interelting and agreeable fubjects of fancy or hiftory. The fofter illumi. nation reflecked from thole parts of the atmolphere oppofed to the fun, is ufually and reafonably preferred; or that which the heavens yield when the fource of its light is hid in clouds, though not when it is too much lolt in the gloom of tempelt ; for then the lights and fhadows become too inditinct and confufed. The open light of the air has another character dittinct from the two juft mentioned: which is, when the fun is but faintly obfeured by thick clouds, through which its rays penetrate with diminifhed luftre, b:tt ftill in direct lines. In this cale the light, though direct and caufing fhadows the fame in form as when its fource is unobferved, is yet but weak and foft; and the fhadows it produces being effected by the general light of the atmofphere, are teader in their outline and tone. When the reffected light procceding from the northern parts of the atmofphere is ad.
mitted through a window into a room, it aftumes a mid-way charafter. For while the light is weaker, and confequently fofter than fun-fhine; the fladows, owing to the fmallnefs of the aperture, become diftinct bus not hark; and their diltinctnefs is heightened by the room wherein is the window, (which may be confidered as an original fource, receiving only a partial quantity of light, and confequently little or no reflection takes place, except from furrounding and contiguous objects upon each other: whereas, when a figure is fo placed in open air as to receive the light reflected from the flyy, it partakes of it in every direction, and wherefore lias little or no fhadow; for there will be few parts whese fome rays of light will not, under fuch circumitances, find admiflion.

When the light proceeds direct from the fun, it is ufual, though not itrictly correct, to conlider its rays as parallel, and corfequently no enlargement or diminution takes place in lencthened thadows. But, in reality, its dittance, which diminithes its fize apparently, added to the effect of peripective, produces a real variation in fhadows of objeets whofe magnitude is at all confiderable. This is always the cafe when the fource of light is larger or fmaller than the illumined body. In the former cafe, the shadow of a fufpended ball would diminifh to a point ; as that of the earth does from the light of the fun: and in the latter it would lilate as it was extended, and projećt a fhadow at a certain dittance, large in proportion to the comparative fmallnefs of the luminous tiody'; as of the flame of a candle, for inltance. compared to a tennis-ball.

Shadows by day-light feldom become totally obfcure: an object mult be placed in a fituation where it could receive very little indeed of that peculiar illumination, without havint fome reflections falling into its thades, and confequently yiclding fome vifible effect of the forms on which they fell. But by fire and candle-light, owing to the confmed iffue of their rays, forms hid in the fhadows they project are often totally lult: neverthelef, thefe thadows are not blacknef, but darknefs, of a colour whofe hue depends upon that of the larger mafs of furrounding bodies. Under many circumitanecs they receive rellections, and lave a confequent degree of colour in the bodies that lie within their range.

There are two caufes which operate to weaken and even deitroy the force of refiected light. 'IThe one is the diftance at which the reflecting object is fituated from the luminary ; the other, the difkance of the fame from the obferver. When thrfe two circumbtances combine, the effect of light and fhade is very weak.

To comprehend the principle upon which the illumination and confequent hadows of objects are produced, and to imitate them the molt effectually, the painter mutt recollect, that light, whencefoever it iffues, proceeds rectilineally from its fource to the furface which intercepts it ; and is reflected in the fame way, at an equal angle wirh the plane of that furface, but in an inverfe direction. In the language of optics, the ancle of refleztion is equal to the angle of incidence. This is the fimple but general rule, which is infallibly to guide the artitt through all the difficulties of hight and thade in painting: whether arifing from direct or reAlected illumination, this one principle holds equally good in all; but the lines which it forms in the fhadows, ere lubject to the variations produced by perfpective on all folid bodies whereon light can act.

The moft important application of this rule the artift will find to be, in fixing upon the precile point where he fhould difpofe of his moft brilliant hues; or what are technically tcrmed his high lighss; which are, in reality, thofe parts of

## LIGHT.

his oligets, where, if the furface be a polifhed one, the image of the iuminary is reflected; and is of courfe that one which, to the eye of an obferser, is most illuminated. Thefe reliections will always be found to take place only on that point from whence a line drawn to the luminary, and another to the cye of the artit, form angles equal to each other with the plane of the furface of the illuminated object. For thuagh it may not in reality be the precife fpot where the greateft number of rajs of light are intercepted by that body, yet it is effectually fo to him whofe eye can only receive thofe which are thrown off in reflection towards him. It may be obferved as a confequence of this rule, that the extreme cdge of a rounded body can fa:cely ever be its brightelt part ; it will, as it recedes from the obferver, lofe to him its luttre, and melt into the ground orobject behind it ; or, if relieved by a flat object equally white with itfelf, a dark line will be feen to mark its boundary, in whatever fituation the fource of light may be, within a right angle with a line drawn from the object to an obferver; or fomewhat beyond that, to nearly $\times 35$ degrees.

It is fearcely neceffary bere to \{peak of the refraction of light from its original courfe, when paffing through various fubilances, as glais or water; except to deprecate paying any attention to it in a picture where any effential form is broken in upon by it ; or choofing fuch fubjects, where deviation from general rules ferve rather to confound than to fatisfy the common underilanding of mankind. Thefe copying the pofitive truth would create confufion, it is molt juat, at leatt molt ureful, to vary from it: as in painting the portrait of a man with fpectacles on. What artilt in his fenfes, and who had a true perception of the real object of ant, would think of painting exaetly that which prefents itfelf to lis view, a pofitive deformity, eyes mifplaced, and of monitrous form ; for fach they are when feen through the glaffes. Such procedure would totally defeat the objeet of portraiture ; for it would be hardly poffible to make a lakenefs of the perfon, with fuch a variation from the pofitive form of his face.

The direction in which the light falls upon the objects introduced into a picture, and which we propofed at the beginning of this article as one of the points of view in which to canfider the fubject, is of very great importance on many accounts, and calls for the molt attentive confideration of the artift before he begins to colour has picture, and even in the compolition of his forms. If, without previous attention to this, he proceeds to execute his compolition, and complete the developement of his ideas, he would be fortunate if he did not find in his progrefs, that the neceffity he was under of making fladows to bring out his forms, very frequently deftroyed his general flapes, which previoufly appeared well when in lines only. A due attention to this, in the firt inftance, would frequently fuggelt ideas of forms, and affitt him in lilling his canvas agreeably, and in exprefsing the charakter of his fubjects appropriately. It is, however, utterly impolible to give precife rules upon this fubject in hiftorical paintings, as it depends fo entirely upon the nature of the fubjects, and the local fituations of the actors introduced. One general rule only may be given, viz, that the difpofition of the figures fhould be fuch, with regard to the fource of light, as to produce ample maffes of light and fladow: either of the ore or the other predominant, accordingly as the fubject is grave or gay. If the fubject be of one fingle figure, then it is requifite (and more eafly to be managed) that care be taken that the light falls upon it in fuch a manner as accords with the action, and produces no unpleafiant flapes. For great grace may be added to
figures by light and nade when agrecably difpofed; and on the contrary, an unfortunate difpofal of them may dininifh the cffect, if not totally deftroy the moft beautifully drawn figure imaginable.
In portraiture, fometbing more precife may be faid upon this fubject. Its object is to convey a refemblance of a perfon in the mott agrceable manner, generally fpeaking; yet therein much muft renain which the rules cannot attach to, particularly where the object is to convey character ftronity, and not merely to render the picture agreeablc. In the latter cafe, if a perfon be fo placed with regard to the window or luminary, that the light falls upon him at an angle of about 45 deg., and the greater part of the face be expofed to it, the purpofe will be anfwered. A ftill more acute angle will give greater relievo, but the effect will not be fo pleafing. Whether the face fhould be turned directly facing the light, or fo as to receive it partially, mult entirely depend upon the character of the features. If large, they will bear a full light; if of a fmaller and more delicate nature, a little inclination from the light will give more force and variety. But where the object is to convey character Itrongly, to the difregard of pofitive beauty, there the character only is the guide, and every angle of illumination, with any turn towards or from it, may effect the object, according to the famp which nature has laid upon the face to be painted.

The angle of 45 deg . or thereabouts, is alfo the belt for the general illumination of a picture while the artift is employed upon it, with fuch an inclination from the fource of light, that no reflection of it is prefented to his eye. . He will, in this fituation of his work to the light, be leatt in his own way, and fee the whole of it together moft effectually; but this is an object of leffer moment; a good artilt need not wait to have his picture precifely in the very beft fituation, to enable him to perform his tafk with pleafure or effect. Indeed he cannot always have it fo, particularly when engaged in adorning walls and ceilings, \&c.

With regard to the fecond divifion of our fubject, or the quantity of light proper to be introduced into a picture, which is a matter that lies entirely at the difcretion of the artift, we mult principaliy refer our readers to what has been faid under the articles Clair-obscure, and Effect, in Painting ; more particularly the latter, where we have fhewn that various mafters have adopted as various quantities, and thade them all agreeable. The fubject, the place, and the time, mult govern this point, and the talte of the artilt muft lead him to decide the matter for himfelf; his only guide is, the moft natural, and at the fame time the molt effective, illuftration of his fubject.

Another point for confideration, is the tone of colour which fhould be given to the light. Of this, alfo, we have treated under the words Effect, in Paining, and Harmony in the fame art, and need only itate here, that whatever hue is adopted, the fame fhould range through the whole picture, except when two kinds of light are introduced, as day-light and candle-light. In that cafe the former will be of a cold colour; and in fituations where fladows from the candle fall over parts illumined by the day, thofe parts, if the object be white, will appear of a light blue, as may be feen when candies are lighted and placed on a table-cloth, where rays of twilight can reach. The warm coldur thrown off by the flame of the candle, imparts its nature to whatever it illumines, and as it is nearly yellow, it renders white and yellow vèry nearly alike in hue, and makes green appear bine, and purple nearly fo. This renders it a difificult matter to paint by candle-light for a day-light exhioition. The artift mult

## LI G H T.

rely very much upon his judgment and previous knowledge of his colours who attempts it, or all the delicate admixture of teints and hues will efcape him. Rubens has very frequently fucceeded in the admixture of lights, and in one picture particularly, his beautiful work of " St . Roch interceding for the unhappy Sufferers from the Plague." And Titian has rendered molt beautifully the effect of three lights, viz. thofe of the day, of fire, and of candle, in his grand work of "The Martyrdom of St. Lawrence ;" and has contrived to produce one harmonious tone over the whole, while each part is characteriftically maintained.

Light, in Sea Language, is ufed in contradiftinction to laden. A thip is accordingly called light, ei her when fhe has no cargo, or when fhe is not fufficiently ballafted.

Light is alfo ufed for the luminous body that emits it. There are various kinds of lights; general lights, as the air ; particular lights, as a fire, a candle, and even the fun.

Lignts, in Architelure, denote doors, windows, and other places, through which the air and light have a paflage.

In the Pantheon, all the light comes from on high; it has no lights but in the dome.

Ligurs, in Garlening, a term applied to the moveable glazed faftes which cover garden and other frames; and which, according to the number of lights, or feparate move-" able glaffes, are denominated one-light, two lizht, and threelight frames; thefe being the moft general different fizes of this fort of frame. See Fiame and Garden-Frame.

Ligits, Feafl of. See Dedication.
Ligits, Stopping, of a boufe, is a nuifance; but ftopping a profpect is not, being only matter of delight, not of neceffity. If a man has a vacant piece of ground, and builds thereupon a houfe, with good lights, which he fells or lets to another; and afterwards builds upon ground contiguous, or lets the fame to another perfon, who builds thercupon to the nuifance of the lights of the firft houfe; the leffee of the firfl houfe may have an action of the cafe againft fuch builder, \&c. And thoush formerly they were to be lights of an ancient meffuage, that is now altered.
Light-borfe, an ancient term in our Englifh cuftoms, fig. nifying an ordinary cavalier, or horfeman lightly armed, and fo as to enter a corps or regiment; in oppofition to the men at arms, who were heavily accoutred, and armed at all points. See Cavalry and Hogse.
